Nonlinear programming, preliminary design problems, performance simulation problems trajectory optimization, flight computer optimization, and linear least squares problems are among the topics covered. The nonlinear programming applications encountered in a large aerospace company are a real challenge to those who provide mathematical software libraries and consultation services. Typical applications include preliminary design studies, data fitting and filtering, jet engine simulations, control system analysis, and trajectory optimization and optimal control. Problem sizes range from single-variable unconstrained minimization to

constrained problems with highly nonlinear functions and hundreds of variables. Most of the applications can be posed as nonlinearly constrained minimization problems. Highly complex optimization problems with many variables were formulated in the early days of computing. At the time, many problems had to be reformulated or bypassed entirely, and solution methods often relied on problem-specific strategies. Problems with more than ten variables usually went unsolved.

Some current research work conducted at the University of Michigan is described to illustrate efforts for incorporating knowledge in optimization in a nontraditional way. The incorporation of available knowledge in a logic structure is examined in two circumstances. The first examines the possibility of introducing global design information in a local active set strategy implemented during the iterations of projection-type algorithms for nonlinearly constrained problems. The technique used algorithms for nonlinearly constrained problems. The technique used combines global and local monotinicity analysis of the objective and constraint functions. The second examines a knowledge-based program which aids the user to create condigurations that are most desirable from the manufacturing assembly viewpoint. The data bank used is the classification scheme suggested by Boothroyd. The important aspect of this program is that it is an aid for synthesis intended for use in the design concept phase in a way similar to the so-called idea-triggers in creativity-enhancement techniques like brain-storming. The idea generation, however, is not random but it is driven by the goal of achieving the best acceptable configuration.

The prediction of optimal shape design for structures depends on having a sufficient level of precision in the computation of structural response. These requirements become critical in situations where the region to be designed includes stress concentrations or unilateral contact surfaces, for example. In the approach to shape optimization discussed here, a means to obtain grid adaptation is incorporated into the finite element procedures. This facility makes it possible to maintain a level of quality in the computational estimate of response that is surely adequate for the shape design problem.

Several examples of spacecraft systems fires are examined. Much of the design, manufacture, inspection, test, and operation of current high pressure oxygen components and systems has been driven by weight, cost, functional, and schedule requirements. As a result, little coordination has been expended on design for safe operation. While the number of oxygen related fires has not been large, their cost, including program losses and delays, has been very large. Most of these failures need not have occurred.

THE PREDICTION OF TRANSONIC LOADING ADVANCING HELICOPTER ROTORS
Roger Strawn and C. Tung Apr. 1986 17 p
(AD-A168217; NASA-TM-88238; A-86198; NAS 1.15:88238; AVSCOM-TM-86-A-1) Avail: NTIS HC A02/MF A01 CSCL 01C

Two different schemes are presented for including the effect of rotor wakes on the finite-difference prediction of rotor loads. The first formulation includes wake effects by means of a blade-surface inflow specification. This approach is sufficiently simple to permit coupling of a full-potential finite-difference rotor code to a comprehensive integral model for the rotor wake and blade motion. The coupling involves a transfer of appropriate loads and inflow data between the two computer codes. Results are compared with experimental data for two advancing rotor cases. The second rotor wake modeling scheme in this paper is a split potential formulation for computing unsteady blade-vortex interactions. Discrete vortex fields are introduced into a three-dimensional, conservative, full-potential rotor code. Computer predictions are compared with two experimental blade-vortex interaction cases.

EVALUATION OF A VISUAL SYSTEM IN ITS SUPPORT OF SIMULATED HELICOPTER FLIGHT Final Report, Sep. 1985 - Feb. 1986
William D. Spears and Winon E. Corley Feb. 1986 113 p Prepared in cooperation with Seville Training Systems Corp.
(Contract N61339-82-D-0006)
(AD-A168829; TR-86-06) Avail: NTIS HC A06/MF A01 CSCL 05/8

The Visual System Component Development Program (VSCDP) was developed by GE under contract with PM TRADE and installed at Williams AFB in spring 1985. Its purpose was to expand the state-of-the-art in visual systems by providing the capability to support nap-of-the-earth (NOE) flight simulation, which requires a high density of visual cues to allow pilots to accurately judge vertical and horizontal distances. The GE system was tested with the computer generated imagery projected in the dome with a radius of 12 feet. The Field of View (FOV) was 140 degrees horizontal by 60 degrees vertical with an enhanced Area of Interest (AOI) of 26 degrees horizontal by 20 degrees vertical inserted in the middle. The imagery centered in pilot's attention regardless of where he was looking in the dome; however, the eye tracker was not functioning for these tests. Nine experienced helicopter pilots participated as subjects. Two kinds of flight mission plans were used: a familiarization flight and a tactical maneuvers flight. The results of the experiment showed that the GE system can support all aspects of helicopter flight simulation. However, problems were found that indicate further work is needed. These included trouble with perceived sizes and distances in the visual scene, and a high incidence of simulator sickness, probably due to processing of motion cues. GRA

INVESTIGATION OF MAGNETOMETER ERRORS AND THEIR COMPENSATION IN THE BO-105 HELICOPTER
Hans-Juergen Hotop and Norbert Nawa Mar. 1986 62 p In GERMAN; ENGLISH summary
(DFVLR-FB-86-21; ISSN-0171-1342; ETN-86-98187) Avail: NTIS HC A04/MF A01; DFVLR, Cologne, West Germany DM 23.50

The errors of a magnetometer as a function of helicopter pitch and roll angles were investigated using flight test data. An error model for compensation is presented. The magnetometer was tested in different locations in the helicopter. Two possibilities of magnetometer error compensation are explained together with their accuracy as a magnetic sensor in an attitude and heading reference system. The use of an on-line algorithm allows compensation during the flight, and hence leads to an improvement of the magnetic attitude information with increasing flight time. ESA

DESIGN OF A TAKEOFF PERFORMANCE MONITORING SYSTEM Ph.D. Thesis
Raghavachari Srivatsan 1985 218 p
Avail: Univ. Microfilms Order No. DA8608473

An algorithm was developed to monitor the performance of the aircraft during the takeoff phase to improve safety in that flight phase. The algorithm is made up of two segments: a pretakeoff segment and a real time segment. One-time inputs of ambient temperature, pressure, runway wind, aircraft gross weight, and selected flap and stabilizer setting are utilized by the pretakeoff segment in generating a set of standard acceleration performance data in an off-line condition. The real-time segment, in addition to the above one-time inputs, requires the runway length available for rotation, the runway length available for stopping, and an estimated runway rolling friction coefficient. The algorithm was evaluated using a six degree-of-freedom nonlinear aircraft simulation as the plant for several design point test cases and two types of engine malfunctions. Dissert. Abstr.

THE 3600 HP SPLIT-TORQUE HELICOPTER TRANSMISSION
Graham White 18 Dec. 1985 95 p
(Contract NAS3-23931)
(NASA-CR-174932; NAS 1.26:174932) Avail: NTIS HC A05/MF A01 CSCL 21E

Final design details of a helicopter transmission that is powered by GE twin T 700 engines each rated at 1800 hp are presented. It is demonstrated that in comparison with conventional helicopter transmission arrangements the split torque design offers: weight reduction of 15%; reduction in drive train losses of 9%; and improved reliability resulting from redundant drive paths between the two engines and the main shaft. The transmission fits within the NASA LeRC 3000 hp Test Stand and accepts the existing positions for engine inputs, main shaft, connecting drive shafts, and the cradle attachment points. One necessary change to the test stand involved gear trains of different ratio in the tail drive gearbox. Progressive uprating of engine input power from 3600 to 4500 hp twin engine rating is allowed for in the design. In this way the test transmission will provide a base for several years of analytical, research, and component development effort targeted at improving the performance and reliability of helicopter transmission. FABRICATION OF COOLED RADIAL TURBINE ROTOR Final Report
Alvin N. Hammer, G. G. Aigret, T. P. Psichogios, and C. Rodgers

Jun. 1986 258 p
(Contract NAS3-22513; DA Proj. 1L1-612209-AH-76)
(NASA-CR-179503; NAS 1.26:179503; SR86-R-4938-39) Avail: NTIS HC A12/MF A01 CSCL 21E

A design and fabrication program was conducted to evaluate a unique concept for constructing a cooled, high temperature radial turbine rotor. This concept, called split blade fabrication was developed as an alternative to internal ceramic coring. In this technique, the internal cooling cavity is created without flow dividers or any other detail by a solid (and therefore stronger) ceramic plate which can be more firmly anchored within the casting shell mold than can conventional detailed ceramic cores. Casting is conducted in the conventional manner, except that the finished product, instead of having finished internal cooling passages, is now a split blade. The internal details of the blade are created separately together with a carrier sheet. The inserts are superalloy. Both are produced by essentially the same software such that they are a net fit. The carrier assemblies are loaded into the split blade and the edges sealed by welding. The entire wheel is Hot Isostatic Pressed (HIPed), braze bonding the internal details to the inside of the blades. During this program, two wheels were successfully produced by the split blade fabrication technique.

COMPOUND CYCLE ENGINE PROGRAM
G. A. Bobula, W. T. Wintucky, and J. G. Castor (Garrett Turbine Engine Co., Phoenix, Ariz.) 1986 23 p Presented at the Rotary Wing Propulsion System Specialist Meeting, Williamsburg, Va., 12-14 Nov. 1986; sponsored by the American Helicopter Society
(DA Proj. 1L1-62209-AH-76)
(NASA-TM-88879; E-3286; NAS 1.26:88879;
USAAVSCOM-TR-86-C-37) Avail: NTIS HC A02/MF A01 CSCL 21E

The Compound Cycle Engine (CCE) is a highly turbocharged, power compounded power plant which combines the lightweight pressure rise capability of a gas turbine with the high efficiency of a diesel. When optimized for a rotorcraft, the CCE will reduce fuel burned for a typical 2 hr (plus 30 min reserve) mission by 30 to 40 percent when compared to a conventional advanced technology gas turbine. The CCE can provide a 50 percent increase in range-payload product on this mission. A program to establish the technology base for a Compound Cycle Engine is presented. The goal of this program is to research and develop those technologies which are barriers to demonstrating a multicylinder diesel core in the early 1990's. The major activity underway is a three-phased contract with the Garrett Turbine Engine Company to perform: (1) a light helicopter feasibility study, (2) component technology development, and (3) lubricant and material research and development. Other related activities are also presented. Author

PRESSURE AND FLOW FIELD MEASUREMENTS OF AXIAL TURBINE TIP CLEARANCE FLOW IN A LINEAR CASCADE
J. P. Bindon 1986 72 p
(CUED/A-Turbo-TR-123; ISSN-0309-6521) Avail: NTIS HC A04/MF A01

The fluid flow in the tip clearance region of 2D turbine cascade was examined with special reference to unknown factors which cause high heat transfer rates and burnout along the edge of the pressure surface at the tips of unshrouded cooled axial turbine blades. Using a special micro tapping technique, the pressure along a very narrow strip of the pressure surface edge was found to be lower than the cascade outlet pressure by a factor of 2.8. This low pressure, coupled with a boundary layer measured as being extremely thin due to the intense acceleration at gap entry, is believed to cause the high heat transfer rates and to result from tip clearance flow phenomena the existence of which have not been previously realized. The ultra low pressure is primarily caused by the sharp flow curvature demanded of the leakage flow moving up the pressure surface and turning through 90 at gap entry. A low pressure region in the suction corner formed by the mainstream flow moving round the leakage and secondary vortices which creates an added pressure differential to drive the clearance flow; the formation of a separation bubble the blockage from which forms a throat near the pressure surface and hence induces the lowest pressure there; and the apparent attachment of the flow around the corner over the critical zone instead of separation are also discussed.

INVESTIGATION OF COATING PERFORMANCE AND CORROSION OF COMPRESSOR COMPONENTS IN THE TF30-P-3 ENGINE OF F111C AIRCRAFT
L. V. Wake and B. S. Smith Jan. 1986 32 p
(AD-A168802; MRL-R-984) Avail: NTIS HC A03/MF A01 CSCL 11/3

This report examines factors involved in the degradation of the protective coating, Chromalloy S-A12, employed on the low pressure compressor stators in the Pratt and Whitney TF30-P-3 engine of an RAAF F111 aircraft. The study is confined to the 7th stage of the engine (4th stage; low pressure compressor). The stator examined had experienced considerable corrosion after only 427 hours operation. Stators on other engines are failing for similar reasons. Small corrosion nodules were present on specific areas of each stator vane coating. Sections on the outer ring or shroud were found to be corroded along a geometric arc around the 6 o'clock position of the stage. These included: (1) both surfaces of the outer shroud or ring (2) the air seal around the shroud and (3) the area underneath the air path seal or rub strip. The corrosion nodules on the vanes were associated with discontinuities in the coating. These discontinuities resulted in breakdown of the diffusion coating in surrounding areas forming aluminium, chromium and iron oxides. The elements sulphur and chlorine and to a lesser extent calcium and potassium were also found in the corrosion deposits. These elements are present in the local water supply and a detergent used for aircraft washing. Examination of the compressor washing and drying procedures are recommended.

CONTROL OF GAS TURBINES. THE FUTURE: IS A RADICAL APPROACH NEEDED?
P. H. Riley 12 Feb. 1986 26 p
(PNR-90295; ETN-86-98014) Avail: NTIS HC A03/MF A01

An engine control system which considers systems as well as individual component changes is supported. It is argued that by moving devices which dissipate a large amount of power away from the electronic engine control (EEC) box, inflight shutdown rate due to overheating can be reduced. The EEC reliability per actuator can be improved by changing to an on/off rather than a variable current transducer.

THEORETICAL AND EXPERIMENTAL INVESTIGATIONS OF SENSOR LOCATION FOR OPTIMAL AEROELASTIC SYSTEM STATE ESTIMATION Ph.D. Thesis
Gang Liu 1986 184 p
Avail: Univ. Microfilms Order No. DA8608180

One of the major concerns in the design of an active control system is obtaining the information needed for effective feedback. This involves the combination of sensing and estimation. A sensor location index is defined as the weighted sum of the mean square estimation error in which the sensor locations can be regarded as estimator design parameters. The design goal is to choose these locations to minimize the sensor location index. The gradient of the sensor location index with respect to each individual sensor location is formulated and a program using this gradient for systematic optimal sensor location search is developed. The choice of the number of sensors is a tradeoff between the estimation quality based on the same performance index and the total costs of installing and maintaining extra sensors. An experimental study for choosing the sensor location is conducted on an aeroelastic system. It is the physical realization of a two degree of freedom typical section wing. It consists of a NACA 0015 typical section wing with six accelerometers installed inside along the wing chord as the estimator measuring instruments, an existing wind tunnel section, and some other accompanying experimental devices. The system modeling which includes the unsteady aerodynamics model developed by Stephen Rock has been improved. The center of percussion of the rigid two degree of freedom typical section wing has been verified as a sensor location for which the system is unobservable. Experimental results verify the trend of the theoretical predictions of the sensor location index for different sensor locations at various wind speeds. Dissert. Abstr.

(NASA-CR-172439; NAS 1.26:172439; NOR-84-158) Avail: NTIS HC A16/MF A01 CSCL 01C

A comprehensive low-speed wind tunnel investigation was performed of leading edge vortex flaps applied to representative aircraft configurations. A determination was made of the effects of analytically- and empirically-designed vortex flaps on the static longitudinal and lateral-directional aerodynamics, stability, and control characteristics of fighter wings having leading-edge swee angles of 45 to 76.5 degrees. The sensitivity to several configuratio modifications was assessed, which included the effects of fla planform, leading- and trailing-edge flap deflection angles, win location on the fuselage, forebody strakes, canards, and centerlin and outboard vertical tails. Six-component forces and moment wing surface static pressure distributions, and surface flow pattern were obtained using the Northrop 21- by 30-inch low-speed win tunnel. Autho

AIRCRAFT AUTOMATIC-FLIGHT-CONTROL SYSTEM WITH INVERSION OF THE MODEL IN THE FEED-FORWARD PATH USING A NEWTON-RAPHSON TECHNIQUE FOR THE INVERSION
G. Allen Smith, George Meyer, and Maurice Nordstrom (Sterling Software, Palo Alto, Calif.) Jul. 1986 96 p
(NASA-TM-88209; A-2-86092; NAS 1.15:88209) Avail: NTIS HC A05/MF A01 CSCL 01C

A new automatic flight control system concept suitable fo aircraft with highly nonlinear aerodynamic and propulsion characteristics and which must operate over a wide flight envelope was investigated. This exact model follower inverts a complete nonlinea model of the aircraft as part of the feed-forward path. The inversion is accomplished by a Newton-Raphson trim of the model at each digital computer cycle time of 0.05 seconds. The combination of the inverse model and the actual aircraft in the feed-forward path alloys the translational and rotational regulators in the feedback path to be easily designed by linear methods. An explanation of the model inversion procedure is presented. An extensive set of simulation data for essentially the full flight envelope for a vertical attitude takeoff and landing aircraft (VATOL) is presented. These data demonstrate the successful, smooth, and precise control that can be achieved with this concept. The trajectory includes conventional flight from 200 to 900 ft/sec with path accelerations and decelerations, altitude changes of over 6000 ft and 2g and 3g turns. Vertical attitude maneuvering as a tail sitter along all axes is demonstrated. A transition trajectory from 200 ft/sec in conventional flight to stationary hover in the vertical attitude includes satisfactory operation through lift-cure slope reversal as attitude goes from horizontal to vertical at constant altitude. A vertical attitude takeoff from stationary hover to conventional flight is also demonstrated. Author

FLIGHT TEST REPORT OF THE NASA ICING RESEARCH AIRPLANE: PERFORMANCE, STABILITY, AND CONTROL AFTER FLIGHT THROUGH NATURAL ICING CONDITIONS Final Report
Jerry L. Jordan, Stewart J. Platz, and William C. Schinstock Oct. 1986 159 p
(Contract NAS3-24547)
(NASA-CR-179515; NAS 1.26:179515; KSR-86-01) Avail: NTIS HC A08/MF A01 CSCL 01C

Flight test results are presented documenting the effect of airframe icing on performance and stability and control of a NASA DHC-6 icing research aircraft. Kohlman System Research, Inc., provided the data acquisition system and data analysis under contract to NASA. Performance modeling methods and MMLE techniques were used to determine the effects of natural ice on the aircraft. Results showed that ice had a significant effect on the drag coefficient of the aircraft and a modest effect on the MMLE derived longitudinal stability coefficients (code version MMLE). Data is also presented on asymmetric power sign slip maneuvers showing rudder floating characteristics with and without ice on the vertical stabilizer. Author

Airports for light aircraft must often be built in areas where base course material is inadequate or economically unavailable. Sand grids may provide an economical solution in these cases. Previous work with sand grids has identified optimum grid-cell geometry based on ultimate bearing capacity. Past observations also suggest the nature of sand-grid behavior for small stresses and strains. From these a model was formulated for analyzing the performance of sand grids in pavement systems and spot-checked using field data from a full-scale, accelerated-traffic sand-grid test section. METHODS FOR ASSESSING WALL INTERFERENCE IN THE 2-BY 2-FOOT ADAPTIVE-WALL WIND TUNNEL
Edward T. Shairer Jun. 1986 61 p
(NASA-TM-88252; A-86249; NAS 1.15:88252) Avail: NTIS HC A04/MF A01 CSCL 14B

Discussed are two methods for assessing two-dimensional wall interference in the adaptive-wall test section of the NASA Ames 2 x 2-Foot Transonic Wind Tunnel: (1) a method for predicting free-air conditions near the walls of the test section (adaptive-wall methods); and (2) a method for estimating wall-induced velocities near the model (correction methods), both of which methods are based on measurements of either one or two components of flow velocity near the walls of the test section. Each method is demonstrated using simulated wind tunnel data and is compared with other methods of the same type. The two-component adaptive-wall and correction methods were found to be preferable to the corresponding one-component methods because: (1) they are more sensitive to, and give a more complete description of, wall interference; (2) they require measurements at fewer locations; (3) they can be used to establish free-stream conditions; and (4) they are independent of a description of the model and constants of integration. A DESCRIPTION OF THE ACTIVE AND PASSIVE SIDEWALL-BOUNDARY-LAYER REMOVAL SYSTEMS OF THE 0.3-METER TRANSONIC CRYOGENIC TUNNEL
Charles B. Johnson, A. V. Murthy, and Edward J. Ray Nov. 1986 21 p
(NASA-TM-87764; L-16178; NAS 1.15:87764) Avail: NTIS HC A02/MF A01 CSCL 14B

Results are presented for an operational checkout and shakedown of the active sidewall-boundary-layer removal system newly installed in the Langley 0.3-meter Transonic Cryogenic Tunnel (0.3-m TCT). Prior to the installation of this active removal system, the sidewall-boundary layer was removed passively by exhausting directly to the atmosphere (i.e., no reinjection). With the active removal system using the reinjection compressor, the removal capability is greatly expanded to cover the entire operating envelope of the 0.3-m TCT. Details of the active removal system are presented including the compressor reinjection circuit, the compressor pressure ratio/surge control, and the compressor recirculation loop. The control logic and features of the compressor surge control are explained. Initial tests covering critical operating conditions show mass flow removal rates of about 5 percent at lower Mach numbers can be obtained with the active system. Measured performance characteristics of the compressor are presented. As part of the validation of the active system, limited airfoil tests were made using the new system. Author

MOTION CHARACTERISTICS OF THE UTIAS FLIGHT RESEARCH SIMULATOR MOTION-BASE
Peter Robert Grant Jul. 1986 144 p Sponsored in part by Natural Sciences and Engineering Research Council, and by University of Toronto
(UTIAS-TN-261; ISSN-0082-5263) Avail: NTIS HC A07/MF A01

The motion characteristics of the UTIAS Flight Research Simulator Motion-Base were experimentally determined. More specifically describing function tests (under various operating conditions), 1/2 Hz noise level tests, signal-to-noise tests, and hysteresis tests were performed for all six degrees-of-freedom. Dynamic threshold tests were performed for the heave degree-of-freedom. The motion-base was found to have a reasonably flat amplitude response up to 10 Hz in all degrees-of-freedom. Motion in the non-dirven degrees-of-freedom was small compared to the driven channel. The noise of the motion-base was found to be the sum of braodband background noise and harmonics of the driven frequency, with the amplitude of the noise varying with

both the amplitude and frequency of the driving signal. Hysteresis was determined to be neglible. The dynamic threshold was found to be small and quite acceptable for most projected applications involving the motion-base. Author

THE 8 m X 6 m LOW SPEED WIND TUNNEL AT THE CHINESE AERODYNAMIC RESEARCH AND DEVELOPMENT CENTER
Maoxum Wang and Ruikang Pan 30 May 1986 14 p Transl. into ENGLISH from Guoji Hangkong (China), no. 10(260), Oct. 1984 p 2-4
(AD-A168448; FTD-ID(RS)T-0257-86) Avail: NTIS HC A02/MF A01 CSCL 14/2

The low speed wind tunnel at CARDC is a large scale, double experimental section wind tunnel solely designed and built in China. It is primarily used for experiments in the aerodynamic characteristics of aerospace vehicles, i.e., ground wind load of guided missiles and space vehicles; large attack angle of airplanes and guided missiles; large prototypes; aerodynamics of helicopters and vertical short takeoff aircraft; and industrial aerodynamics (e.g., architecture, bridges, fans and automobiles). It passed national certification at the end of 1983 and was officially released for use. This wind tunnel is an open-circuit, closed double experimental section in series, large scale low speed wind tunnel. Its length is 237 m with a maximum width of 40 m and a maximum height of 20.5 m. It consists of air intake assembly, stabilization section, first convergence section, first experimental section, second experimental section, fan section, second divergence section, and air exhaust assembly. DESIGN OF A CONTROL SYSTEM FOR A CRYOGENIC WIND TUNNEL OPTIMIZING A VECTOR PERFORMANCE INDEX
Reinhold Steinhauser Feb. 1986 208 p Transl. into ENGLISH from "Reglerentwurf fuer einen Tieftemperatur-Windkanal mittels Guetevektoroptimierung" (Oberpfaffenhofen, West Germany) Original language document was announced at N86-15329
(ESA-TT-965; DFVLR-FB-85-37; ETN-86-98247) Avail: NTIS HC A10/MF A01; original German version avail. at DFVLR, Cologne, West Germany DM 56

A cryogenic wind tunnel was transformed to reach higher Reynolds numbers using a controller design. The problem of a controller design for a nonlinear multivariable dead time system was solved by linearization, model decomposition, discretization and order reduction to obtain an efficient design algorithm based on pole assignment and performance vector optimization. The controller design behavior on a nonlinear model before and after performance vector optimization was studied. The optimized controller can be applied in a real wind tunnel. The reduced static pressure deviation due to performance vector optimization leads to reduced control costs for suction and injection of gaseous nitrogen. Further development of the control system design equipment as well as the development of a graphic interactive algorithm for the design procedure is recommended. ESA

NUMBER AND DURATION OF RUNWAY VISUAL RANGE (RVR) RUNS FOR RVR-VALUES LOWER THAN 225 m
A. H. C. Stalenhoef 1986 25 p In DUTCH; ENGLISH summary
(KNMI-TR-85(FM); ISSN-0169-1708; ETN-86-98500) Avail: NTIS HC A02/MF A01

The number and length of runway visual range (RVR) runs for values of the RVR leass than 225 m were studied in order to obtain a better insight into the appearance of dense fog at Amsterdam airport Schiphol. The study was based on 1 m data of transmissometers and matching background luminance meters at several locations in the airport for the period June 1979 till May 1985. The percentage of time during each month that the transmissometer data were not available on magnetic tape, the number of runs of specified lengths for each location, the local number of runs in the period, the relative frequencies of runs with several lengths for each location, and information about the to duration that the RVR does not exceed a certain level are tabulat An expression for the probability distribution of the duration th dense fog may persist was derived. NASA SELECTS INVESTIGATIONS FOR COMET RENDEZVOU MISSION
Leon Perry 20 Oct. 1986 7 p
(NASA-TM-89261; NASA-News-Release-86-150; P86-10218; NA 1.15:89261) Avail: NASA Scientific and Technical Informatic Facility, P.O. Box 8757, BWI Airport, Md. 21240 CSCL 22A

Thirty-eight possible investigations were selected for the Com Rendezvous Asteroid Flyby (CRAF) mission planned for launch the early 1990s. The mission is designed to send an unmanne U.S. spacecraft to rendezvous with a comet, fly in formation wi it for three years and fire an instrumented penetrator into th comet nucleus. The spacecraft will make close flybys of tw asteroids on its way to the comet encounter. The CRAF missio will conduct a detailed study of the composition and physic properties of the comet nucleus and will observe changes th occur as the comet approaches the Sun. Other mission objec tives include analysis of the gas, dust, and plasma comprising th comet atmosphere and meaurement of the size, shape, an surface properties of the asteroids. The CRAF spacecraft will car 11 to 14 instruments including cameras, dust analyzers, and nucleus penetrator. Results from a 2-year instrument accommoda tion study will determine the final payload composition. B.G

SDI (STRATEGIC DEFENSE INITIATIVE) PROGRAM: EVALUATION OF DOE'S (DEPARTMENT OF ENERGY'S) ANSWERS TO QUESTIONS ON X-RAY LASER EXPERIMENT, BRIEFING REPORT
Jun. 1986 13 p
(PB86-209236; GAO/NSIAD-86-140BR; B-223094) Avail: NTIS HC A02/MF A01 CSCL 15C

The briefing report responds to a request that GAO review the Department of Energy's (DOE's) answers to a series of questions raised about the X-ray laser program which DOE is conducting for the Department of Defense's (DOD's) Strategic Defense Initiative Organization (SDIO). Many of these questions resulted from press reports, especially a November 12, 1985, Los Angeles Times article. Essentially, GAO found the X-ray laser program is a research program with many unsolved issues. In their opinion, there was no design flaw in diagnostic instrumentation as mentioned in the Los Angeles Times article. However, analysis of test data by Lawrence Livermore National Laboratory (LLNL) scientists raised questions about the accuracy of some

experimental data. As a result, some diagnostic equipment was reconfigured. These unexpected measurement uncertainties are now much better understood. In the GAO's opinion, there was no need to delay the latest X-ray laser nuclear test. GRA

TASS REPORTS VEGAS-1 ENCOUNTER WITH HALLEY'S COMET c90
In its USSR Report: Space (JPRS-USP-86-005) 12 Sep. 1986 p 112 113 Transl. into ENGLISH from Leningradskaya Pravda (Leiningrad, USSR), 7 Mar. 1986 p 11 (For primary document see N87-11809 03-12)
Avail: NTIS HC A11/MF A01

The Soviet automatic station Vega-1, whose flight is taking place within the framework of the multipurpose international project Venera-kometa Galleya, has successfully performed its program of research of Halley's Comet. On March 6, 1986, the Vega-1 station passed through the comet's gas and dust shell at a distance of about 9,000 kilometers from its nucleus and performed comprehensive scientific studies of this heavenly body for the first time. With the aid of apparatus developed jointly by scientists and specialists of the USSR, Austria, Bulgaria, the German Democratic Republic, Poland, France, the Federal Republic of Germany, and Czechoslovakia, large-scale pictures of the comet nucleus were obtained, and measurements were made of the temperature and other physical chemistry characteristics of the comet. The chemical composition of gas and dust component substances of the comet were analyzed, and studies were made of the electromagnetic fields around the comet and of physical processes taking place in its shell. B.G.

BALLOON PROBE AND DESCENT APPARATUS EXPLORATION OF VENUS DISCUSSED c91
Yuriy Zaytsev *In its* USSR Report: Space (JPRS-USP-86-005) 12 Sep. 1986 p 125 131 Transl. into ENGLISH from Nauka i Tekhnika (Riga, USSR), no. 10, Oct. 1985 p 5-6 (For primary document see N87-11809 03-12)
Avail: NTIS HC A11/MF A01

The automated interplanetary space stations Vega-1 and Vega-2 launched in December, 1984 toward Halley's Comet, have completed the first stage in their planned flight program research on the planet Venus. The fly-by of Venus on the way to Halley's Comet allowed the use of one spacecraft for solving three problems. The first problem was the fundamentally new experiments in studying the circulation of the Venusian atmosphere and its meteorological parameters using a floating balloon probe. The second problem was research on the atmosphere, cloud layer and planetary surface using a descent apparatus. And, finally, the third problem was an investigation of Halley's comet from a fly-by trajectory. A full interpretation of all the data obtained using spectrometers will take several years, since the volume of material is great and a nonstandard solution must be sought for the analysis of the new information. ANALYTICAL INVESTIGATION OF THE DYNAMICS OF TETHERED CONSTELLATIONS IN EARTH ORBIT, PHASE 2 Quarterly Report, 22 Jun. - 21 Sep. 1986
Enrico C. Lorenzini, David A. Arnold, Mario Cosmo, and Mario D. Grossi Oct. 1986 59 p
(Contract NAS8-36606)
(NASA-CR-178953; NAS 1.26:178953; QR-6) Avail: NTIS HC A04/MF A01 CSCL 22A

The following topics related to the dynamics of the 4-mass tethered system are addressed: (1) the development of damping algorithms for damping the out-of-plane libration of the system and the interaction of the out-of-plane control with the other degrees of freedom; and (2) the development of environmental models to be added to the dynamics simulation computer code. The environmental models are specifically a new drag routine based on the Jacchia's 1977 model, a J(2) model and an accurate thermal model of the wire. Regarding topic (1) a survey of various out-of-plane libration control laws was carried out. Consequently a yo-yo control law with amplitude of the tether length variation proportional to the amplitude of the out-of-game libration has been selected. This control law provides good damping when applied to a (theoretical) two-dimensional system. In the actual 3-dimensional 4-mass tethered system, however, energy is transferred to the least damped degrees of freedom (the out-of-plane lateral deflections are still undamped in the present simulations) in such a way as to decrease the effectiveness of the algorithm for out-of-plane libration control. The addition of damping algorithms for the out-of-plane lateral deflections is therefore necessary. M.G.

GEOSTATIONARY ORBITAL ESTIMATION USING A KALMAN

FILTER
G. B. Sincarsin Aug. 1986 70 p Sponsored by DSS
(UTIAS-242; ISSN-0082-5263) Avail: NTIS HC A04/MF A01

The ability of a sequential Kalman filter to predict a geostationary and an approximately geostationary orbit is assessed by comparison with the corresponding orbits predicted by a least-squares batch estimator. Prior to performing this comparison, the perturbation models and observations assumed in each estimator are compared and shown to be essentially the same (except for atmospheric drag). An analytical expression for the state noise matrix, assuming a geostationary reference orbit, is given and used during numerical studies. Numerical results indicate that the Kalman filter performs well for the case of a geostationary orbit. For an approximately geostatinary orbit the performance of the Kalman filter degrades to the point of neutral stability. A parameter study, in which the values of the initial error covariance matrix, the measurement nosie matrix, and the state noise matrix are individually varied, is conducted to assess the sensitivity of the Kalman filter performance. It is concluded that to improve the Kalman filter performance, it is the analytical forms assumed for the error and noise matrices, and not the values normally assigned to these matrices, that deserves further study. FAST OPTIMAL ORBIT ESTIMATION FROM GPS MEASUREMENTS
Roberto V. F. Lopes and Helio Koiti Kuga Oct. 1986 38 p
(INPE-4016-NTE/263) Avail: NTIS HC A03/MF A01

This report presents an optimal solution to the problem of local orbit estimation of an Earth satellite from observations of range and range-rate provided by n greater than or equal to 3 distinct stations. The procedure is especially suitable for processing measurements generated by the Global Positioning System (GPS). In addition to the position and velocity vectors estimation, the error covariance matrices of the estimates are obtained. Preliminary results indicate that the algorithm developed, named ORBEST, is a promising tool for precision real orbit estimation. Author

M. L. Hodgdon, C. M. Fowler, and C. G. Homan 1986 8 p Presented at the 4th International Conference on Megagauss Magnetic-Field Generation and Related Topics, Santa Fe, N. Mex., 14 Jul. 1986 Prepared in cooperation with Watervliet Arsenal
(Contract W-7405-eng-36)
(DE86-012424; LA-UR-86-2267; CONF-860703-6) Avail: NTIS HC A02/MF A01

Approximate solutions for the equation of motion of a projectile in an augmented rail gun are presented. These solutions show that the resistance in the rail gun system plays a role similar to the resistance in an R-C-L circuit. For small values of resistance, the projectile exhibits a slightly damped oscillatory motion, and there is a value of resistance for which the oscillations disappear and the motion appears critically damped. The dependence of the oscillations on the projectile mass and the augmenting field are also discussed. DOE

STATE-SPACE ANALYSIS OF THE TRIDENT 2 MARK 6 GYRO M.S. Thesis
David L. Krueger Mar. 1986 70 p
(AD-A168404) Avail: NTIS HC A04/MF A01 CSCL 17/7

This thesis conducts a state-space analysis of the Mark 6 gyro used in the Trident 2 missile system. Optimal control techniques, utilizing a region controller, have been employed in designing a gyro controller. The response of the system to missile motion is examined and compared to the system response using the current control laws. It is shown that an optimal region controller reduces the gyro error in the system while effectively avoiding gimbal lock, a situation which exists when gyro orientation prevents missile motion from being isolated in an orthogonal three axis coordinate system. Recommendations for the application of additional modern control techniques are included. Author (GRA)

PROPOSAL FOR REACHING AN OPTIMIZATION OF A SOLID COMBUSTION VEHICLE SATELLITE LAUNCHER AND ITS TRAJECTORY M.S. Thesis [PROPOSTA DE ABORDAGEM PARA A OTIMIZACAO DE UM VEICULO LANCADOR DE SATELITES A COMBUSTIVEL SOLIDO DE SUA TRAJETORIA]
Carlos Odwaldo Bueno Neto Aug. 1986 136 p In PORTUGUESE; ENGLISH summary
(INPE-3968-TDL/232) Avail: NTIS HC A07/MF A01

The simultaneous optimization of mass distribution and of the trajectory of a Satellite Launcher is proposed in order to maximize the payload mass for a specified orbit. The optimization problem is formulated establishing the performance index, dynamic constraints, and terminal constraints. The inequality constraints are included in the dynamic constraints by new state variables, and new terminal constraints. The proposed iteractive solution gives the final state variation as a function of parameters variation about nominal trajectory and suboptimal controls, in each iteraction. The solution is formulated using a gradient type direct search procedure where the parameter variations are linearly estimated through two components: one is the a priori information on the gradient direction, and the other towards terminal constraints satisfaction. CONTINUOUS PREDICTION OF SPARTAN VISIBILITY FROM ORBITER OVER MODELED FREE-FLIGHT MISSION
Joseph C. King Jan. 1985 21 p
(NASA-TM-86242; NAS 1.15:86242) Avail: NTIS HC A02/MF A01 CSCL 09F

Orbital operations in the neighborhood of other satellites or free-flying objects need the ability to see and detect such objects optically. This ability depends primarily on the brightness of the object relative to other sources present. The present analysis and computational procedure provides a means for predicting the visual brightness of a satellite when viewed from a nearby satellite in the same orbit. It is designed specifically for estimating the brightness of Spartan free-flyers from the STS Orbiters which release and later retrieve them, but the basic methods are applicable to other satellite-to-satellite visibility prediction problems. The Spartan reflector model defined herein is illuminated both by direct solar radiation and by the earth (albedo), producing a model source of defined directional intensity. The intensity in the Orbiter direction (along orbit) yields the desired maximum range directly. The required geometric and photometric calculations involve a number of angles in space, which are readily computed from the basic directions defining their sides. The time-dependent directions are determined by straightforward calculation from fundamental relationships and constants. Author

TELEMETRY STANDARDS
May 1986 135 p Supersedes IRIG-STANDARD-106-80 (AD-A168818; IRIG-STANDARD-106-86; IRIG-STANDARD-106-80) Avail: NTIS HC A07/MF A01 CSCL 09/6

The Telemetry Group (TG) of the Range Commanders Council (RCC) has prepared this document to foster the compatibility of telemetry transmitting, receiving, and signal processing equipment at all of the Test and Evaluation (T&E) ranges under the cognizance of the RCC. The Range Commanders highly recommend that telemetry equipment operated at the T&E ranges and telemetry equipment used by the range personnel in programs that require test range support, conform to these standards. These standards do not necessarily define the existing capability of any test range, but constitute a guide for the orderly implementation and application of telemetry systems for both the ranges and range users. The scope of capabilities attainable with the utilization of these standards requires a careful consideration of trade-offs. Guidance concerning these trade-offs is provided in the text. These standards provide the necessary criteria on which to base equipment design and modification. The ultimate purpose is to ensure an efficient spectrum and an interference-free operation of the radio link for telemetry systems at the RCC member ranges. etry systems at the RCC member ranges. DESIGN, CONSTRUCTION AND UTILIZATION OF A SPACE STATION ASSEMBLED FROM 5-METER ERECTABLE STRUTS
Martin M. Mikulas, Jr. and Harold G. Bush Oct. 1986 40 p
(NASA-TM-89043; NAS 1.15:89043) Avail: NTIS HC A03/MF A01 CSCL 22B

Presented are the primary characteristics of the 5-meter erectable truss designated for the space station. The relatively large 5-meter truss dimension was chosen to provide a deep beam for high bending stiffness yet provide convenient mounting locations for space shuttle cargo bay size payloads which are 14.5 ft. (4.4 m) in diameter. Truss nodes and quick-attachment erectable joints are described which provide for evolutionary three-dimensional growth and for simple maintenance and repair. A mobile remote manipulator system is described which is provided to assist in station construction and maintenance. A discussion is also presented of the construction of the space station and the associated EVA time. Author

CONCEPTUAL DESIGN OF A SYNOPTIC INTERPLANETARY MONITOR PLATFORM AT L SUB 1 (SIMPL) Final Report, 16 Aug. - 30 Nov. 1985

Nov. 1985 193 p Supersedes JHU/APL/SDO-7599
(Contracts MIPR-FY-71-2185000-21; AF Proj. 2311)
(AD-A168522; JHU/APL/SDO-7805; AFGL-TR-85-0310; JHU/APL/SDO-7599) Avail: NTIS HC A09/MF A01 CSCL 03/2

A conceptual design and feasibility study is described for a Synoptic Interplanetary Monitor Platform (SIMPL) to be located at the Earth-Sun interior libration point (L sub 1), about one million miles from Earth. There, SIMPL's magnetometer, solar wind plasma instrument, particle instrument, and radio wave instrument will obtain data to provide the U. S. Air Force Air Weather Service with early warnings of solar-induced disruptions of the terrestrial environment. The data will be processed on-board into militarily useful forecast parameters and transmitted in real-time 24 hours/day to AWS stations worldwide. GRA

QUALITATIVE RESULTS FOR DISTRIBUTED SYSTEMS WITH DISCRETE AND STIFFNESS WITH APPLICATION TO CONTROL Final Report, 1 Jul. 1982 - 30 Jun. 1985
Daniel J. Inman 26 Aug. 1985 215 p
(Grant AF-AFOSR-0242-82)
(AD-A168622; AFOSR-86-0286TR) Avail: NTIS HC A10/MF A01 CSCL 22/2

Distributed parameter models of large flexible space structures subject to various control techniques have been studied. The main thrust has been to develop qualitative results which are independent of truncation of discretization approaches by treating the fully distributed model. Emphasis has been on controlling the transient response of non-conservative linear partial differential equation models of such structures subject to a few point actuators. Inequalities have been developed between the stiffness and damping operators which when satisfied guarantee that the response of a self-adjoint system will be uniformly exponentially stable. In addition, it has been shown that the inequalities insure that finite dimensional versions of the control problem converge to an optimal control of the fully distributed system subject to compact feedback as the number of modes in the finite model increases. The inequality developed constitutes a generalization of the concept of underdamping normally used with single degree of freedom systems and provides a physical interpretation of the result. GRA

(DE86-009726; UCRL-93802-Rev-1; CONF-8511201-1-Rev-1) Avail: NTIS HC A02/MF A01

Satellite component hardening requirements in the early 1970's led to the development of the enhanced energy sharing concept (EESC) for optical mirror coatings. The idea was to increase survivability of aluminum coated fused silica mirrors to pro energy deposition by interposing a thick layer of beryllium betw the aluminum and the substrate. Separating the materials of hig Z by the low Z beryllium redistributes the deposited heat i over a larger volume and reduces the maximum temperature the aluminum film. Theoretical analyses of heat transfer du and after an energy input pulse supported this concept subsequent above-ground and underground tests confirmed greater survivability of this mirror design. In the sections that fol we give an insight into the physical mechanisms responsible nuclear radiation deposition and temperature rise. This is follow by a review of calculations of melt fluence for several mi constructions taking into account only the dominant deposit mechanisms and heat flow. D

REPORT ON THE DISMANTLING AND EXAMINATION OF DORNIER SYSTEM GmbH MEDIUM SPEED MECHANISM ON COMPLETION OF A SEVEN YEAR REAL-LIFE TEST

J. A. Duvall Paris ESA Sep. 1985 31 p
(Contract ESA-2584/84)
(ESA-ESTL-65; ESA-CR(P)-2231; ETN-86-98112) Avail: NTIS HC A03/MF A01

A medium speed satellite antenna/platform despin mechanism was examined after it satisfactorily completed a 7 yr real life thermal vacuum test. The mechanism components are in excellent condition. The oil-lubricated bearings are virtually as new without any measurable wear. The oil and grease lubrication is highly satisfactory although oil was lost from the bearings due to the inadequate application of anticreep coating. This oil marginally contaminated the power brush/slip ring components but without any adverse consequences. The wear rate of the brush/slip ring components is relatively low but the 20 brush elements generated 3.0 cc of loose debris which liberally coated all surfaces within the brush/slip ring module. SPACE-BASED LASER-DRIVEN MHD GENERATOR: FEASIBILITY STUDY Final Report
S. H. Choi Oct. 1986 52 p
(NASA Order L-28161B)
(NASA-CR-178184; NAS 1.26:178184; Rept-651104) Avail: NTIS HC A04/MF A01 CSCL 10C

The feasibility of a laser-driven MHD generator, as a candidate receiver for a space-based laser power transmission system, was investigated. On the basis of reasonable parameters obtained in the literature, a model of the laser-driven MHD generator was developed with the assumptions of a steady, turbulent, two-dimensional flow. These assumptions were based on the continuous and steady generation of plasmas by the exposure of the continuous wave laser beam thus inducing a steady back pressure that enables the medium to flow steadily. The model considered here took the turbulent nature of plasmas into account in the two-dimensional geometry of the generator. For these conditions with the plasma parameters defining the thermal conductivity, viscosity, electrical conductivity for the plasma flow, a generator efficiency of 53.3% was calculated. If turbulent effects and nonequilibrium ionization are taken into account, the efficiency is 43.2%. The study shows that the laser-driven MHD system has potential as a laser power receiver for space applications because of its high energy conversion efficiency, high energy density and relatively simple mechanism as compared to other energy conversion cycles. EFFECT OF HARD PARTICLE IMPACTS ON THE ATOMIC OXYGEN SURVIVABILITY OF REFLECTOR SURFACES WITH TRANSPARENT PROTECTIVE OVERCOATS
Daniel A. Gulino 1986 22 p Proposed for presentation at the 25th Aerospace Sciences Meeting, Reno, Nev. 12-15 Jan. 1987; sponsored by the American Institute of Aeronautics and Astronautics
(NASA-TM-88874; E-3281; NAS 1.15:88874) Avail: NTIS HC A02/MF A01 CSCL 10B

Silver mirror samples with protective coatings were subjected to a stream of 27 microns alumina particles to induce pinhole defects. The protective coating consisted of a layer of aluminum dioxide over silver followed by a layer of silicon dioxide over the alumina. Samples were prepared on both graphite-epoxy composite and fused quartz substrates. After exposure to the hard particle stream, the samples were exposed to an oxygen plasma environment in a laboratory plasma asher. The effects of both the hard particles and the oxygen plasma were documented by both reflectance measurements and scanning electron microscopy. The results indicated that oxidative damage to the silver reflecting layer continues beyond that of the erosively exposed silver. Oxidative

undercutting of the silver layer and graphite-epoxy substrate continues in undamaged areas through adjacent, particle damaged defect sites. This may have implications for the use of such mirrors in a space station solar dynamic power system. Author

ELECTRO-OPTICAL CONTROL OF SOLID FUEL ROCKET BURN RATE Patent
Peter C. Winch and Mick Blackledge, inventors (to Air Force) Issued 13 May 1986 9 p
(AD-D012397; US-Patent-4,587,805; US-Patent-Appl-SN-696298; US-Patent-Class-60-234) Avail: US Patent and Trademark Office CSCL 21/8

This invention pertains to a solid fuel rocket burn rate control apparatus wherein grain preheating energy is supplied to the grain region just ahead of the regressing burn face by optical conductors such as fiber optic filaments that are buried in the grain and dispersed across the grain cross section. The optical conductors receive optical energy from one of several types of electrical-to-optical energy transducers such as a semiconductor laser or an incandescent source; the optical conductors promote coning burn action at the burn face of the rocket and allow control of the burn rate by electrically modified optical signals. SIZE DISTRIBUTION OF UNBURNED ALUMINUM PARTICLES IN SOLID PROPELLANT ROCKET MOTOR EXHAUST
R. S. Larson Jun. 1986 20 p
(Contract DE-AC04-76DR-00789)
(DE86-013376; SAND-86-8224) Avail: NTIS HC A02/MF A01

The size distribution of particles of unburned aluminum exiting a solid propellant rocket chamber is calculated by extending a previously developed theoretical model. Both one-dimensional and two-dimensional approximations to the chamber flow field are considered, but particle velocity lags are neglected. Results of the one-dimensional analysis differ from the more realistic two-dimensional results in that they predict a lower overall combustion efficiency and a most probable particle size which is always greater than zero. It is argued that these observations can be explained by the fact that the one-dimensional flow field allows many particles to pass through the chamber with a very short residence time. DOE

SIMULTANEOUS ELECTRICAL RESISTIVITY AND MASS UP-TAKE MEASUREMENTS IN BROMINE INTERCALATED FIBERS
Donald A. Jaworske 1986 10 p Presented at the Fall Meeting of the Materials Research Society, Boston, Mass., 1-5 Dec. 1986
(NASA-TM-88900; E-3324; NAS 1.15:88900) Avail: NTIS HC A02/MF A01 CSCL 11G

Changes in mass and electrical resistivity of several types of pitch-based and vapor-grown graphite fibers were monitored during reaction with bromine. The observed threshold pressure dependent reaction suggested that the fibers were intercalated. In the fully brominated compound, the mass was increased by 44 percent and the resistivity was improved by a factor of 17. In the residue compound, the mass was increased by 22 percent and the resistivity was improved by a factor of 5. Fibers possessing different degrees of graphitization had surprisingly similar changes in both mass and resistivity. Author

FINITE ELEMENT ANALYSIS OF COMPOSITE PLATE IMPACTED BY A PROJECTILE Ph.D. Thesis
Brent Ray Petersen 1985 200 p
Avail: Univ. Microfilms Order No. DA8606751

A dynamic finite element computer program was written to determine the displacements and stresses in a layered fiber-reinforced composite materials plate impacted by a projectile. Yang, Norris, and Stavsky plate theory which includes shear deformation and rotary inertia was used. The variational form of the plate equations of motion was derived from Hamilton's principle and was used to derive the finite element plate equations of motion. Newmark's method was used to integrate the finite element equations with respect to time. The diagonal mass matrix was used. Two types of impact were tried, and inelastic impact, where projectile hits the plate and sticks, and a Hertzian impact, were the force between the projectile and the plate is governed by the Hertzian impact law. Both types of impact produced deflections at the center of the plate which agreed well with deflections determined experimentally while the projectile was in contact with the plate. The Gertzian impact method allowed the projectile to lose contact with the plate and impact a second and possibly a third time. A second impact has been observed experimentally. The finite element program was verified by solving the following three problems which have analytical solutions; static deflection of an isotropic plate with a point load at the center, cylindrical bending of an isotropic plate, and free vibration of an isotropic plate. The finite element program was used to solve plate impact problems which do not have analytical solutions. Dissert. Abstr.

EXAMPLE OF THE USE OF DATA ITEM NO. 85001. CHOICE OF REINFORCEMENT FOR A CIRCULAR HOLE IN A FIBRE REINFORCED LAMINATED PLATE. (DATA RELATING TO ONE PARTICLAR SET OF LAMINATE PROPERTIES)
May 1986 14 p
(ESDU-86003; ISBN-0-85679-555-0; ISSN-0141-4097) Avail: ESDU

This Data Item ESDU 86003 is an addition to the Structures and Composites Sub-series. The program of ESDU 85011, which estimates the strain distribution around a circular hole in a fiber-reinforced composite plate, is used to establish the integrity of such a structure. Working in terms of strains and a simplified overall plate criterion, the program can be used to generate design curves for any selected lay-up of layers with any properties. Those design curves can than be used to determine the minimum reinforcement and its lay-up to ensure that local stresses or strains around the hole boundary nowhere exceed some specified allowable values. An an illustration of the method design curves are given for a particular material, and two fully worked examples show how they are used to establish the form of symmetrical reinforcement, or reinforcement on one side of the plate alone, to meet allowable maximum strain values. THE ROLE OF DAMAGE-SOFTENED MATERIAL BEHAVIOR IN THE FRACTURE OF COMPOSITES AND ADHESIVES
T. Ungsuwarungsri and W. G. Knauss 1986 43 p
(Grant NAG1-474)
(NASA-CR-179840; NAS 1.26:179840; SM-85-4-1) Avail: NTIS HC A03/MF A01 CSCL 11D

Failure mechanisms of materials under very high strains experienced at and ahead of the crack tip such as formation, growth, and interaction of microvoids in ductile materials, microcracks in brittle solids or crazes in polymers and adhesives are represented by one-dimensional, nonlinear stress-strain relations possessing different ways by which the material loses capacity to carry load up to fracture or total separation. A double cantilever beam (DCB) type specimen is considered. The nonlinear material is confined to a thin strip between the two elastic beams loaded by a wedge. The problem is first modeled as a beam on a nonlinear foundation. The pertinent equation is solved numerically as a two-point boundary value problem for both the stationary and the quasi-stationay propagating crack. A finite element model is then used to model the problem in more detail in order to assess the adequacy of the beam model for the reduction of experimental data to determine in-situ properties of the thin interlayer. IMPACT AND RESIDUAL FATIGUE BEHAVIOR OF ARALL AND AS6/5245 COMPOSITE MATERIALS
W. S. Johnson Oct. 1986 28 p
(NASA-TM-89013; NAS 1.15:89013) Avail: NTIS HC A03/MF A01 CSCL 11D

Aramide fiber reinforced aluminum laminates (ARALL) represent a cross between resin matrix composites and metals. The purpose of this study was to evaluate the impact sensitivity of this concept. Two types of ARALL (7075 aluminum prestrained and 2024 aluminum not prestrained) were tested through static indentation and the results compared to sheet 2024-T3 and 7075-T6 aluminum alloys. A state-of-the-art composite (AS6/5245) was also tested and compared to the ARALL. Further, the two types of ARALL material and the composite were dynamically impacted at two energy levels and fatigue tested to determine residual fatigue strength. Both forms of the ARALL material had worse impact resistance than monolithic sheet aluminum. The ARALL material made with 2024-T3 aluminum had better impact resistance than did the laminates made with 7075-T6 aluminum. The ARALL materials are at least equal to the composite material in impact damage resistance and are better for impact detection. The composite material has higher residual fatigue strength after impact than the ARALL material and is 25 percent lighter. The prestraining of the ARALL greatly reduces the fatigue growth of impact damage. Author

DISPERSION AND BLENDING OF SiC (SILICON CARBIDE) WHISKERS IN RSP ALUMINUM POWDERS Interim Report
C. J. Skowronek, A. Pattnaik, and R. K. Everett 4 Jun. 1986 13 p
(AD-A168836; NRL-MR-5750) Avail: NTIS HC A02/MF A01 CSCL 11/4

Metal matrix composites (MMC's) of research quality are required to establish reliable relationships between material properties, composition, and processing parameters. Systematic variation of composition and consolidation parameters is necessary to determine their effect on composite mechanical and physical properties. To address the problems of material availability, lack of control of material processing parameters, and nonuniform whisker distribution, a program was instituted to develop a technique for producing a uniform blend of metal powders and whiskers for subsequent consolidation and characterization. An ultrasonic method has been developed for separating silicon carbide (SiC) whiskers in the clusters which are typically found in the as-received SiC whiskers made from rice hulls. The method has also been used to disperse the whiskers uniformly in a -325 mesh rapidly solidified (RSP) aluminum powder. Scanning electron microscopic examination of the separated whiskers and the whisker/aluminum powder blend indicate that the whiskers retain a high length to diameter ratio after processing. Fully dense compacts produced by hot isostatic pressing of the blend exhibit a uniform whisker distribution. r processing. Fully dense compacts produced by hot isostatic pressing of the blend exhibit a uniform whisker distribution. GRA

STATISTICAL STRENGTH COMPARISON OF METAL MATRIX AND POLYMERIC MATRIX COMPOSITES Final Report
Edward M. Wu and Shun-Chin Chou Apr. 1986 33 p
(AD-A168847; MTL-TR-86-11) Avail: NTIS HC A03/MF A01 CSCL 11/4

The reliability of a composite structure depends on the materials strength variability. Unidirectional composites fail sequentially initiating from the very weakest fiber sites with matrix binder, provide local redundancy by transferring load to neighboring fibers until cumulation and clustering of these sites lead to severe stress concentration and ultimate structure failure. As a consequence, the variability of the metal matrix structure is traceable to the strength variability of the constituent fiber, the metal matrix coating process, and the composite wire consolidation process. This report focuses on the partitioning of the first two sources of variability, identification and modeling of the dominant parameters, together with experimental measurements on a current graphite-aluminum composite. The statistical strength of several graphite spools are measured by testing single filament specimens at the beginning and at the end of the spools, thereby characterizing the statistical paraments associated with the strength variability among the spools and within each spool. The graphite-aluminum wire, produced from a continuous liquid infiltration process are tested in tension. The metal matrix statistical strengths from different spools are compared with the respective statistical strength of the parent fiber. The results suggest that, given proper interpretation, single filament fiber strength is a sensitive parameter for quality assurance of metal matrix composites. GRA

STRUCTURES Patent Application
Samuel E. Hailey, inventor (to Air Force) Filed 28 Apr. 1986 21 p
(AD-D012366; US-Patent-Appl-SN-856544) Avail: NTIS HC A02/MF A01 CSCL 11/4

This invention is related to the manufacture of lightweight graphite composite structures. It is particularly related to automated devices for laying structural tape during manufacture of composite parts. The tape laying device comprises a tape laydown head and a plotting mechanism. The tape laydown head has two tape laying rollers arranged side by side and independently controlled. Generally, the tape laying rollers apply tape sequentially to a form as when the tape head is being moved back and forth. The tape head is oriented with a rotary orientation mechanism. A separate supply structure parallel to the tape head houses tape supply reels and tape cutting means. GRA

STRUCTURAL EVALUATION OF HIGH STRAIN FIBER AND RESIN COMPOSITE MATERIAL SYSTEMS Final Technical Report, Sep. 1984 - Jan. 1986
David L. Buchanan and Paul S. McClellan Apr. 1986 90 p
(Contract F33615-84-C-3231)
(AD-A170464; AFWAL-TR-86-3007) Avail: NTIS HC A05/MF A01 CSCL 11/4

The subject of this program was structural evaluation of high strain fiber and resin composite material systems. The objective was to develop a combined analytical and experimental procedure for performing a structural evaluation, then use it to evaluate the effects of recently developed higher strain fibers and resin systems on strength, durability, and damage tolerance of advanced carbon/epoxy composite material systems. Testing included evaluation of basic lamina properties, static and fatigue testing of laminates with and without stress concentrations, evaluation of tolerance to low energy impact damage, and static and fatigue testing of a multifastener metal-to-composite splice joint. Included in the structural evaluation were analytical methods to predict unnotched and notched laminate strength and mode of failure based on unidirectional ply mechanical properties. GRA

MODELING OF INFILTRATION KINETICS AND INTERFACIAL BOND STRENGTH IN ALUMINUM MATRIX-SILICON CARBIDE COMPOSITES Annual Report, 1 May 1986 - 30 Apr. 1986
G. R. Edwards, D. L. Olson, G. P. Martins, B. R. Lanning, and P. B. Maxwell 1986 33 p
(Contract N00014-85-K-0451)
(AD-A170480; CSM-MT-CWR-023) Avail: NTIS HC A03/MF A01 CSCL 11/6

The objective in this research is to gain a fundamental understanding of the wetting and adhesion of aluminum alloys to SiC. The preliminary approach has been to study the infiltration kinetics of molten aluminum alloys into green silicon carbide compacts and relate the results to the interfacial bond strength. Since both infiltration rate and interfacial bond strength are related to the interfacial tension at the interface, our approach has been to isolate those parameters which affect both infiltration kinetics (i.e., viscosity, density, and pre size) and interfacial bond strength (i.e., enthalpies of solution and electronic contributions) and then to correlate the kinetics and bond strength to the most fundamental parameters. EVALUATION OF WATERJET-MACHINED METAL MATRIX COMPOSITE TENSILE SPECIMENS
C. A. Lavender and M. T. Smith Apr. 1986 34 p
(Contract DE-AC06-76RL-01830)
(DE86-012254; PNL-5858) Avail: NTIS HC A03/MF A01

Four magnesium/boron carbide metal matrix composite (MMC) tensile specimens fabricated using the waterjet machining method were evaluated in order to determine the effects of the waterjet material removal process on the composite material surface structure and properties. These results were then compared with data from material conventionally machined. Results showed that while waterjet cutting produces a rough surface finish and does not meet specified dimensional tolerances, the technique appears to be suitable for sectioning and rough machining of metal matrix composites. FRETTING FATIGUE OF CARBON FIBER REINFORCED PLASTIC LAMINATES
Karl Schulte, Stefan Kutter (Ruhr Univ., Bochum, West Germany), and Klaus Friedrich (Hamburg Univ., West Germany) Apr. 1986 141 p In GERMAN; ENGLISH summary
(DFVLR-FB-86-18; ISSN-0171-1342; ETN-86-98185) Avail: NTIS HC A07/MF A01; DFVLR, Cologne, West Germany DM 59

The fretting fatigue properties of two carbon fiber reinforced plastic (CERP) laminates were compared with plain fatigue tests. Nine fretting variants were obtained by varying three different pressures of fretting pads and pad materials. Apart from the strongly different behavior of both laminates, it is shown that there is an essential influence of fretting on the number of cycles until fracture. A reduction of the number of fatigue cycles due to fretting up to three orders of magnitude is observed. ESA

HEAT RESISTANT MATRIX MATERIALS
Ola Dickman Jul. 1986 32 p In SWEDISH; ENGLISH summary
(FOA-C-20618-2.1; ISSN-0347-3694; ETN-86-98330) Avail: NTIS HC A03/MF A01

Epoxy compounds were modified to improve performance in warm or humid environments; the brittleness can be controlled by the hardening process. Polyamide resins were investigated for applications at temperatures higher than admitted for epoxy compounds, but machining difficulties must be overcome. Thermoplastic resins may be less expensive than the epoxy ones, but as they are attacked by volatile liquids, they cannot, probably, be used as a matrix material. Thermoplastic semicristalline resins may be considered as most promising for these applications, as they are very resistant against chemical attack. ESA

HALOE SCIENCE INVESTIGATION Semiannual Progress Report, Feb. - Jul. 1986
D. Chris Benner 1986 4 p
(Contract NCC1-43)
(NASA-CR-179825; NAS 1.26:179825) Avail: NTIS HC A02/MF A01 CSCL 07D

The Halogen Occulation Experiment (HALOE) gas response test simulations were completed using the HALOE spectroscopic instrument model. A new series of programs were written for routine repetitive runs of the spectroscopic model to make it more user friendly for certain studies. Some of the limitations of the model were eased for atmospheric studies. Atmospheric signal profiles were calculated for inclusion in the electronic model programs. Analysis of additional spectral bands of CO2 in the 3 micron region was continued. A program of measurement of the air broadened halfwidths of spectral lines in the nu (sub 3) fundamental band of CH4 was started and over 40 lines measured. B.G.

USER'S MANUAL FOR A TEACH COMPUTER PROGRAM FOR THE ANALYSIS OF TURBULENT, SWIRLING REACTING FLOW IN A RESEARCH COMBUSTOR
Louis M. Chiappetta Sep. 1983 120 p
(Contract NAS3-22771)
(NASA-CR-179547; NAS 1.26:179547; R83-915540-27) Avail: NTIS HC A06/MF A01 CSCL 21B

Described is a computer program for the analysis of the subsonic, swirling, reacting turbulent flow in an axisymmetric, bluff-body research combustor. The program features an improved finite-difference procedure designed to reduce the effects of numerical diffusion and a new algorithm for predicting the pressure distribution within the combustor. A research version of the computer program described in the report was supplied to United Technologies Research Center by Professor A. D. Gosman and his students, R. Benodeker and R. I. Issa, of Imperial College, London. The Imperial College staff also supplied much of the program documentation. Presented are a description of the mathematical model for flow within an axisymmetric bluff-body combustor, the development of the finite-difference procedure used to represent the system of equations, an outline of the algorithm for determining the static pressure distribution within the combustor, a description of the computer program including its input format, and the results for representative test cases. REDUCTIVE DISPROPORTIONATION OF CARBON DIOXIDE BY DIANIONIC CARBONYLMETALATES OF THE TRANSITION METALS
Gary R. Lee, John M. Maher, and N. J. Cooper 25 Apr. 1986 32 p
(Contract N00014-83-K-0292)
(AD-A168211; TR-4) Avail: NTIS HC A03/MF A01 CSCL 07/3

Carbon dioxide reacts readily with M2(M'(CO)5) (M = Li, Na, K, M' = W; M = K, M' = Cr, Mo, W) to give the corresponding group 6 hexacarbonyls (M(CO)6) and alkali metal carbonates. The reaction of Li2(W(CO)5) with excess 13CO2 at -78 C gives (W(CO)5(13CO)), confirming that the reaction involves reductive disproportionation of CO2 to CO and CO3(2-). The group 8 carbonylmetalates Na2(M(CO)4) (M = Fe, Ru, Os) react with CO2 to give (M(CO)5) and carbonate, and Na2(V(eta-C5H5)(CO)3) reacts with CO2 to give (V(eta-C5H5)(CO)4) and carbonate, indicating that reductive disproportionation is a general reaction of dianionic carbonylmetalates with CO2. Careful addition of one equivalent of CO2 to a solution of Li2(W(CO)5) at -78 C leads to an intermediate 1:1 adduct with an IR spectrum consistent with formulation as Li2(W(CO)5(eta 1-CO2)). The principal 13C absorption at 223.4 delta of a sample of Li2(W(CO)5(eta 1-13CO2)) prepared at -78 C exhibits Jw-c = 92 Hz, consistent with the central C being directly bonded to W and sp(2) hybridized. Oxide scrambling from coordinated CO2 to coordinated CO at higher temperatures results in complex signals between 205 and 201 sigma assigned to the carbonyl ligands. GRA

LIFETIMES AND QUENCHING OF THE B STATE OF PO BY ATMOSPHERIC GASES Final Report
Koon N. Wong, William R. Anderson, Anthony J. Kotlar, Mark A. DeWilde, and Leon J. Decker Apr. 1986 46 p
(AD-A168735; BRL-TR-2725) Avail: NTIS HC A03/MF A01 CSCL 07/4

The PO radical was studied because of its importance in several proposed laser photolysis detection schemes for nerve agents under atmospheric conditions. For this reason, interactions of the radical with atmospheric constituents were studied. Pulsed laser excited fluorescence in the B doublet sigma plus - X doublet pi system of gas phase PO was used to measure the lifetime for v' = 0 of the B state. Rotationally resolved measurements for a few selected J' levels, at Ar or He carrier gas pressures of 2 torr, reveal no dependence of the lifetime on the rotational level excited. Earlier measurements of relative fluorescence intensities in the V' = o vibrational progression were reinterpreted to extract the dependence of the electronic transition moment on internuclear distance. Rate constants for quenching of the B state of PO by N2, O2, CO2, and H2O, and upper limits thereof for He and Ar are reported. O2 was found to react with ground state PO. A crude measurement of the rate constant was performed. The poor agreement is in excellent agreement with the previous measurement, but in poor agreement with that of a concurrent study. Further work is required to determine the reason for the discrepancy. GRA

KINETIC AND SPECTROSCOPIC STUDIES OF CHEMICAL INTERMEDIATES AT BOTH HIGH AND LOW TEMPERATURES Final Report, 15 Dec. 1983 - 14 Dec. 1985
Peter Borrell Feb. 1986 20 p
(Grant AF-AFOSR-0035-84)
(AD-A168758; EOARD-TR-86-03) Avail: NTIS HC A02/MF A01 CSCL 07/4

The temperature dependence of the rate constants of a number of elementary energy transfer, chemical and chemiluminescent reactions was measured using a combined discharge-flow/shocktube technique. In addition, the method itself was developed to provide a low temperature (to 100 K) capability. The reactions studied were: The collisional deactivation of O2(b prime sigma g) and O2(a prime delta g) by N2 and H2; the reactions of atomic nitrogen and oxygen with air (Lewis Rayleigh and Air Afterglows); and the quenching of O2(a prime sigma g) by O2 itself. The emissivity of the dimol transition of O2(a prime sigma g) was also measured. GRA

THE EFFECT OF HIGH PRESSURE ON ELECTRICAL RELAXATION IN PPO AND ELECTRICAL CONDUCTIVITY IN PPO COMPLEXED WITH LITHIUM SALTS Interim Technical Report
John J. Fontanella and Mary C. Wintersgill Jun. 1986 39 p
(AD-A168894; TR-22) Avail: NTIS HC A03/MF A01 CSCL 07/4

Audio frequency electrical conductivity and relaxation studies have been carried out on Parel 58 elastomer and Parel 58 elastomer complexed with a variety of lithium salts. The measurements have been carried out in vacuum over the temperature range 5-380 K and at pressures up to 0.65 GPA over the temperature range 230 to 380 K. Both the electrical conductivity for the complexed material and the electrical relaxation time associated with the alpha relaxation in the uncomplexed material exhibit VTF or WLF behavior. From the VTF analysis for both the vacuum electrical relaxation time and electrical conductivity, E sub a is found to be about 0.09 eV and T sub o is found to be about 40 C below the central glass transition temperature. In addition, it is found that the activation volumes for the electrical relaxation time and the electrical conductivity are the same when compared relative to t sub o. These results imply that the mechanism controlling ionic conductivity is the same as that for the alpha relaxation namely large scale segmental motions of the polymer chain. GRA

CALCULATION OF POTENTIAL ENERGY SURFACES FOR HCO AND HNO USING MANY-BODY METHODS Final Report
George F. Adams and Gary D. Bent Jun. 1986 50 p
(AD-A169611; BRL-TR-2737) Avail: NTIS HC A03/MF A01 CSCL 07/4

Many-body perturbation theory calculations of the potential energy surfaces pertinent to the hydrogen dissociation reaction of the ground state of the formyl radical and the three lowest electronic states of hydrogen nitroxide are summarized. The calculations established that MBPT provides a reasonable description of the reaction pathway for those molecules not requiring a multiconfigura-

tion zeroth order wavefunction. The data obtained for the three states of NHO provide basis for a statistical estimate of relative recombination rates in production of these states, leading to a plausible identification of the source of the chemiluminescence that characterizes this chemical species. SAFETY ASPECTS OF LARGE-SCALE COMBUSTION OF HYDROGEN
F. J. Edeskuty, J. J. Haugh (Electric Power Research Inst., Palo Alto, Calif.), and R. T. Thompson (EG and G Energy Measurements, Inc., Las Vegas, Nev.) 1986 13 p Presented at the 6th CERI World Hydrogen Energy Conference, Vienna, Austria, 20 Jul. 1986 Prepared in cooperation with Electric Power Research Inst., Palo Alto, Calif.; EG and G Energy Measurements, Inc., Las Vegas, Nev.
(Contract W-7405-eng-36)
(DE86-007375; LA-UR-86-669; CONF-860704-2) Avail: NTIS HC A02/MF A01

Recent hydrogen-safety investigations have studied the possible large-scale effects from phenomena such as the accumulation of combustible hydrogen-air mixtures in large, confined volumes. Of particular interest are safe methods for the disposal of the hydrogen and the pressures which can arise from its confined combustion. Consequently, tests of the confined combustion of hydrogen-air mixtures were conducted in a 2100 m³ volume. These tests show that continuous combustion, as the hydrogen is generated, is a safe method for its disposal. It also has been seen that, for hydrogen concentrations up to 13 vol %, it is possible to predict maximum pressures that can occur upon ignition of premixed hydrogen-air atmospheres. In addition information has been obtained concerning the survivability of the equipment that is needed to recover from an accident involving hydrogen combustion. An accident that involved the inadvertent mixing of hydrogen and oxygen gases in a tube trailer gave evidence that under the proper conditions hydrogen combustion can transit to a detonation. If detonation occurs the pressures which can be experienced are much higher although short in duration. DOE

SUPERCRITICAL FLUID CHROMATOGRAPHY/SUPERSONIC JET SPECTROSCOPY Progress Report, Feb. 1 - 30 Apr. 1986
M. L. Lee and S. R. Goates 1986 14 p
(Contract DE-FG22-83PC-60807)
(DE86-011278; DOE/PC-60807/12) Avail: NTIS HC A02/MF A01

Some minor modifications to the supercritical fluid fractionation apparatus were made during this quarter to optimize the performance of the unit. It was decided that a thorough study of the potential of CO2 for the fraction of high-molecular-weight and polar polycyclic aromatic compounds (PAC) be undertaken before construction of the high temperature apparatus should begin. Two main factors were considered when making this decision. First, theoretical solubility parameter data suggested that CO2 might be a better solvent than n-pentane for high-molecular-weight PAC. Second, there were some indications that coal extracts and high-molecular-weight coal-derived fluids could undergo structural changes when heated. Aromatization, condensation, rearrangements, and other types of chemical reactions are expected to occur in coal mixtures at temperatures above 60 C. Therefore, a low temperature fractionation procedure would be much more desirable than a high temperature one. Also, over the past several months, detailed spectroscopic investigations of supercritical fluid/supersonic expansions for several supercritical fluid solvents have been made, including n-pentane, CO2, SF6, and N2O, using as test sample compounds, naphthalene and perylene. During the past quarter, we have concentrated especially on obtaining spectra of perylene which provides a more rigorous test of the system did earlier work with naphthalene. DOE

STRUCTURE AND ACTIVITY OF Pt-Co ALLOYS AS OXYGE REDUCTION ELECTROCATALYSTS
B. C. Beard and P. N. Ross, Jr. Mar. 1986 30 p
(Contract DE-AC03-76SF-00098)
(DE86-012831; LBL-21184) Avail: NTIS HC A03/MF A01

Carbon supported Pt-Co (3:1 atom ratio) catalysts were prepared in both acid and alkaline aqueous media, followed by heat treatments to promote alloy formation. Both preparations began with a commercial 10% Pt on carbon catalyst with Pt particle sizes of 15 to 30 A. Significantly greater alloying was observed in the acid media prepared catalyst. X-ray diffraction studies of the acid prepared catalyst demonstrated lattice parameters tending away from Pt (3.937 A) and toward that for Pt3Co (3.831 A), greatly increased particle sizes, and significant ordering evidenced by the presence of superlattice reflections. In all cases, the base media prepared catalysts were alloyed to a lesser extent, were of moderately increased particle size and gave no indication of alloy ordering. Activity testing under phosphoric acid fuel cell conditions demonstrated that the most highly alloyed catalysts had the greatest activity. Loss of cobalt in the phosphoric acid environment was the lowest in catalysts which were the most alloyed. DOE

N87-11868# Stanford Univ., Calif.
COMBUSTION GAS SPECTROSCOPY USING TUNABLE LASERS Final Progress Report, 1 Aug. 1983 - 31 Jan. 1986
R. K. Hanson 1986 15 p
(Contract DE-AS03-76ER-70058)
(DE86-012873; DOE/ER-70058/T3) Avail: NTIS HC A02/MF A01

This report summarizes progress during the past 24 months of an ongoing program to develop and apply tunable laser techniques for the measurement of fundamental spectroscopic parameters (line and oscillator strengths, collision linewidths and fluorescence quenching factors) of combustion species. Laser sources utilized include a tunable CW infrared diode laser and a tunable CW visible/UV ring dye laser. During this reporting period, research has proceeded in several areas, including: tunable diode laser measurements of HCN (3-micron band) infrared spectroscopic parameters (band strength and collision linewidths) in a room temperature absorption cell and a shock tube; advanced absorption lineshape model incorporating collision-narrowing (as well as broadening) effects, and its use in fitting high-resolution HCN absorption spectra; wavelength modulation techniques, using a fast-tuning, CW ring dye laser system (visible and intracavity-doubled UV), for absorption and fluorescence measurements of spectroscopic parameters in shock-heated and combustion flows; design and fabrication of a s pecial shock tube test section to enable tunable laser absorption and fluorescence measurements behind reflected shock waves; assembly of computer codes for prediction of gas composition and thermodynamic conditions behind

reflected shock waves in reacting gases, and experimental validation of predicted postshock behavior. DOE

APPLICATION OF COMPUTER TECHNIQUES IN THE PREDICTION OF INORGANIC COMPOUNDS
E. M. Savitskii and V. B. Gribulya 1985 255 p Transl. into ENGLISH of the book "Prognozirovanie Neorganicheskikh Soedinenii s Pomoshchyu EVM" Moscow, USSR, Nauka, 1977 p 1-244 (PB86-205762; TT-79-52025) Avail: NTIS HC A12/MF A01 CSCL 07B

Some results of the study of the application of cybernetics in the prediction of inorganic compounds belonging to binary physico-chemical systems were presented. Computational data on prediction are presented in tables which include all binary systems. The possibility of predicting numerical values of characteristics of compounds with the help of a computer is indicated in those cases where information regarding their behavior patterns may not be available. The book contains a description of the methodological principles of prediction and also reference material necessary in the search for and synthesis of new inorganic substances. The book is intended for scientists and engineers working in the fields of materials science, inorganic chemistry, chemical cybernetics, as also for specialists concerned with the problems of the search for and synthesis of new inorganic materials. GRAIN BOUNDARY OXIDATION AND FATIGUE CRACK GROWTH AT ELEVATED TEMPERATURES Final Report
H. W. Liu and Yoshiki Oshida Oct. 1986 30 p
(Grant NAG3-348)
(NASA-CR-179529; NAS 1.26:179529) Avail: NTIS HC A03/MF A01 CSCL 11F

Fatigue crack growth rate at elevated temperatures can be accelerated by grain boundary oxidation. Grain boundary oxidation kinetics and the statistical distribution of grain boundary oxide penetration depth were studied. At a constant delta K-level and at a constant test temperature, fatigue crack growth rate, da/dN, is a function of cyclic frequency, nu. A fatigue crack growth model of intermittent micro-ruptures of grain boundary oxide is constructed. The model is consistent with the experimental observations that, in the low frequency region, da/dN is inversely proportional to nu, and fatigue crack growth is intergranular. Author

PRIMARY ARM SPACING IN CHILL BLOCK MELT SPUN Ni-Mo ALLOYS
S. N. Tewari and T. K. Glasgow 1986 21 p Presented at the Symposium on Enhanced Properties in Structural Metals via Rapid Solidification, Orlando, Fla., 6 Oct. 1986; sponsored by the American Society for Metals
(NASA-TM-88887; E-3297; NAS 1.15:88887) Avail: NTIS HC A02/MF A01 CSCL 11F

Chill block melt spun ribbons of Ni-Mo binary alloys containing 8.0 to 41.8 wt % Mo have been prepared under carefully controlled processing conditions. The growth velocity has been determined as a function of distance from the quench surface from the observed ribbon thickness dependence on the melt puddle residence time. Primary arm spacings measured at the midribbon thickness locations show a dependence on growth velocity and alloy composition which is expected from dendritic growth models for binary alloys directionally solidified in a positive temperature gradient. GEOMETRIC STRUCTURE, PSEUDO BAND GAPS, AND SURFACE VIBRATIONAL RESONANCES ON METAL SURFACES Interim Report
M. Persson, Joseph A. Stroscio, and W. Ho Feb. 1986 52 p
(Contract N00014-82-K-0576)
(AD-A168291) Avail: NTIS HC A04/MF A01 CSCL 20/12

It is shown by surface lattice dynamics that a new class of surface vibrational resonances arises in those frequency regions where there is a strong depletion in the bulk phonon density of

states. The presence of these pseudo band gaps is due to the higher Fourier components in the phonon dispersion relations introduced by the particular coordination of atoms in layers parallel to the surface. This phenomenon is illustrated for the fcc (110) surfaces of Cu and Ni and bcc (111) surface of Fe. The pseudo band gap is found to be more pronounced for the longitudinal phonons propagating in the bcc (111) than the fcc (110) directions due to the additional strong multiple interlayer forces arising from its geometric structure. A quantitative analysis based on surface lattice dynamics of the recorded electron energy loss spectra of Cu and Ni suggests that the surface interlayer force constant attains the same value as in bulk, and that the two outermost layers give the dominant contribution to the dipole activity. This resonance is found to exist throughout the gamma-X direction and makes an avoided crossing with a resonance derived from a band gap at the X-point. This novel dispersion behavior should be possible to observe by electron or atom scattering at larger parallel wavevector transfers.

CARBURIZING STEEL FOR HIGH TEMPERATURE SERVICE Final Report, 1982 - Dec. 1984
T. B. Cameron and D. E. Diesburg Aug. 1985 53 p
(Contract DAAG46-82-C-0066)
(AD-A168327; Rept-82-C-66; AMMRC-TR-85-25) Avail: NTIS HC A04/MF A01 CSCL 13/8

A prime concern in airborne equipment is to avoid a brittle fracture in gearing or bearings which could lead to catastrophic engine or propulsion system failure. Projected requirements for advanced aircraft and helicopters suggest that currently employed through-hardened materials will no longer be adequate for these applications due to their low fracture toughness. Hence there is an interest in carburized materials which have somewhat similar surface characteristics to the through-hardened materials but inherently higher core toughness due to the lower core carbon levels. Five steels similar in composition to CBS1000 and a low carbon M50 composition were evaluated with respect to carburizing characteristics, temper resistance, hot hardness and carburized fracture toughness. Si, Mo and Ni levels were varied in an effort to identify a composition that would maintain a surface hardness of 58 HRC minimum at 315 C (600 F) without a deterioration in fracture toughness properties. Si and Ni were both shown to retard carburization but have little influence on hardness retention or fracture toughness. A composition with 2.3% Ni was shown to have optimum carburizing, hardness and fracture toughness properties. The modified steel showed an improvement over CBS1000 in case fracture toughness but the core fracture toughness was lower than that of CBS1000. This steel was tested in rolling contact fatigue and found to be similar in performance to through-hardened M50.

IMPROVEMENT IN DUCTILITY AND FRACTURE TOUGHNESS OF HIP'D AND ISOTHERMALLY FORGED Ti-6Al-6V-2Sn POWDER WITH HEAT TREATMENT Final Report, Jun. 1978 - Jun. 1986
Ronald P. Simpson, Attwell M. Adair, Francis H. Froes, and Daniel Eylon Jun. 1986 76 p
(AD-A168804; AFWAL-TR-86-4064) Avail: NTIS HC A05/MF A01 CSCL 11/6

This program was aimed at optimizing the mechanical behavior of powder metallurgy compacts of the Ti-6Al-6V-2Sn alloy. Particular emphasis was placed on breaking-up continuous grain boundary alpha which previous work had indicated was detrimental to the properties of concern, particularly ductility and fracture toughness. A range of microstructures were produced in Hydride-Dehydride and Rotating Electrode Powder Compacts using combinations of hot isostatic pressing, extrusion, isothermal forging and heat treatment. Based on the microstructural studies, two heat treatments were selected and used in combination with powder compaction (hot isostatic pressing or extrusion) and isothermal forging to develop mechanical properties which were correlated with processing, microstructure and fractographic features. Tw types of microstructures were identified as having acceptable leve of strength, ductility and fracture toughness: (1) a high volun fraction of fine equiaxed primary alpha in a matrix of transform beta, and (2) a relatively coarse secondary alpha plate dispersi in combination with a small volume fraction of large low aspe ratio primary alpha. The processing routes necessary to develo structures were defined.

THE ELASTIC CONSTANTS OF NI3AI TO 1.4 GPa Fin Report
J. Frankel, J. Vassiliou, J. C. Jamieson, D. P. Dandekar, and W Scholz May 1986 18 p
(AD-A168813; ARCCB-TR-86018) Avail: NTIS HC A02/MF A0 CSCL 11/6

Ni3Al, having the L1 sub 2 ordered structure, belongs to class of intermetallic compounds which shows unusual mechan cal behavior, namely a peak in mechanical strength with a increase in temperature. The peak temperature for Ni3Al is 922 k where the yield stress value is four times its value at roor temperature. A large number of investigations determining th dependence of different physical properties as a function o temperature have been done, but the pressure dependence o the properties of Ni3Al remains to be investigated in depth. Th present report fills this gap in our information by determining th pressure dependence of the three elastic constants c11, c12, an c44 of single-crystal Ni3Al to 1.4 GPa at room temperature. Th pressure derivatives of the elastic constants of single-crystal Ni3A have been determined to 1.4 GPa by both superposition an pulse-echo overlap techniques. Measurements were made o single-crystal specimens of orientation <100> and <110>, thu providing at least one cross-check. The values of c11, c12, an c44 at one atmosphere are found to be 223.5, 149.0, and 12.9 GPa respectively. The pressure derivatives of the elastic constants have been determined.

EFFECT OF LASER HARDENING ON MICROSTRUCTURE AND WEAR RESISTANCE IN MEDIUM CARBON/CHROMIUM STEELS
J. Kusinski and G. Thomas Apr. 1986 22 p Presented at the Society of Photo-Optical Instrumentation Engineers International Symposium: Topics in Optical and Optoelectronic Applied Sciences and Engineering, Quebec City, Ontario, 2 Jun. 1986
(Contract DE-AC03-76SF-00098)
(DE86-012021; LBL-21418; CONF-860620-6) Avail: NTIS HC A02/MF A01

Metallographical (optical, TEM, SEM), spectroscopic, abrasive wear resistance and microhardness investigations of Fe/Cr/Mn/C steels heat treated by a continuous CO2 laser are described. Laser hardening resulted in wear resistance of 1.4 to 1.6 times better than that of conventionally hardened steels. Laser melting followed by rapid solidification allows formation of a solidified layer with high wear resistance only when the scanning velocity and mass of the samples were sufficient to realize high cooling rates. The variations in the wear resistance and microhardness with distance from the heated surface were similar. The grain refinement caused by rapid laser-heating and high stresses induced during cooling create essentially fine, highly dislocated lath and internally twinned martensites with some amount of stable, interlath retained austenite. This structure has in turn beneficial effects on wear resistance and toughness. Laser-heat treatment for deep melting of the surface layers of the steels shows only a small improvement in wear resistance. Such heat treatment results in delta ferrite retention (10Cr steel) and chromium segregation to cell boundaries.

INFLUENCE OF DISPLACEMENT DAMAGE ON DEUTERIUM PERMEATION IN 316 STAINLESS STEEL
B. L. Doyle and D. K. Brice 1986 20 p Presented at the 7th

International Conference on Plasma Surface Interactions in Controlled Fusion Devices, Princeton, N.J., 5 May 1986
(Contract DE-AC04-76DP-00789)
(DE86-010463; SAND-85-2866C; CONF-860522-16) Avail: NTIS HC A02

A new permeation system for in situ measurements of the effect of radiation damage on both gas and plasma-driven hydrogen permeation through metal foils has been developed. The source of displacement damage was a beam of 16 MeV carbon ions whose range was significantly greater than the 4 micron foil thickness. Initial ion-driven deuterium permeation results for 316 stainless steel show no evidence for radiation-enhanced effects for temperatures in the range 200 to 400C and displacement damage rates of 0.5 dpa/day. An upper limit for the radiation enhancement of the diffusion coefficient of 100%/(dpa/day) has been established. Good agreement between this data and a transport parameter calculation modified to handle gases has been obtained.

DISCUSSION OF THE EFFECT OF TEMPERATURE ON THE VERY SHORT TERM PROPERTIES OF METALS AND ALLOYS
S. A. Lee May 1983 33 p
(BAe-BT-14842; LR48867; ETN-86-97967) Avail: NTIS HC A03/MF A01

Material property data for long and short term exposure to high temperatures are compared and the differences observed are explained with reference to the metallurgical stability of the material. The strength behavior of metals containing even small amounts of solute elements varies with temperature and with time. The timewise stability of metal alloys is reduced by strengthening treatments. By modifying the treatments given to alloys for use in short lifetime structures, it may be possible to delay the onset of loss of mechanical properties to a point beyond mission duration.

(Contract ESTEC-4862/81-NL-JS)
(ESA-CR(P)-2262; ETN-86-98147) Avail: NTIS HC A04/MF A01

The properties of the Inconel 718 alloy in the presence of pressurized hydrogen are reviewed. A hydrogen container for space application is studied at different temperatures, determining the hydrogen loss and the fatigue resistance. The study includes a qualification procedure to test permeability and weld quality by the acoustic emission method. The test results indicate that permeability is low, and the mechanical resistance is above twice the utilization pressure.

PERFORMANCE LIMITS OF SURFACE-HARDENED ALUMINUM-ALLOY GEARS IN VACUUM
K. T. Stevens Paris ESA Dec. 1985 23 p
(Contract ESA-5615)
(ESA-ESTL-059; ESA-CR(P)-2237; ETN-86-98115) Avail: NTIS HC A02/MF A01

The surfaces of aluminum alloy gears operating in vacuum were treated by Ematal anodizing and the Zinal diffusion process. Without lubrication, both surface treatments fail quickly by cracking of the brittle coatings and subsequent flaking. Treated aluminum gears are not, therefore, recommended for spacecraft applications which demand more than a few thousand tooth encounters. Lubrication with sputter-deposited MoS2 increases the endurance of the Ematal coating by a factor of 15, to 2 million gear revolutions. Coupling an Ematal-treated gear with a self lubricating polyimide/MoS2 gear extends the life further, with no failure after 10 million gear revolutions.

FATIGUE PROPERTIES OF HIGH STRENGTH TITANIUM ALLOYS AT ELEVATED TEMPERATURES (IMI 685)
Roelof Marissen, Manfred Peters, Karl Schulte, Karl-Heinz Trautmann, Klaus Mull, and Horst Nowack May 1986 42 p
(DFVLR-FB-86-19; ISSN-0171-1342; ETN-86-98277) Avail: NTIS HC A03/MF A01; DFVLR, Cologne, West Germany DM 17

The fatigue properties of the Ti alloy IMI 685 were studied at room temperature and at 450 C. At both temperatures lamellar type microstructures show improved fatigue crack propagation behavior compared to equiaxed structures. Similar results are found for low cycle fatigue tests, whereas in the high cycle fatigue range the equiaxed microstructures are superior. Creep deformations and strain aging are thought to play an important role in high temperature fatigue properties.

APPLICATION OF THE KEY CURVE AND MULTI-SPECIMEN TECHNIQUES TO DYNAMIC J-R CURVE TESTING OF ALLOY STEEL
J. A. Joyce and E. M. Hackett (Naval Ship Research and Development Center, Annapolis, Md.) 1986 63 p
(TI86-901252; NUREG/CR-4579) Avail: NTIS HC A04/MF A01

J-integral R-curve tests were performed on three point bend specimens of a 3-Ni steel at three loading rates; quasi-static, intermediate (25mm/sec) and a drop tower rate (2.54m/sec). The key curve and multispecimen procedures were employed for the higher rate tests and this investigation is focused primarily on details of the test method development. The multispecimen and key curve techniques were found to yield agreement at the elevated loading rates. Numerical smoothing techniques required to apply a key curve method appear to separate the oscillatory high frequency component from the load-displacement record. For the 3-Ni steel tested both J-integral at crack initiation and tearing modulus were found to be elevated with increasing loading rate.

PERFORMANCE DEMONSTRATION TESTS FOR DETECTION OF INTERGRANULAR STRESS CORROSION CRACKING
P. G. Heasler, D. J. Bates, T. T. Taylor, and S. R. Doctor Feb. 1986 65 p Prepared in cooperation with Nuclear Regulatory Commission, Washington, D. C.
(TI86-007894; NUREG/CR-4464; PNL-5705) Avail: NTIS HC A04/MF A01

Detection tests of inservice inspectors, procedures and equipment that are employed to find intergrandular stress corrosion cracks in nuclear power plant piping are evaluated. Performance is described by two fundamental parameters: false cell probability and probability of detection. Acceptable inspection performance and detection tests are therefore defined in terms of these two parameters.

MECHANICAL PROPERTIES OF VARIOUS ALLOYS IN HYDROGEN Final Report
Nigel L. Weeks and J. Mucci Jun. 1986 30 p
(Contract NAS8-36040)
(NASA-CR-178874; NAS 1.26:178874; FR-19269) Avail: NTIS HC A03/MF A01 CSCL 11F

Notch tensile tests were conducted to determine the tensile strength of experimental alloys proposed for use in a pressurized gaseous hydrogen environment. The experimental alloys were processed and supplied by the Marshall Space Flight Center. They were supplied in four groups: nickel-base alloys, iron-base alloys, beryllium alloys, and the single-crystal alloy PWA 1480 in seven crystallographic orientations. Testing of the nickel-base, iron-base, and beryllium alloys established the comparative ambient temperature notch tensile strength in 34.5 MPa (5000 psig) gaseous hydrogen environment. After the test results were documented and reported, the test specimens were returned for evaluation. Testing of the single-crystal alloy, PWA 1480, established the notched tensile strength for the various crystallographic orientations in 34.5 MPa (5000 psig) gaseous helium and hydrogen environments at 871 C (1600 F). Strengths established in hydrogen were compared to those in helium to determine environmental degradation due to hydrogen. For the nickel-base alloys, iron-base alloys, and the beryllium alloys, environmental degradation could not be established as no helium environment tests were conducted.

ENVIRONMENTALLY STABLE POLYMERS AND COATINGS FOR SPACE APPLICATION: CH-5, SUPPLEMENT 10 Final Report
George Sykes Oct. 1986 39 p
(Grant NAG1-343)
(NASA-CR-177181; NAS 1.26:177181) Avail: NTIS HC A03/MF A01 CSCL 11B

High molecular weight, randomly coupled poly(imide siloxane) soluble block copolymers were synthesized from bis(amino propyl) polydimethylsiloxane equilibrates of various molecular weights, aromatic metalinked diamines, and 3,3'-4,4'-benzophenone tetracarboxylic dianhydride (BTDA). Two synthetic procedures were successfully used to synthesize the poly(amic acid siloxane) intermediates. For both synthetic procedures, a cosolvent system was employed to achieve complete solvation of all components throughout the polymerization. Physical property characterization is continuing.

POLYIMIDES CONTAINING OXYETHYLENE UNITS. PART 4: POLYMERIZATION OF DIANHYDRIDES CONTAINING ETHER LINKAGES
Frank W. Harris (Akron Univ., Ohio), Andrea J. Karnavas, Sajal Das, Charles N. Cucuras, and Paul M. Hergenrother 1986 5 p
(NASA-TM-89257; NAS 1.15:89257) Avail: NTIS HC A02/MF A01 CSCL 11B

The development of new composite resins for various aerospace applications is attempted. Although it is highly desirable that these polymers be soluble in order to facilitate processing, they must display considerable solvent-resistance in use. A recent approach has involved the synthesis of a new series of polyimides containing flexible linkages. The polymers were prepared by the polymerization of aromatic dianhydrides with diamines containing oxyethylene linkages. For example, the polymerization of 3,3',4,4'-benzophenonetetracarboxylic dianhydride (BTDA) with 1,2-bis(4-aminophenoxy)ethane (1a) and bis[2-(4-aminophenoxy)ethyl]ether (lb), afforded highly crystalline polyimides that were completely insoluble. However, a polyimide that was amorphous and soluble was obtained from the polymerization of BTDA and an isomer of lb, i.e., bis[2-(3-aminophenoxy)ethyl] ether (4b). In an attempt to obtain a soluble, amorphous polyimide that could be annealed into a crysalline state, block copolymers of 1b and 4b and BTDA were prepared. Copolymers containing less than 20 weight % 1b were soluble in organic solvents. However, these polymers did not crystallize when heated above their Tg's. Copolymers containing higher levels of 1b were semicrystalline and insoluble. The polymerization of the diamines containing oxyethylene linkages with 4,4'-oxydiphthalic anhydride (ODPA) and a new dianhydride, i.e., 4,4'-oxyethyleneoxyethyleneoxydiphthalic anhydride (OEDA) was investigated. It was postulated that the use of these more flexible dianhydrides would result in more processable polyimides. Author

THERMAL BARRIER COATING LIFE PREDICTION MODEL DEVELOPMENT Annual Report
Jeanine T. DeMasi 5 Nov. 1986 213 p
(Contract NAS3-23944)
(NASA-CR-179508; NAS 1.26:179508; AR-2) Avail: NTIS HC A10/MF A01 CSCL 11G

A methodology is established to predict thermal barrier coating life in a environment similar to that experienced by gas turbine airfoils. Experiments were conducted to determine failure modes of the thermal barrier coating. Analytical studies were employed to derive a life prediction model. A review of experimental and flight service components as well as laboratory post evaluations indicates that the predominant mode of TBC failure involves thermomechanical spallation of the ceramic coating layer. This ceramic spallation involves the formation of a dominant crack in the ceramic coating parallel to and closely adjacent to the topologically complex metal ceramic interface. This mechanical failure mode clearly is influenced by thermal exposure effects as shown in experiments conducted to study thermal pre-exposure and thermal cycle-rate effects. The preliminary life prediction model developed focuses on the two major damage modes identified in the critical experiments tasks. The first of these involves a mechanical driving force, resulting from cyclic strains and stresses caused by thermally induced and externally imposed mechanical loads. The second is an environmental driving force based on experimental results, and is believed to be related to bond coat oxidation. It is also believed that the growth of this oxide scale influences the intensity of the mechanical driving force. Author

THERMAL CONDUCTIVITY OF PRISTINE AND BROMINATED P-100 FIBERS
Ching-cheh Hung and John Miller (Kenyon Coll., Gambier, Ohio) 1986 19 p Presented at the March meeting of the American Physical Society, Las Vegas, Nev., 31 Mar. - 4 Apr. 1986
(NASA-TM-88863; E-3263; NAS 1.15:88863) Avail: NTIS HC A02/MF A01 CSCL 11C

Thermal conductivity of brominated and pristine Union Carbide P-100 graphite fibers in the 30 to 160 C temperature range was determined by measuring thermal conductivities of graphite fiber epoxy composite samples and then excluding the epoxy contribution. A comparative thermal conductivity instrument was used to measure the thermal conductivity of the samples containing fibers. Results showed that the thermal conductivity values were 225 to 370 w/m-K and 215 to 340 w/m-K for pristine and brominated fibers, respectively. Furthermore, the thermal conductivity ratio of brominated to pristine P-100 fibers was 0.89, 0.91, and 0.92 at 55 to 80 C; 108 and 130 C, respectively. Such decrease in thermal conductivity results almost entirely from the 10 percent increase in fiber cross sectional area due to bromination. This result suggests that bromination effects on P-100 fiber structure is small, and that some structural changes, presumably the sharp-angled domain wall

becomes less sharp, occurring in the 80 to 108 C temperature range. Author

DEVELOPMENT/APPLICATIONS OF FT-IR ATR (FOURIER TRANSFORM IR ATTENUATED TOTAL INTERNAL REFLECTION) AND PHOTOACOUSTIC DICHROISM TECHNIQUES FOR STRUCTURAL CHARACTERIZATION OF POLYMER SURFACES
Final Report, 1978 - 1985
C. S. Sung 28 May 1986 5 p
(Contract N00014-78-C-0676)
(AD-A168519; U-136) Avail: NTIS HC A02/MF A01 CSCL 07/4

The main objective of this project was to develop new techniques for the characterization of polymer surfaces and interfaces, based on Fourier Transform IR attenuated total internal reflection (ATR) and photoacoustic dichroism (PAS) methods. The project involved both development of FT-IR PAS and ATR dichroism techniques using a specially designed crystal and attachment, and the demonstration of these techniques for the molecular characterization of selected polymer surfaces. Measurement of bulk molecular orientation and degree of crystallinity by transmission IR dichroism is only applicable to very thin polymer films. For thick samples, ATR dichroism was potentially useful, but severe experimental difficulties were encountered in adapting ATR dichroism for the use of the broad polymer community. The major effort during the initial period of the project was devoted toward developing a modified ATR attachment, using a symmetrical, double-edged internal reflection crystal. This modified attachment allows the sample to be rotated without disassembling and reassembling operations which change the contact area between the polymer sample and the ATR crystal. This eliminated the need for the correction of the reflectivities to an internal standard band. The usefulness of this attachment which provides information on two-dimensional orientation has been demonstrated on two types of polypropylene, uniaxially drawn and injection molded. GRA

EXPANDABLE EPOXY APPLICATION Final Draft Report
T. F. Davidson and G. Rogowski 25 Apr. 1986 35 p
(Contract DASG60-84-C-0112)
(AD-A168669; ARC-TR-PL-11976) Avail: NTIS HC A03/MF A01 CSCL 11/4

Epoxy resins are widely used throughout the industry as the matrix in structural composites. Epoxides undergo the least amount of shrinkage during cure of the available composite matrices. However, this shrinkage does affect a reduction in the performance of the composite. This reduction in performance can be the result of poor adhesion between the matrix and the reinforcing fibers or the formation of stress concentrations in the matrix due to the presence of microcracks, both of which lead to the failure of the composite. Cyclic monomers which undergo expansion during a cationic ring opening polymerization have the potential of reducing or eliminating the shrinkage that occurs in epoxy resins. The expansion of the monomers during the polymerization process is due to the transformation of covalent bonds in the monomer ring to Van der Waals type interactions with the formation of the polymer. This expansion can also occur if the cyclic monomers are copolymerized with an epoxy, thus reducing or eliminating the shrinkage. The cyclic monomer chosen for this program was 3,9-bis (5'-norbo rnene-2'yl) 1,5,7,11-tetraoxaspiro 5,5 undecane which showed the most promise in preliminary studies. The objectives of this program are to evaluate the effects of incorporating limited percentages of the bisspiro orthocarbonate in epoxy resins; to determine the improvements in subscale composite motor cases using a bisspiro/epoxy resin, and to determine the merit of fabricating pressure bottles. SURFACE CHEMISTRY AND STRUCTURAL EFFECTS IN THE STRESS CORROSION OF GLASS AND CERAMIC MATERIALS
Final Report, Jan. 1982 - Jan. 1986
Carlo G. Pantano and John J. Mecholsky 31 Mar. 1986 202 p
(Grant AF-AFOSR-0013-82)
(AD-A170243; AFOSR-86-0502TR) Avail: NTIS HC A10/MF A01 CSCL 11/2

The fracture behavior of glasses in the system $Na_2O.xAl_2O_3.(3-x)SiO_2$ (x=0.0, 0.2, 0.4, 0.6, 0.8 and 1.0) has been evaluated, and independently, their chemical corrosion in aqueous solutions was studied. The changes imposed upon the Al_2O_3/SiO_2 ratio, were intended to influence the network structure of the glass. The V-K sub I diagrams were obtained using the constant moment double cantilever beam technique in a wide variety of environments. The n-parameter in Region I was found to be independent of pH, whereas the presence of velocity plateaus and thresholds was shown to be very dependent upon the composition of the aqueous environment. This behavior was attributed to interactions between the fracture surfaces behind the crack-tip. The dependence of the n-parameter upon the bulk composition and structure of the glass was correlated with the elastic properties of the glass; i.e., the value of the n-parameter did not depend directly upon the corresponding corrosion resistance of the glass. Finally, the static fatigue limit, at least in the case of the $Na_2O.3SiO_2$ (x=0.0) glass, could be explained in terms of crack-healing rather than crack-blunting. Although, this study of fracture within a systematic compositional series of glasses led to critical assessments of the existing models for environment-dependent crack growth in glass. The results of comparable-although less extensive-studies on fluorozirconate glasses and silica sol/gel materials are also reported. GRA

RAMAN DETERMINATION OF MOLECULAR STRUCTURE AND PHYSICAL PROPERTIES OF DIELECTRIC COATINGS
G. J. Exarhos Mar. 1986 27 p Presented at the International Conference on Metallurgical Coatings, San Diego, Calif., 7 Apr. 1986
(Contract DE-AC06-76RL-01830)
(DE86-011620; PNL-SA-13846; CONF-860495-8) Avail: NTIS HC A03/MF A01

Single and multilayer coatings exhibit optical properties controlled by localized chemical bonding and inherent microstructure that result from a particular deposition technique. The application of Raman spectroscopy to characterize such materials is attractive in that it is one of the few available methods that directly probes the chemical bond. Furthermore, optical properties of the coating can advantageously be used to enhance the sensitivity of the Raman probe through interference and resonance phenomena as well as guided wave enhancement techniques. Polycrystallite grain size and extent of grain orientation can also be determined from the spectra. In addition, inherent compressional stress in coatings, manifested in vibrational line shifts, may be quantified; conversely, knowledge of the vibrational frequency dependence on applied pressure will allow an estimate of the coating elastic properties. The capability for real-time in situ analysis represents a major strength of the Raman technique. Examples are discussed detailing real-time microstructural changes in oxidic coatings subjected to temperature fluctuations or high-energy pulsed laser irradiation. DOE

METHOD FOR PRODUCING A THIN POLYIMIDE FILM ON A SILICON SUBSTRATE
S. A. Lee Apr. 1983 16 p
(BAe-BT-14610; LR48386; ETN-86-97965) Avail: NTIS HC A02/MF A01

The techniques used to produce a 50 micron polyimide film on a 3 in. silicon slice are described. An even layer of polyimide powder was deposited onto a slice as a slurry containing a volatile carrier liquid. After evaporation of this liquid, the slice was placed in a vacuum oven to partially cure the polyimide. To level the polymer (now a viscous liquid) the slice was sandwiched between two optically flat glass plates with a 50 micron steel shim positioned between the slice and glass to regulate the thickness of the completed polymer film. However, the layers are highly stressed and unstable, making them unsuitable for large scale integrated circuits. ESA

HIGH-PURITY, FINE-PARTICLE BORON NITRIDE POWDER SYNTHESIS AT -75 TO 750C, REPORT OF INVESTIGATIONS
R. S. Kalyoncu 1986 16 p
(PB86-217940; BM-RI-9012; LC-85-600346) Avail: NTIS HC A02/MF A01 CSCL 11B

Nonoxide ceramics with improved high-temperature properties could substitute for high-temperature alloys and reduce the Nation's dependence on imports of Cr, Co, Ni, and Mn. To meet the objective, the Bureau of Mines conducted research to synthesize ultrafine reactive boron nitride (BN) powders. BN powders were prepared at temperatures ranging from -75 degrees to 750 degrees C. Low temperature reactions (-75 degrees to 200 degrees C) between boron halides and N compounds led to formation of elemento-organic compounds that were thermally decomposed to ultrafine (approximately 100- to 150-A particle size) reactive BN powders. BN powders were also prepared through the reaction of a low-melting inorganic B compound (boric acid, borax) with an organic N compound (carbimide and thiocarbimide) in N2 and/or ammonia (NH3) atmospheres at temperature between 500 degrees and 750 degrees C. CORROSION RESISTANCE OF SELECTED CERAMIC MATERIALS TO SULFURIC ACID, REPORT OF INVESTIGATIONS
J. P. Bennett 1986 18 p
(PB86-212354; BM-RI-9011; LC-85-600348) Avail: NTIS HC A02/MF A01 CSCL 11B

The Bureau of Mines is investigating the acid resistance of ceramic materials to identify construction materials for emerging technology in chemical and metallurgical processes. Eight commercial ceramic materials were evaluated: two red shale, two fireclay, one silicon carbide, one silica, one carbon, and one high-alumina. Samples were exposed to 10 wt pct H2SO4 at 50 degrees C and 10, 30, 50, 70, and 90 wt pct H2SO4 at 90 degrees C for time periods of 110 days. Statistically significant changes in cold crushing strength were observed in the silicon carbide and carbon materials. Weight changes and the leach rate of Al, Ga, Fe, K, Mg, Na, Si, and Ti were also monitored. The most severe corrosion conditions were also monitored. The most severe corrosion conditions were at 90 degrees C and 30 to 50 wt pct H2SO4 for the acid proof and at 10 wt pct H2SO4 for the acid-resistant materials. The silica and the high-aluminum materials were the most acid-resistant, followed by the higher density red shale and fire clay. GRA

ANTIMISTING KEROSENE: EVALUATION OF LOW TEMPERATURE PERFORMANCE Final Report, Mar. 1983 - Dec. 198
P. Parikh, A. Yavrouian, R. Petersen, and V. Sarohia Aug. 198
49 p
(Contract DTFA3-80-A-00215)
(DOT/FAA/CT-85/31) Avail: NTIS HC A03/MF A01

The low temperature and freezing behavior of Jet A and AMK fuels was investigated in a 50-gallon capacity wing tank simulator. The fuel in the rectangular simulator was chilled from the top and bottom surfaces while the sides were thermally insulated. The evolution of a vertical temperature profile in the simulator was studied for Jet A and AMK fuels under nearly identical bottom wall temperature histories. A small but noticeable difference between the bulk fuel thermal response of Jet A and AMK was observed with a slower response for AMK. Holdup measurements for AMK were slightly lower than those for Jet A. Rocking of the simulated wing tank did not significantly alter the cool down and freezing behavior. The performance of two boost pumps: one for the DC-10 and the other for the Cessna 441 aircraft, was evaluated with AMK fuel. For both pumps the performance deteriorated when switching from Jet A to AMK. This performance deterioration was far more dramatic for the Cessna 441 boost pump than for the DC-10 boost pump. At low temperature (-30 C) the performance of the DC-10 pump actually improved compared to ambient temperature (20 C) performance. It deteriorated, however, for the Cessna 441 pump. Author

HIGH PERFORMANCE LIQUID CHROMATOGRAPHY OF PROPELLANTS. PART 1: ANALYSIS OF M1, M6, AND M10 PROPELLANTS
Jerome Haberman May 1986 20 p
(AD-A168206; ARAED-TR-86017-Pt-1) Avail: NTIS HC A02/MF A01 CSCL 07/4

The stabilizer content of propellants in the Army stockpile is periodically determined to monitor their remaining safe life. The available standard methods of analysis are time consuming, and there is evidence that they may give misleading information. These methods are being replaced by state-of-the-art, high performance liquid chromatography (HPLC) using reverse phase columns. High performance liquid chromatography permits the differentiation among the stabilizers and their degradation products together with accurate quantitation. This progress report describes work carried out in the analysis of single base propellants containing diphenylamine (DPA) as the stabilizer. Several degradation products have been identified and the routine determination of these compounds is feasible. The degradation of DPA seems to follow a pattern that is unique for M1 and M6's as compared to the pattern for M10's. It is postulated that the ingredients of the propellants, other than the nitrocellulose (NC), may influence the way in which the DPA degradation products are formed. GRA

F100 FUEL SAMPLING ANALYSIS: FOREIGN SAMPLES Final Report, Apr. 1984 - Apr. 1985
Lourdes O. Maurice Mar. 1986 115 p
(AD-A168573; AFWAL-TR-85-2087) Avail: NTIS HC A06/MF A01 CSCL 21/4

Fuel pump cavitator problems experienced with the F100 engine used in the F-15/F-16 aircraft have led to an extensive fuel analysis program to identify properties that might be contributing to fuel

pump failure. This report analyzes the chemical and physical properties of 12 JP-4 and 4 JP-8 fuel samples obtained from Foreign National Air Bases. The fuels analyzed met specifications in all but a few isolated cases, and had no unusual properties. If the fuel is causing fuel pump failure, it must be the result of a property not being measured. The fuels are as good or better than their specifications prescribed. It is concluded that the F100 fuel pump cavitation problems are most likely associated with the mechanical complexity built into the design, rather than the results of the fuel used. GRA

STUDIES ON THE DYNAMIC MECHANICAL PROPERTIES OF THE COMPOSITE MODIFIED DOUBLE-BASE PROPELLANT
Zhou Zhou, Zhanning Jia, and Qihuai Zhou 29 May 1986 23 p Transl. into ENGLISH from Binggong Xuebaa (China), v. 2, no. 2, May 1985 p 49-58
(AD-A168799; FTD-ID(RS)T-0328-86) Avail: NTIS HC A02/MF A01 CSCL 21/9

The dynamic mechanical properties of the composite modified double-base (CMDB), double-base (DB) and polyvinyl chloride (PVC) composite propellants were measured respectively with a Rheovibron viscoelastometer. The effects of three kinds of solid fillers (aluminium (Al), ammonium perchlorate (AP) and cyclotetraethylenetetranitramine (HMX)) and the different kinds and contents of plasticizers (triacetin (TA), ortho-dibutyl phthalate (DBP) and nitroglycerine (NG)) on the dynamic mechanical properties of the double-base binder were studied. The dynamic mechanical data and spectrums on these ingredients have been obtained at a fixed frequency (3Hz) and a broad range of temperature. At the same time, the impact strengths of the CMDB propellant, the double-base binder and the pvc propellant were also measured at a broad range of temperature. Experimental conclusions have been obtained that the dynamical mechanical properties of the CMDB propellant lie between the DB and PVC composite propellants and depend on its binder system, and that the CMDB propellant has the specific properties of both higher mechanical damping and a strong Beta relaxation at low temperature. GRA

NUMERICAL ROUTINES FOR PREDICTING IGNITION IN PYROTECHNIC DEVICES
K. G. Pierce Jun. 1986 111 p
(Contract DE-AC04-76DP-00789)
(DE86-013251; SAND-86-1268) Avail: NTIS HC A06/MF A01

Two numerical models of the thermal processes leading to ignition in a pyrotechnic device have been developed. These models are based on finite difference approximations to the heat diffusion equation, with temperature-dependent thermal properties, in a single spatial coordinate. The derivation of the finite difference equations is discussed and the methods employed at boundaries and interfaces are given. The sources of the thermal-properties data are identified and how these data are used is explained. The program structure is explained and example runs of the programs are given. DOE

CRITERIA FOR ASPHALT-RUBBER CONCRETE IN CIVIL AIRPORT PAVEMENTS: MIXTURE DESIGN Final Report, Sep. 1983 - Aug. 1986
Freddy L. Roberts, Robert L. Lytton, and Denise Hoyt Jul. 1986 74 p
(Contract DTFA01-83-C-30076)
(DOT/FAA/PM-86/39) Avail: NTIS HC A04/MF A01

A mixture design procedure is developed to allow the use of asphalt-rubber binders in concrete for flexible airport pavement. The asphalt-rubber is produced by reacting asphalt with ground, scrap tire rubber to produce the binder for the asphalt-rubber concrete. Procedures for laboratory preparation of alsphalt-rubber binders using r . equipment setup that was found by researchers to produce laboratory binders with similar properties to field processes are included. The rubber-asphalt concrete mixture design

procedure includes adjustments to the aggregate gradation to permit space for the rubber particles in the asphalt-rubber binder as well as suggested mixing and compaction temperatures, and compaction efforts. While the procedure was used in the laboratory to successfully produce asphalt-rubber concrete mixtures, it should be evaluated in the field to ensure that consistent results can be achieved in a production environment. DERIVATION OF DAMAGE FUNCTIONS FOR ATMOSPHERIC DEGRADATION OF MATERIALS
F. H. Haynie and F. W. Lipfert May 1986 21 p
(PB86-213238; EPA-600/D-86-118) Avail: NTIS HC A02/MF A01 CSCL 13B

The information in the paper is directed to those who develop and use damage functions which relate atmospheric degradation of materials to various causal agents in the atmosphere. Such relationships must be quantified mathematically as part of the overall cost-benefit considerations associated with possible pollution control strategies. Damage functions may be derived from theoretical considerations, from controlled experiments in environmental simulation chambers, from essentially uncontrolled field experiments, or from semicontrolled field experiments. The paper discusses optimum ways of combining these methods to improve the credibility and applicability of materials damage functions for use in assessments, with reference to some of the research performed for the National Acid Precipitation Assessment Program. NATIONAL FORUM ON THE FUTURE OF AUTOMATED MATERIALS PROCESSING IN US INDUSTRY: THE ROLE OF SENSORS. REPORT OF A WORKSHOP (1ST) HELD AT SANTA BARBARA, CALIFORNIA ON DECEMBER 16-17, 1985
H. T. Yolken and R. Mehrabian Dec. 1985 79 p Workshop held in Santa Barbara, Calif. 16-17 Dec. 1985 Prepared in cooperation with California Univ., Santa Barbara
(PB86-212040; NBSIR-86-3341) Avail: NTIS HC A05/MF A01 CSCL 13H

These are the proceedings of the workshop A National Forum on the Future of Automated Materials Processing in U.S. Industry - The Role of Sensors. This is the first of two workshops to be sponsored by the Industrial Research Institute and the White House Office of Science and Technology Policy, Committee on Materials Working Group on Automation of Materials Processing. The second workshop will address the other two key components required for automated materials processing, process models and artificial intelligence coupled with computer integration of the system. The objective of these workshops is to identify and assess important issues afecting the competitive position of U.S. industry related to its ability to automate production processes for basic and advanced materials and to develop approaches for improved capability through cooperative R&D and associated efforts. ELECTROMAGNETIC BACKSCATTERING BY CORNER REFLECTORS Semiannual Report, 1 Feb. - 31 Jul. 1986
Constantine A. Balanis and Timothy Griesser 1986 30 p
(Grant NAG1-562)
(NASA-CR-179846; NAS 1.26:179846) Avail: NTIS HC A03/MF A01 CSCL 20N

The analysis of the backscatter cross section of a dihedral corner reflector, using Geometrical Theory of Diffraction (GTD) and Physical Theory of Diffraction (PTD), is completed in the azimuthal plane, and very good agreement with experimental results is obtained. The advantages and limitations of the GTD and PTD techniques are discussed specifically for radar cross section applications. The utilization of GTD and PTD in oblique incidence diffraction from conducting targets is discussed. Results for equivalent current off-axis diffraction from the flat rectangular plate are presented using the equivalent currents of Knott, Senior, and Michaeli. The rectangular subdivision technique of Sikta, and its extension by Sunatara, alleviate some of the limitations of the equivalent techniques. As yet, neither technique can be used in bistatic scattering or for multiple scattering of a complex target. Author

ELECTROMAGNETIC BACKSCATTERING BY CORNER REFLECTORS Semiannual Report, 1 Aug. 1985 - 31 Jan. 1986
Constantine A. Balanis and Timothy Griesser 1986 158 p
(Grant NAG1-562)
(NASA-CR-179809; NAS 1.26:179809) Avail: NTIS HC A08/MF A01 CSCL 20N

The Geometrical Theory of Diffraction (GTD), which supplements Geometric Optics (GO), and the Physical Theory of Diffraction (PTD), which supplements Physical Optics (PO), are used to predict the backscatter cross sections of dihedral corner reflectors which have right, obtuse, or acute included angles. These theories allow individual backscattering mechanisms of the dihedral corner reflectors to be identified and provide good agreement with experimental results in the azimuthal plane. The advantages and disadvantages of the geometrical and physical theories are discussed in terms of their accuracy, usefulness, and complexity. Numerous comparisons of analytical results with experimental data are presented. While physical optics alone is more accurate and more useful than geometrical optics alone, the combination of geometrical optics and geometrical diffraction seems to out perform physical optics and physical diffraction when compared with experimental data, especially for acute angle dihedral corner reflectors. US LONG DISTANCE FIBER OPTIC NETWORKS: TECHNOLOGY, EVOLUTION AND ADVANCED CONCEPTS. VOLUME 3: ADVANCED NETWORKS AND ECONOMICS Final Report
Oct. 1986 598 p
(Contract NAS3-24682)
(NASA-CR-179481; NAS 1.26:179481) Avail: NTIS HC A25/MF A01 CSCL 17B

This study projects until 2000 the evolution of long distance fiber optic networks in the U.S. Volume 1 is the executive Summary. Volume 2 focuses on fiber optic components and systems that are directly related to the operation of long-haul networks. Optimistic, pessimistic and most likely scenarios of technology development are presented. The activities of national and regional companies implementing fiber long haul networks are also highlighted, along with an analysis of the market and regulatory forces affecting network evolution. Volume 3 presents advanced fiber optic network concept definitions. Inter-LATA traffic is quantified and forms the basis for the construction of 11-, 15-, 17-, and 23-node networks. Using the technology projections from Volume 2, a financial model identifies cost drivers and determines circuit mile costs between any two LATAs. A comparison of fiber optics with alternative transmission concludes the report. Author

HF (HIGH FREQUENCY) ABSOLUTE TIME OF ARRIVAL SENSING Interim Report, Sep. 1981 - May 1985
R. B. Rose Feb. 1986 118 p
(AD-A168275; NOSC/TD-869) Avail: NTIS HC A06/MF A01 CSCL 17/7

In late 1980 questions arose concerning whether the ionosphere was sufficiently stable to allow precisely measured time of arrival of skywave signals to be used for geolocation in the high frequency (HF) band between 2 and 32 MHz. The chief limitation in the accuracy of this typo of system is the amount of uncertainty in the ionospheric height estimation and its temporal stability. Traditional ionospheric research resources did not address the issue in sufficient detail and time resolution to be of any assistance. In order to understand the exact nature of the ionospheric uncertainties and to quantify their extent, experimentation was proposed to sense the variation in the refraction height of the ionosphere as it relates to the time of arrival of the HF signal. The objective of this work was to determine the range of environmentally induced errors in a skywave Time Difference of Arrival (TDOA) measurement, thereby bounding the ultimate geolocation accuracy one could expect from this technique. The first experimental measurement system started operation in early 1981. This effort involved establishing a continuous absolute Time of Arrival (TOA) experiment over the one-hop midlatitude path between San Diego, California and Fort Collins, Colorado. The system is fully digital and stabilized with a cesium beam standard. This work was supplemented with vertical incidence sounder data at both ends of the path, a collateral Doppler sensing system, and coincident satellite solar data. GRA

RAIN EFFECTS ON RADIO FREQUENCY PROPAGATION Final Report, 31 Sep. 1985 - 31 Mar. 1986
D. J. Fang and C. S. Lo 31 Mar. 1986 108 p
(Contract F04704-85-C-0144)
(AD-A168342; MTL-WD-8604-T; BMO-TR-86-23) Avail: NTIS HC A06/MF A01 CSCL 20/14

Rain is a principal cause of signal degradation in a terrestrial or satellite transmission in a frequency range from UHF to EHF. This study proceeded with a format for compiling and editing the relevant data, and for making engineering inferences to supplement relevant yet inadequate data, as required for practical applications on a terrestrial or a slant path link. The format was to model the rain-induced attenuation by an empirical relationship on a = aRb L type of power law equation. Five well recognized models (CCIR, Fedi, French, Lin and SAM) were chosen for comparison with database. As for immediate applications, the Lin model is recommended for percentage of time over 0.35 of a year; and for percentage of time less than 0.3%, the French model is considered to be applicable. For more specific applications, such as for cases of low rain-rate regions to high rain-rate regions, low elevation angle paths to high elevation angle paths, etc., best performance models are identified. GRA

SURFACE-SEARCH RADAR PERFORMANCE IN THE EVAPORATION DUCT: GLOBAL PREDICTIONS, REVISION A Final Report, Oct. 1982 - Oct. 1983
K. D. Anderson May 1986 80 p Original contains color illustrations
(AD-A168631; NOSC/TR-923-Rev-A) Avail: NTIS HC A05/MF A01 CSCL 17/9

Surface-search radar systems, if properly designed, may utilize the oceanic surface evaporation duct to detect surface targets at ranges greater than 60 nmi. Theoretical relationships between the thickness of the evaporation duct and maximum detection range are derived for four radars at frequencies of 3, 6, 10, and 18 GHz. Distributions of maximum detection range are calculated from two worldwide duct height climatologies. The analysis considers four targets with three possible radar cross section distributions applied to each target. Since rigorous full mode waveguide analysis of all combinations is impractical, the propagation characteristics are approximated using two single mode techniques. GRA

A CLASS OF STABLE TRANSMISSION ALGORITHMS FOR VARYING USER MODELS
Michael Paterakis, Leonidas Georgiadis, and P. Papantoni-Kazakos Apr. 1986 29 p

(Contract N00014-85-K-0547; NSF ECS-85-06916)
(AD-A168701; UCT/DEECS/TR-86-7) Avail: NTIS HC A03/MF A01 CSCL 17/2

We consider a broadcast packet radio network with independent and identical users (LID). We require that the time of the transmission channel be slotted, and that transmissions be then synchronous (each packet transmission may only start at the beginning of some slot). We assume ternary feedback per slot (empty versus success versus collision), full feedback sensing by each user, no propagation delays and also that collision results in full destruction of all the involved packets; thus retransmission is then necessary. This report proposed and analyzes a class of stable transmission algorithms whose operation is independent of the number of users in the system and the arrival process per user, as long as the latter is IID. The algorithms in the class are a combination of a random access and reservation techniques. They are synchronous, and they are studied in the full sensing broadcast environment. For any finite number of independent users in the system, and any IID arrival process per user, their throughput is one. Given some IID arrival process per user, given some algorithm in the class, its limit throughput, when user population tends to infinity, is lowered bounded by its limit throughput in the presence of the limit Poisson user model. The latter throughput is also attainable; it coincides with the limit throughput, when the users are Poisson. GRA

AN EQUATORIAL SCINTILLATION MODEL Technical Report, 1 Feb. 1983 - 30 Apr. 1985
Edward J. Fremouw and Robert E. Robins 30 Sep. 1985 75 p
(Contract DNA001-83-C-0097; DNA Proj. I25-AMXI)
(AD-A168723; PD-NW-85-342R; DNA-TR-85-333) Avail: NTIS HC A04/MF A01 CSCL 04/1

Radiowave scintillation in the presence of natural and/or high altitude nuclear disturbances has the potential to disrupt numerous transionospheric radio and radar systems. This report develops a model characterizing the plasma density irregularities that produce scintillation in the naturally disturbed equatorial F layer. The model has been incorporated into Program WBMOD along with subroutines for computing both link geometry and scintillation indices, the latter by means of phase screen diffraction theory. The model is based on similarly extensive analysis of Wideband data from two equatorial stations. It describes irregularities at an effective height of 350 km that are isotropic across the geomagnetic field and elongated by a factor of 50 along the field and whose one dimensional spatial power spectrum obeys a single regime power law with a (negative) spectral index of 1.5. The height-integrated spectral strength of the irregularities is modeled as a function of solar epoch (sunspot number), the angle between the sunset terminator and the geomagnetic field line through the equatorial F layer point in question (a measure of seasonal and longitudinal variation), time after E-layer sunset on that field line, and the F-layer magnetic apex latitude of the point. The report also highlights a factor missing from complete characterization of the joint seasonal/longitudinal variation of scintillation, thought to depend upon thermospheric neutral winds. GRA

A MEASURE OF THE RANDOMNESS OF SIGNALS AND SUGGESTED APPLICATIONS
B. Reiffen 7 Mar. 1986 39 p
(Contract F19628-85-C-0002)
(AD-A168916; TR-750; ESD-TR-86-030) Avail: NTIS HC A03/MF A01 CSCL 09/3

The solution to an optimization or estimation problem depends on some criterion of optimality. Typically, all prospective solutions have an associated measure of goodness, and the optimum solution is that with maximum (or minimum) measure. The choice of measure incorporates whatever is known about the physics of the problem as well as other assumptions. This presentation suggests two closely related measures of the randomness of signals. Each of these measures is related to the uncertainty principle of quantum mechanics. It is further suggested that minimizing either of these measures is an appropriate criterion for the solution of a variety of problems, including spectral estimation, signal extrapolation and/or interpolation, nonparametric signal detection, and phase retrieval. The criterion may be appropriate when the unknown signal is postulated to be simple rather than complex and it is necessary to minimize the number of arbitrary assumptions made about the signal and noise characteristics. ON NONGAUSSIAN SIGNAL DETECTION AND CHANNEL CAPACITY
Charles R. Baker Aug. 1985 21 p
(Contracts N00014-81-K-0373; N00014-75-C-04491)
(AD-A170239) Avail: NTIS HC A02/MF A01 CSCL 09/4

A summary of recent research results is given. Three problems are discussed: detection of nonGaussian signals in Gaussian noise, signal detection in nonGaussian spherically-invariant noise, and information capacity of communication channels when the constraint on the transmitted signal is mismatched to the Gaussian channel noise. COMPUTER PROGRAM FOR FREQUENCY ASSIGNMENTS TO AERONAUTICAL AND MARITIME BEACONS AND COAST STATIONS IN THE BAND 283.5 TO 1800 kHz
Lars Bergman Feb. 1986 40 p
(FOA-C-60018-E2; ISSN-0281-0255; ETN-86-97865) Avail: NTIS HC A03/MF A01

A computer program created for frequency assignments to aeronautical radio beacons and to beacons in the maritime radionavigation service, but which can also be used for frequency planning in the maritime mobile service is described. Ground wave propagation calculations based on the curves in CCIR Rec 368 are made for propagation over land and sea. Using these results with map studies, manual estimations concerning mixed path propagation can be done. Sky wave propagation is calculated using the curves in CCIR Rec 435-4 for 50 deg geomagnetic latitude in the Northern Hemisphere and for 30 deg in the southern. It is estimated that the necessary accuracy, including the data of the effective radiated power of the transmitters, is not high enough for a more sophisticated method of calculation, including a record of coastlines, so the program was originally not made for automatic frequency assignments. An automatic mode was added, but should be used with caution. ESA

METEOSAT RAW IMAGE DATA ENCRYPTION Final Report
H. P. Bader, R. Rueppel, A. Bricard, and M. Lepertel Paris ESA Nov. 1985 120 p Prepared in cooperation with Societe Crouzet (Contract ESTEC-5815/84-NL-BI(SC))
(ESA-CR(P)-2234; ETN-86-98113) Avail: NTIS HC A06/MF A01

A stream cypher system is proposed for METEOSAT raw image data encryption. For each transmitted bit the stream cypher generates a key stream bit. This key steam bit is EXORED with the message bit before it is transmitted. The receiver does the same with the received encrypted cypher text bit and gets back the clear text message bit. Since the METEOSAT raw image transmission system already includes a sophisticated bit and line synchronization system, it is proposed that this be used also for cypher synchronization. Onboard and ground implementation, and key management, are described. ESA

DATA LINK ISOLATER
J. D. Schipper 1986 14 p In DUTCH
(DIGEL-52; ETN-86-98157) Avail: NTIS HC A02/MF A01

A module which isolates the common-mode signals between input and output was developed. The isolation is required because the zero level in two separated systems which are situated at a distance from each other is never the same. The module consists of two parts connected by optocouplers; one part is fully isolated from the Earth; both parts consist of a line receiver, a line driver, and a power supply. The maximum voltage between input and output of the optocouplers is 1000 V. The maximum bit rate of the module is 5 MB/s. The link via this module fulfils the RS422 standard and is fully duplex. ESA

COMPARISONS OF THE TWO-STATE MARKOV AND FRITCHMAN MODELS AS APPLIED TO BIT ERROR STATISTICS IN COMMUNICATION CHANNELS
L. E. Vogler May 1986 30 p Sponsored by RADC
(PB86-213485; NTIA-R-86-193) Avail: NTIS HC A03/MF A01 CSCL 17B

Comparisons of Fritchman's single-error-state model with the two-state Markov model are presented in graphical form for a number of statistical functions, e.g., the error gap distribution (EGD), the block error probability (BLER), and the probability of undetected block error (PUB). Measured data from previously published papers are shown on the curves where these are available, and examples of four types of channels are illustrated: HF, troposcatter, VHF, and switched network. A simple data-fitting procedure is described for the EGD, and its relationships to other statistics of interest are given. GRA

GRIDNET: A HIGHLY SURVIVABLE DIGITAL COMMUNICATIONS NETWORK, PHASE 1 Final Report
A. Mink, G. G Nacht, A. L. Koenig, and A. W. Holt Apr. 1986 33 p Sponsored by Defense Nuclear Agency
(PB86-203015; NBSIR-86-3361) Avail: NTIS HC A03/MF A01 CSCL 17B

GRIDNET is a highly reliable and survivable packet switched, wide area communication network that may consist of thousands of modes and may span thousands of miles. The reliability of GRIDNET is based on redundant transmission of data via two distinct paths and bitwise comparison of the duplicate received data in addition to error detection codes. The survivability of GRIDNET is attributed to its intrinsic topology, which provides for a number of alternative paths between pairs of nodes. A feasibility prototype of a GRIDNET was proposed as a multi-phase research project. The report describes the design of the phase 1 GRIDNET prototype which was constructed. This prototype satisfied all of the Phase 1 operational performance objectives. GRA

An EHF Telecommunication System Engineering Model (ETSEM) has been developed as an aid in the design of line-of-sight (LOS) communication systems from 10 to 100 GHz. ETSEM provides tabulation of path geometry parameters and analyzes ray-path and Fresnel zone clearances to help the engineer design the path. ETSEM also predicts the performance (availability) of both digital and analog systems based on state-of-the-art EHF propagation models and equipment specifications. Attenuation by rain, clear-air absorption, and multipath are modeled. These are expected to essentially determine the statistics of link availability as limited by propagation impairments. Performance may be predicted for any interval of months of the year. A climatological data base for North America and Europe provides parameters for the propagation models. ETSEM has been implemented on a

desk-top computer. Weaknesses and limitations of the model are discussed and improvements are suggested. GRA

RF FIELD PROFILES IN WEAKLY IRREGULAR OPEN RESONATORS
J. J. Barroso, A. Montes, and G. O. Ludwig Jul. 1986 63 p Submitted for publication
(INPE-3957-PRE/975) Avail: NTIS HC A04/MF A01

Open resonators are considered with longitudinal profiles described by continuous and sufficiently smooth functions in order to reduce reflections and mode conversion in the cavity. For these types of resonators, it is shown that the single mode approximation is adequate. Using a Langer transformation, the approximate solution for problems with two turning points is given in terms of a uniform expansion valid for all axial positions; for the fundamental mode, the RF field longitudinal distribution is essentially of the form exp [-w sup 2 (z)/2] where w(z) is determined by the resonator profile. A comparative study of the resonant and selective properties for different resonator types is made, and the influence of the cavity profile on the electric field longitudinal distribution is analyzed. As an example of practical interest, the design of a resonant cavity for a 35Ghz gyrotron operating in the TE sub 021 mode is presented. Author

A planar cathode, Pierce type electron gun with a design perveance of .0000032 (amps/volts to the 3/2 power) has been operated with a lanthanum hexaboride (LaB6) cathode. The cathode (useful diameter 1.9 cm) is heated by bombardment by electrons from a small tungsten filament. The bombardment heating system is stabilized by a feedback control circuit. The power required to heat the cathode is 315 W bombardment power and 200 W filament power. Heating power has been reduced by careful heat shielding and reduction of heat conduction losses. Significant additional reductions should be possible. The sintered LaB6 cathode disk is 2.5 cm in diameter, 3.2 mm thick, and has a density of 94%. No problems have been encountered with cracking of the disk. Cathode emission is insensitive to repeated exposure to air after allowing the cathode to fully cool. The measured perveance and anode transmission of the gun are 3.2x10(-6) and 94%, respectively. Current densities up to 6.5 A/sq cm have been reached with 5 micrometer pulses. Measurements were made at cathode temperatures of 1300 to 1600 C. GRA

RADON OPTICAL PROCESSING IN RADON SPACE Final Report, Jul. 1984 - Jan. 1986
Harrison H. Barrett 15 Jun. 1986 166 p
(Grant AF-AFOSR-0188-84)
(AD-A169612) Avail: NTIS HC A08/MF A01 CSCL 09/3

The stated goals of the Radon program were: (1) Theoretical investigation of the role of the Radon transform in signal processing, including enumeration of the operations achievable in Radon space. (2) Construction of a practical system for two dimensional spectral analysis and image filtering. (3) Proof-of-principle experiments for other processing operations, such as bandwidth compression and calculation of the Wigner distribution function. (4) Determination of the feasibility of Radon-space processing of three dimensional data, emphasizing not only system architecture but also storage media capable of saving rapidly retrieving the requisite data arrays. Several 2D signal-processing operations are discovered susceptible to solution in Radon space. These include the Hartley transform, certain joint coordinate-frequency representations (e.g., the Wigner distribution function and Woodward ambiguity functions), certain algorithms for spectrum estimation (e.g., the periodogram and the Yule Walker autoregressive model), and the cepstrum. Most of these Radon space operations have been demonstrated in computer simulations and some have been performed by means of analog hardware in the hybrid Radon space signal processing system. This system can perform a family of processing operations at about five frames per second, limited by the image-rotation rate. Processing is performed by surface acoustic wave (SAW) filters, and the 2D processed signal is displayed on a CRT. GRA

ELECTROCHEMICAL INVESTIGATION OF LITHIUM/POTASSIUM CARBONATE EUTECTIC FOR APPLICATION IN MODELING THE MOLTEN CARBONATE FUEL CELL CATHODE Final Progress Report
L. McCoy and M. Schuman Apr. 1986 97 p
(Contract DE-AC21-84MC-21185)
(DE86-001087; DOE/MC-21185/2042) Avail: NTIS HC A05/MF A01

A program involving the design, construction, and operation of a high-temperature cell equipped with a rotating gold disk electrode has been carried out with the objective of identifying and quantifying the principal oxide species present in molten LiKCO3 electrolytes using electrochemical measurements. The dependence of the current on electrode rotational speed at 750 to 800 C indicates that the data are typical of the convective/diffusive transport of an electroactive species from the bulk electrolyte. The reverse is true at 650 C, where the current increases with an increasing voltage sweep rate but is little affected by the speed of electrode rotation. In the latter case, a current by chemical reaction occurring within the electrode boundary layer is indicated. The linear current-voltage increase observed at the lower temperature in the presence of about 20 mol % 02 has not been accounted for. Graphical analysis of the data taken with air and CO2 sparged electrolyte at 750 and 800°C indicates the electroactive species to be the superoxide ion. Computer studies of the same data usi ng regression analysis methodology indicate that the current may instead arise from the reduction of the peroxide ion concurrently with other electroactive material derived from secondary catalytic reactions or electrolyte impurities. Additional data will be required to support either conclusion with certainty. Detailed studies of the electrochemistry of the LiKCO3 electrolyte over a broader range of temperatures and sparge gas compositions are recommended as a means of providing a second basis for identifying the electrode reactions. HIGH-EFFICIENCY, THIN-FILM, CADMIUM CHALOCOGENIDE PHOTOELECTROCHEMICAL CELL WITH IN SITU STORAGE Final Subcontract Report, 1 May 1983 - 31 Mar. 1985
J. Manassen, S. Licht, G. Hodes, D. Cahen, and M. Lev Apr. 1986 97 p
(Contract DE-AC02-83CH-10093)
(DE86-004451; SERI/STR-211-2909) Avail: NTIS HC A05/MF A01

A photoelectrochemical cell with in situ storage, based on a Cd(Se,Te) photoelectrode in a polysulfide solution, was constructed. The counter-electrode was cobalt sulfide on brass and the membrane Permion 1010. A reproducible plating method, suitable for a 20-cm² area, was developed, giving a maximum power of 200 mA. Photoetching, criticality important, was done in concentrated hydrochloric acid under reverse bias. The polarization behavior of the large CoS counterelectrodes was studied; the presently used geometry of a frontwall cell gives a polarization loss of about 10%. The water transport through two kinds of membranes was found to depend on the cation in solution. Greater water transport was found with potassium ion than with sodium ion in the electrolyte. A technical version of the cell with in situ storage was produced with the membrane in cylindrical form. Its lower resistance improved the difference between day and night current. After working two months under real weather conditions, the photoelectrode deteriorated to half its initial output. The chemistry of polysulfide solutions was studied, revealing compositions providing maximum stability and efficiency. DOE

COMBINING AUTOMATIC TITRATION OF TOTAL IRON AND SULFUR IN THERMAL BATTERY MATERIALS
N. A. Marley 28 May 1986 35 p
(Contract DE-AC04-76DP-00656)
(DE86-007802; GEPP-TIS-962) Avail: NTIS HC A03/MF A01

Optimal thermal battery performance requires careful control of the iron disulfide content in the catholyte mixture. Previously, the iron and sulfur content of battery materials was determined separately, each requiring a lengthy sample preparation and clean up procedure. A new method has been developed which allows both determinations to be made on the same sample following a simple dissolution procedure. Sample preparation requires oxidation and dissolution with nitric acid followed by dissolution in hydrochloric acid. Iron and sulfur are then determined on sample aliquots by automatic titration. The implementation of this combined procedure for the determination of iron and sulfur by automatic titration has resulted in a substantial reduction in the analysis time. Since sample aliquots are used for each determination, the need to repeat a sample for analysis is rare, improving both the analytical efficiency and sample throughput. Results obtained for sulfur show an improved precision. DOE

STUDIES OF HIGH RELIABILITY LONG-LIFE LI/SO SUB 2 CELLS
C. D. Jaeger, S. C. Levy, J. T. Cutchen, and E. V. Thomas 1986 7 p
(Contract DE-AC04-76DP-00789)
(DE86-010478; SAND-86-0191C) Avail: NTIS HC A02/MF A01

To satisfy the need for a five year battery, a long-term test of Li/SO2 cells was initiated. Premature failures were observed and a program was undertaken to identify the cause of these failures. Based on the results of this program, changes in the cell design were made which gave rise to the Sandia modified Li/SO2 cell having improved long-life performance. Several lots of modified cells have been manufactured during the past five years. Acceptance testing of incoming cells from each lot has revealed lot-to-lot variation in performance as well as a small proportion of cells with low capacity. A program to develop a nondestructive methodol-

ogy for identifying cells with low inherent capacity was initiated. Several relevant nondestructive measurement parameters were identified. A decision tree screening technique, based on these parameters, was developed to identify those cells having low capacity. DOE

CALORIMETRIC MEASUREMENTS OF THE EQUIVALENT SERIES RESISTANCE OF LOW-LOSS, HIGH REPETITION RATE PULSE DISCHARGE CAPACITORS
G. G. McDuff and K. R. Rust 1986 6 p Presented at the 17th Power Modulator Symposium, Seattle, Wash., 23 Jun. 1986
(Contract W-7405-eng-36)
(DE86-011232; LA-UR-86-1860; CONF-860674-1) Avail: NTIS HC A02/MF A01

In high repetition rate pulsed circuits, component losses are a major design consideration. Accurate means of calculating the dissipation loss is essential for determining efficiency and in designing cooling systems for removal of associated heat. In high voltage systems, dielectric loss can be a major contributor to power dissipation. Total energy dissipation in a capacitor is the sum of dielectric, tab, corona, lead connections, and skin effect losses. Dielectric loss is also dependent on temperature, voltage, and frequency which adds to the complexity of determining an accurate value. The total loss component can be described by the equivalent series resistance or ESR. This paper reviews the most common electrical methods used to measure the ESR and particulars that must be considered with these techniques. Finally calorimetric methods of ESR determination are described that are accurate regardless of frequency and voltage and the ESR values of a variety of commercially available pulsed discharge capacitors. ALTERNATOR-DRIVEN, MAGNETICALLY SWITCHED MODULATOR
R. Kihara and H. C. Kirbie 1986 8 p Presented at the 17th Power Modulator Symposium, Seattle, Wash., 23 Jun. 1986
(Contract W-7405-eng-48)
(DE86-012189; UCRL-94757; CONF-860674-8) Avail: NTIS HC A02/MF A01

The technique of magnetically switching high-power pulses was recently revitalized with the development of amorphous magnetic alloys and the new power conditioning requirements of pulsed lasers and high-brightness particle accelerators. The most common magnetic switching technique for generating high-repetition-rate pulses consists of a dc power supply, a triggered switch (thyratron or solid-state), and a repeated network of magnetic switches and capacitors. The life of this type of pulser is limited by the aging of liquid and solid dielectric materials and by the reliability of the triggered switch. An alternator-driven, magnetically switched modulator differs from the conventional magnetic modulator in the replacement of the dc power supply and triggered switch with a high-frequency motor-generator set and an all-magnetic circuit. The power conditioning network converts each cycle of the applied ac power into a single, compressed, unipolar pulse. Consequently, the modulator produces a train of pulses with an interpulse separation equal to the period of the alternator. Additional compression can be attained by the addition of successive stages of magnetic switching. The absence of active switches within the network improves the system reliability and extends the service life of the modulator to the limits of component insulation fatigue and alternator bearing wear. This style of magnetic pulse compression was first described by Melville and reproduced at LLNL in order to quantify the network efficiency, jitter and reliability when modern magnetic materials are employed. DOE

STATISTICAL DISTRIBUTIONS OF BREAKDOWN VOLTAGES IN A HIGH CURRENT SPARK GAP
L. F. Rinehart and M. T. Buttram 1986 8 p Presented at the 17th Power Modulator Symposium, Seattle, Wash., 23 Jun. 1986
(Contract DE-AC04-76DP-00789)
(DE86-012281; SAND-86-0519C; CONF-860674-5) Avail: NTI HC A02/MF A01

We have designed and constructed a new spark gap test-be to study high current effects and to establish, experimentally, th critical current and other conditions required to generate th extreme value distribution. We are currently measuring the extrem value onset point as a function of current, gap spacing, and variou other parameters. Scanning electron microscope study of electrod surfaces after discharges above and below the extreme valu onset is being performed to correlate surface conditions wit breakdown voltage distributions. The maximum design parameter of the test-bed are 140 kV, >100kA critically damped, >200 k with ringing waveform, 14 kJ/shot, maximum available prime powe 2 MW. A unique low inductance (230 nH with 1.4 f energy storage geometry is used to generate very high current discharges wit no reversal; thus, anode-cathode effects may be studied separatel at >100 kA. Test runs of >10^4 shots are performed for each se of experimental conditions so that very low probability events ca be measured with confidence. These large statistical samples o data are recorded and analyzed by an on-line computer dat acquisition system. We present here the machine design, geometry and data showing the extreme value onset under some experimen tal conditions. DOE

ENGINEERING LIMITS OF PHOTOCONDUCTIVE SEMICONDUCTOR SWITCHES IN PULSED POWER APPLICATIONS
F. J. Zutavern and M. W. OMalley 1986 6 p Presented at th 17th Power Modulator Symposium, Seattle, Wash., 23 Jun. 1986
(Contract DE-AC04-76DP-00789)
(DE86-012282; SAND-86-0434C; CONF-860674-4) Avail: NTIS HC A02/MF A01

The potential of essentially jitter free subnanosecond rise time photoconductive semiconductor switches (PCSS) for pulsed power has been explored in several previous papers. In addition to picosecond rise time and jitter, PCSS also offers low inductance, high repetition rates (GBz), and optical control. In developing large scale PCSS for pulsed power applications, one encounters many aspects of the switch which can be selected or tailored to meet the specific requirements of each application. This paper describes PCSS in terms of the switching parameters which are being stressed to meet these requirements and discusses their theoretical limits as well as those encountered in the laboratory. Recent improvements (from 20 kV/cm to 70 kV/cm) in the surface breakdown strength of silicon wafers for high voltage PCSS are reported. Several specific examples are included to illustrate and emphasize the particular switching parameters being discussed. DOE

UTILITY-INTERACTIVE INVERTER USING THE dc CURRENT-SOURCE APPROACH
M. F. Schlecht Apr. 1986 161 p
(Contract DE-AC04-76DP-00789)
(DE86-012135; SAND-85-7019) Avail: NTIS HC A08/MF A01

A topological approach to a utility-interactive inverter that treats the photovoltaic array as a current-source, rather than as a voltage-source is presented. The different characteristics resulting from this approach have certain advantages that apply to single-phase residential units as well as to three-phase high power units. Advantages include open-loop control of the ac current waveform, an array voltage that can extend from zero up to some maximum, and the use of an inductor as the dc energy storage element. Simulations showed that the switching frequency for an active-waveshaping inverter can actually be quite low (5 kHz or less) and still obtain a distortion level in the utility current of less than 5% THD. Finally, a 20 kW three-phase current-source converter is described. DOE

MITTER AMPLIFIER FOR COMMUNICATION SATELLITES 60 GHz/10 W Final Report, Mar. 1984
Gerold Lippert, Karl-Heinz Bluhm, Peter Malzahn, and Claus Bulka Bonn, West Germany BMFT Dec. 1985 67 p In GERMAN; ENGLISH summary Sponsored by BMFT
(BMFT-FB-W-85-030; ISSN-0170-1339; ETN-86-97845) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 14

For communication between geostationary satellites a transmitter using a TWT amplifier with frequencies in the region of 60 GHz and output power of a few watts is proposed. The design objectives for the electron gun were realized using a computer program, which also takes into account the thermal velocities of the electrons, to dimension the electrodes. A focusing electrode and a mixed metal cathode with a low beam compression ratio are employed in the gun. All requirements for the beam focusing system are met using an extremely precise machined integrated PPM system and SmCo5 magnets. An easily manufacturable delay line structure was realized using a diffusion brazed interdigital line consisting of only a few parts. The one stage collector can operate with a strongly reduced potential. ESA

STATIC SERIES VOLTAGE MARGIN OF I2L [STATISCHE SERIESPANNINGEN MARGE VAN I2L]
J. vanderPlas May 1985 17 p In DUTCH
(Rept-85SO; ETN-86-98041) Avail: NTIS HC A02/MF A01

The static series voltage margins of logic circuits were calculated using a flip-flop circuit with two one-collector I2L transistors and a stability criterion. The static series voltage margin was calculated for the one-sided (one perturbation source) as well as for the worst case two-sided (two cooperating current sources) using several methods. Both cases show the same results for the margin. The calculation using voltage equations provides the best results. Approximations had to be made since the exact calculation is too difficult. ESA

CONTROL OF A SERVOMECHANISM FOR AN ELASTIC BEAM Ph.D. Thesis [REGELING VAN EEN SERVOSYSTEEM VOOR EEN ELASTISCHE STAAF]
J. vanVugt 14 Feb. 1986 152 p In DUTCH; ENGLISH summary
(Rept-065.1708/86-0; ETN-86-98069) Avail: NTIS HC A08/MF A01

The modeling and the tip controller of a flexible arm are treated. Modal analysis was used to describe the modes with decoupled differential equations, which makes it possible to represent the modes with the graph technique. The parameters of the model were associated with the mass and compliance of a second order system. The coupling of the differential equations and the parameters of the model depend on the boundary conditions of the beam. For this model it is shown how to use wire strain gages for the identification of the states of the beam. The model is based on the assumption that only the output angle of the servo can be measured. This angle is the input of the model which gives the necessary states in the feedback loop to control the overall system. With this state-feedback controller every beam mode can be damped. ESA

A MULTILAYER CHANNEL ROUTER FOR NONRECTANGULAR CHANNELS
Marcel vanVeelen, Albert Schoute, and Ad tenBerg Apr. 1986 17 p
(INF-86-9; RNR-CAD/8604/1; ETN-86-98517) Avail: NTIS HC A02/MF A01

An algorithm for routing multilayer channels whose borders may be irregular and contain connection points in all layers and at every grid position is presented. No restrictions are posed on the wiring in different layers. The routing algorithm opens the way to solve general three dimensional routing problems. The method incorporates a range of strategies which handle connection problems of different complexity. In most (practical) situations a straightforward and fast algorithm is employed. However, as the density of terminals at the borders increases, more complex strategies are required. In the extreme case, which is only of theoretical interest, a solution can even be found if at each channel side all but two grid positions are occupied by terminals. ESA

A VISCOUS/INVISCID ZONAL METHOD FOR THE COMPUTATION OF 2 AND 3-DIMENSIONAL COMPRESSIBLE FLUID FLOWS WITH SEPARATION
Jack Strigberger 1986 170 p
Avail: Univ. Microfilms Order No. DA8608234

A zonal finite-difference method has been developed to compute compressible high Reynolds number flows with separation. The method utilizes a partitioning of the flow-field so as to solve the full potential equation in a zone where the flow is irrotational and the compressible thin-layer Navier-Stokes or Euler equations in the other zones. This zonal approach is taken in the interests of saving computation time compared with a non-zonal thin-layer Navier-Stokes approach. Proper interaction between the zones is achieved by overlapping them and using the interior solution of one zone to provide appropriate boundary conditions for another zone. Zonal interface inconsistencies can readily arise, and some rules and techniques for their alleviation have been developed. The method has been applied to the steady viscous flows about a circular cylinder and about a hemisphere/cylinder at moderate incidence. Excellent agreement was obtained between zonal and nonzonal computations in two dimensions and reasonable agreement has been obtained in three dimensions. The effects of grid topology and coarseness and of the various approximations and inaccuracies of the constituent flow solvers have been noted. Dissert. Abstr.

EFFECTIVENESS: N SUB TU RELATIONSHIPS FOR THE DESIGN AND PERFORMANCE EVALUATION OF TWO-STREAM HEAT EXCHANGERS
Jul. 1986 144 p Supersedes ESDU-85042
(ESDU-86018; ISBN-0-85679-570-4; ISSN-0141402X) Avail: ESDU

This Data Element ESDU 86018 is an addition to the Heat Transfer Sub-series. Equations and a large number of curves derived from them are given to allow design or performance evaluation of shell-and-tube and crossflow heat exchangers. The curves cover co-current and counter-current flow and various numbers of shells and of tube side passes. Also shown on the curves are the locus of designs for which a temperature cross may occur and the locus of 95% heat transfer effectiveness

which indicates the region of uneconomic design. The method assumes a linear temperature/enthalpy relationship (constant specific heat capacity) for both streams. It applies to boiling or condensing flow of a single component with no temperature change, or boiling and condesning flow of a mixture that is always two phase. It excludes conditions in which transition from single to two phase flow occurs. Worked examples show the application of the method and comparisons are included that show the relative performance of various exchanger designs. ESDU

SIMULATIONS OF TURBULENT MIXING AND REACTING FLOWS AND THEIR APPLICATIONS TO TURBULENCE MODELING Semiannual Progress Report

Joel H. Ferziger and Brian J. Cantwell Jul. 1986 21 p
(Grant NAG1-532)
(NASA-CR-179829; NAS 1.26:179829) Avail: NTIS HC A02/MF A01 CSCL 20D

The method of full simulation is applied to reacting turbulent flows. Full simulation has proven of great value as a complement to experiments for the study of nonreacting turbulent flows. It provides insight into the physics of turbulent flows and their modeling. It is natural to try to extend these methods to the simulation of reacting turbulent flows. Because this is one of the first attempts at this type of simulation, a subsidiary goal of this work is to demonstrate the feasibility of using simulation to study turbulent reacting flows. In addition, it is shown that such simulations can be used to provide physical insight into the nature of turbulent combustion and to provide data that will help to construct models that can be used in engineering simulations of turbulent reacting flows. THIRD-MOMENT CLOSURE OF TURBULENCE FOR PREDICTIONS OF SEPARATING AND REATTACHING SHEAR FLOWS: A STUDY OF REYNOLDS-STRESS CLOSURE MODEL Final Report

R. S. Amano and Pankaj Goel Sep. 1986 91 p
(Grant NAG3-546)
(NASA-CR-177055; NAS 1.26:177055; TF/86/9) Avail: NTIS HC A05/MF A01 CSCL 20D

A numerical study of computations in backward-facing steps with flow separation and reattachment, using the Reynolds stress closure is presented. The highlight of this study is the improvement of the Reynold-stress model (RSM) by modifying the diffusive transport of the Reynolds stresses through the formulation, solution and subsequent incorporation of the transport equations of the third moments, bar-u(i)u(j)u(k), into the turbulence model. The diffusive transport of the Reynolds stresses, represented by the gradients of the third moments, attains greater significance in recirculating flows. The third moments evaluated by the development and solution of the complete transport equations are superior to those obtained by existing algebraic correlations. A low-Reynolds number model for the transport equations of the third moments is developed and considerable improvement in the near-wall profiles of the third moments is observed. The values of the empirical constants utilized in the development of the model are recommended. The Reynolds-stress closure is consolidated by incorporating the equations of k and e, containing the modified diffusion coefficients, and the transport equations of the third moments into the Reynolds stress equations. Computational results obtained by the original k-e model, the original RSM and the consolidated and modified RSM are compared with experimental data. Overall improvement in the predictions is seen by consolidation of the RMS and a marked improvement in the profiles of bar-u(i)u(j)u(k) is obtained around the reattachment region. M.G.

EFFECT OF VIBRATION AMPLITUDE ON VAPOR CAVITATION IN JOURNAL BEARINGS

David E. Brewe and Bo O. Jacobson (Lulea Univ, Sweden) 1986 17 p Presented at the Nordic Symposium on Tribology, Lulea, Sweden, 15-18 Jun. 1986; sponsored by the Royal Swedish Academy of Engineering Sciences
(NASA-TM-88826; E-3200; NAS 1.15:88826; USAAVSCOM-TR-86-C-26) Avail: NTIS HC A02/MF A01 CSCL 20D

Computational movies were used to analyze the formation and collapse of vapor cavitation bubbles in a submerged journal bearing. The effect of vibration amplitude on vapor cavitation was studied for a journal undergoing circular whirl. The boundary conditions were implemented using Elrod's algorithm, which conserves mass flow through the cavitation bubble as well as through the oil-film region of the bearing. The vibration amplitudes for the different cases studied resulted in maximum eccentricity ratios ranging from 0.4 to 0.9. The minimum eccentricity ratio reached in each case was 0.1. For the least vibration amplitude studied in which the eccentricity ratio varied between 0.1 and 0.4, no vapor cavitation occurred. The largest vibration amplitude (i.e., eccentricity ratios of 0.1 to 0.9) resulted in vapor cavitation present 76 percent of one complete orbit. Author

ON THE MAXWELLIAN DISTRIBUTION, SYMMETRIC FORM, AND ENTROPY CONSERVATION FOR THE EULER EQUATIONS

Suresh M. Deshpande Nov. 1986 30 p
(NASA-TP-2583; L-16036; NAS 1.60:2583) Avail: NTIS HC A03/MF A01 CSCL 20D

The Euler equations of gas dynamics have some very interesting properties in that the flux vector is a homogeneous function of the unknowns and the equations can be cast in symmetric hyperbolic form and satisfy the entropy conservation. The Euler equations are the moments of the Boltzmann equation of the kinetic theory of gases when the velocity distribution function is a Maxwellian. The present paper shows the relationship between the symmetrizability and the Maxwellian velocity distribution. The entropy conservation is in terms of the H-function, which is a slight modification of the H-function first introduced by Boltzmann in his famous H-theorem. In view of the H-theorem, it is suggested that the development of total H-diminishing (THD) numerical methods may be more profitable than the usual total variation diminishing (TVD) methods for obtaining wiggle-free solutions. NUMERICAL SOLUTION OF THE INCOMPRESSIBLE NAVIER-STOKES EQUATIONS IN THREE-DIMENSIONAL GENERALIZED CURVILINEAR COORDINATES

Stuart E. Rogers, Dochan Kwak, and James L. C. Chang (Rockwell International Corp., Canoga Park, Calif.) Jan. 1986 44 p
(NASA-TM-86840; A-85413; NAS 1.15:86840) Avail: NTIS HC A03/MF A01 CSCL 20D

Numerically solving the incompressible Navier-Stokes equations is known to be time consuming and expensive. Testing of the INS3D computers code, which solves these equations with the use of the pseudocompressibility method, shows this method to be an efficient way to obtain the steady state solution. The effects of the waves introduced by the pseudocompressibility method are analyzed and criteria are set and tested for the choice of the pseudocompressibility parameter which governs the artificial sound speed. The code is tested using laminar flow over a two dimensional backward-facing step, and laminar flow over a two dimensional circular cylinder. The results of the computations over the backward-facing step are in excellent agreement with experimental results. The transient solution of the flow over the cylinder impulsively started from rest is in good agreement with experimental results. However, the computed frequency of periodic shedding of vortices behind the cylinder is not in agreement with the experimental value. For a three dimensional test case,

computations were conducted for a cylinder end wall junction. The saddle point separation and horseshoe vortex system appear in the computed field. The solution also shows secondary vortex filaments which wrap around the cylinder and spiral up in the wake. Author

LOSSES IN FOUNTAIN-EFFECT PUMPS
Peter Kittel Apr. 1986 9 p
(NASA-TM-88232; A-86184; NAS 1.15:88232) Avail: NTIS HC A02/MF A01 CSCL 20D

Three loss mechanisms in fountain-effect pumps are identified and analyzed. Two of these mechanisms reduce the mechanocaloric effect, by reducing the mass transferred per unit heat input. The first loss mechanism of these losses is the result of normal fluid leakage through the pump. The second loss mechanism is the result of the finite separation between the porous plug and the heater. The third loss mechanism reduces the thermomechanical effect. It results from the Gorter-Mellink interaction within the porous plug. All three of these loss mechanisms are shown to reduce pump efficiency. They are then applied to an example to illustrate the relative significance of the three mechanisms. Author

THERMAL ANALYSIS OF RADIOMETER CONTAINERS FOR THE 122m HOOP COLUMN ANTENNA CONCEPT
Lawrence A. Dillon-Townes Sep. 1986 54 p
(NASA-TM-89026; NAS 1.15:89026) Avail: NTIS HC A04/MF A01 CSCL 20D

A thermal analysis was conducted for the 122 Meter Hoop Column Antenna (HCA) Radiometer electronic package containers. The HCA radiometer containers were modeled using the computer aided graphics program, ANVIL 4000, and thermally simulated using two thermal programs, TRASYS and MITAS. The results of the analysis provided relationships between the absorptance-emittance ratio and the average surface temperature of the orbiting radiometer containers. These relationships can be used to specify the surface properties, absorptance and reflectance, of the radiometer containers. This is an initial effort in determining the passive thermal protection needs for the 122 m HCA radiometer containers. Several recommendations are provided which expand this effort so specific passive and active thermal protection systems can be defined and designed. Author

ASYMPOTIC SOLUTIONS TO COMPRESSIBLE LAMINAR BOUNDARY-LAYER SOLUTIONS FOR DUSTY-GAS FLOW OVER A SEMI-INFINITE FLAT PLATE
B. Y. Wang (Academia Sinica, Beijing, China) and I. I. Glass Aug. 1986 84 p Sponsored in part by Natural Sciences and Engineering Research Council, and by Defence Research Establishment, Suffield
(Contract DNA001-85-C-0368; Grant AF-AFOSR-82-0096)
(UTIAS-310; ISSN-0082-5255) Avail: NTIS HC A05/MF A01

An asymptotic analysis is given of the compressible, laminar boundary-layer flow of a dilute gas-particle mixture over a semi-infinite flat plate. The analysis extends existing work by considerating more realistic drag and heat-transfer relations than those provided by Stokes. A more general viscosity-temperature expression is also incorporated into the analysis. The solution involves a series expansion in terms of the slip parameter of the particles. The numerical results, including the zeroth and first-order approximations for the gas and particle phases, are presented for the two limiting regimes: the large-slip limit near the leading edge and the small-slip limit far downstream. Significant effects on the flow produced by the particles with Stokes' and nonStokes' relations are studied and clarified. The effects of some nondimensional similarity parameters, such as the Reynolds, Prandtl, and Eckert numbers, on the two phase boundary-layer flow are discussed. Author

EFFECTS OF FORCED AND FREE CONVECTIONS ON STRUCTURAL TEMPERATURES OF SHUTTLE ORBITER DURING REENTRY FLIGHT
William L. Ko, Robert D. Quinn, and Leslie Gong 1986 18 p
(NASA-TM-86800; H-1329; NAS 1.15:86800) Avail: NTIS HC A02/MF A01 CSCL 20D

Structural performance and resizing (SPAR) finite-element thermal analysis computer program was used in the heat transfer analysis of the space shuttle orbiter wing subjected to reentry aerodynamic heating. With sufficient external forced convective cooling near the end of the heating cycle, the calculated surface temperatures of the thermal protection system (TPS) agree favorably with the flight data for the entire flight profile. However, the effects of this external forced convective cooling on the structural temperatures were found to be negligible. Both free convection and forced convection elements were introduced to model the internal convection effect of the cool air entering the shuttle interior. The introduction of the internal free convection effect decreased the calculated wing lower skin temperatures by 20 F at most, 1200 sec after touchdown. If the internal convection is treated as forced convection, the calculated wing lower skin temperatures after touchdown can be reduced to match the flight-measured data very closely. By reducing the TPS thicknesses to certain effective thickness to account for the TPS gap heating, the calculated wing lower skin temperatures prior to touchdown can be raised to agree with the flight data perfectly. VELOCITY MEASUREMENTS FOR TURBULENT NONSEPARATED FLOW OVER SOLID WAVES Progress Report, 1982 - 1985
Kenneth A. Frederick and Thomas J. Hanratty 18 Dec. 1985 280 p
(Contract N00014-82-K-0324)
(AD-A168682; PR-6) Avail: NTIS HC A13/MF A01 CSCL 20/4

Laser-Doppler velocimetry measurements have been made of nonseparated velocity fields over solid sinusoidal wavy surfaces. Time-averaged velocity and turbulent intensity data are given. The measurements were conducted over waves on the bottom wall of a rectangular channel with a cross section of twenty four by two

inches, the two inch dimension being vertical. Two sets of velocity data were obtained at conditions corresponding to flows where linear and nonlinear shear stress responses are observed. The conditions were wave steepnesses 2a lambda, and channel Reynolds numbers of 0.03125, 6400, and 0.05, 38,800 respectively. The wavelength of the waves was two inches. The viscous wall region was of particular interest. Sufficient measurements were taken to give an accurate representation of both the streamwise and normal variation of the viscous wall region. The data was Fourier analyzed to determine the extent of nonlinearities, the wavelength average flowfields, and the amplitudes and phases of the velocity responses. The physical meaning of the data is interpreted in terms of pressure gradient effects along the wave surfaces. Comparisons of the data with prediction from simple eddy viscosity models are also given. GRA

CALIBRATION OF SURFACE HOT-FILM SENSORS IN DILUTE POLYMER FLOWS Final Report
Montgomery B. Goforth, Dennis K. McLaughlin, and Robert L. Gran Jun. 1986 51 p
(AD-A168801; DT-8451-02) Avail: NTIS HC A04/MF A01 CSCL 20/4

The purpose of this study was to assess the feasibility of using flush-mounted surface hot-film sensors in dilute polymer solutions to measure mean wall shear stress. Experiments were conducted using hot-film sensors mounted on the surface of a rotating disk. It is shown that a sensor calibration obtained in a pure water flow cannot be used directly to provide accurate skin friction measurements in a dilute polymer flow. However, the repeatability of the results suggests that a functional relation may exist between a sensor's calibration in water and in dilute polymer, thereby permitting precalibration of the sensor in pure water. It is also possible that reasonably consistent measurements may be obtained by precalibration of sensors in controlled polymer solutions (say in a laminar flow regime for which the wall shear stress is unaffected by the presence of the polymer). Experiments were also conducted by injecting concentrated polymer solution (4000 ppm) into the boundary layer of the rotating disk. Drag reduction and hot-film performance comparable to that obtained with homogenous dilute polymer solution was demonstrated. GRA

DESIGN OF HEAT EXCHANGE ELEMENT FOR PLASTIC FILM HEAT EXCHANGER
E. C. Guyer and D. L. Brownell 28 Dec. 1984 41 p
(Contract DE-AC07-84ID-12550)
(DE86-011042; DOE/ID-12550/T2) Avail: NTIS HC A03/MF A01

This report presents the results of an effort to design a plastic film heat exchanger element (PFHX) suitable for use in an industrial heat pump evaporator. This report addresses the selection of materials, the expected flow and heat transfer behavior, and the mechanical design features of a parallel plate type exchanger that uses thin plastic films as the boundary between the two process fluids. Criteria for material selection are presented, candidate materials are reviewed, and material recommendations are provided. Heat transfer performance is addressed in terms of the overall or total coefficient of heat transfer between condensing steam and a confined falling film of water. Appropriate mechanical designs of water flow manifolds are described along with methods of fabrication and assembly. This report addresses only the individual heat exchange element. DOE

MONTE CARLO SIMULATION OF FREE JET FLOW FROM A SLIT, REVISION 1
J. B. Anderson, J. D. Foch, M. J. Shaw, R. C. Stern, and B. J. Wu 1986 12 p Presented at the 15th International Symposium on Rarefield Gas Dynamics, Grado, Italy, 16 Jun. 1986 Prepared in cooperation with Pennsylvania State Univ., University Park
(Contract W-7405-eng-48)
(DE86-011877; UCRL-93788-Rev-1; CONF-860636-1-Rev-1) Avail: NTIS HC A02/MF A01

The expansion of a free jet from a slit source into a vacuum has been simulated using the Monte Carlo procedures developed by Bird. The calculations were made for hard-sphere molecules (gamma = 5/3) at several densities to examine the departures from translational equilibrium in the flow field. Results are compared with the predictions of a method-of-characteristics calculation for continuum inviscid flow. The variations of the three components of the kinetic temperature are similar to those of a cylindrical source expansion. Molecular velocities perpendicular to the flow are found to depart from Maxwellian distributions at large distances from the slit. DOE

NEW HIGH TEMPERATURE ABSORBENT FOR ABSORPTION HEAT PUMPS Final Report
W. F. Davidson and D. C. Erickson May 1986 60 p
(Contract DE-AC05-84OR-21400)
(DE86-012483; ORNL/Sub-85-22013/1) Avail: NTIS HC A04/MF A01

A new absorption working pair (AWP) for absorption heat pumps has been identified which provides higher temperature capability (260 C), higher lifts, and use of lower cost construction materials, than currently available absorption heat pump working fluid pairs (e.g., LiBr-H2O). Using water as working fluid, the absorbent is a ternary mixture of LiNO3, KNO3, and NaNO3 in the preferred proportions of 53, 28, and 19 weight percent, respectively. In addition to being thermally stable above 260 C, it promotes the formation of a passive and protective corrosion resistant oxide film on both mild steel and all stainless steels. The thermodynamic, corrosion, and stability properties of this new absorbent have been measured. At temperatures of 260 C and higher the absorbent has negligible thermal decomposition, has corrosion rates less than 1 mil/year for both carbon steel and austenitic stainless steel, and provides practical heat pumping lifts of up to 90 C.DOE

MEASUREMENT AND PREDICTION OF LIQUID MIXTURE THERMAL CONDUCTIVITY AND VISCOSITY Final Report
R. L. Rowley 15 Jun. 1986 22 p
(Contract DE-FG02-84ER-13193)
(DE86-012508; DOE/ER-13193/2) Avail: NTIS HC A02/MF A01

A local composition model has been developed for prediction of liquid mixture thermal conductivities and shear viscosities from pure component values and readily available binary thermodynamic data. The method is applicable to any number of components and requires no adjustable parameters. Viscosities were measured in an Ubelohde capillary viscometer and densities were measured in a Mettler-Paar densitometer over the whole composition range for 24 binary and 20 ternary liquid mixtures at 25 C and ambient pressure. A new, transient, hot-wire thermal conductivity apparatus was constructed and used to measure the thermal conductivity over the whole composition range at 25 C and 1 atm for 24 ternary mixtures, including 14 pure components and the binary limits of the ternaries. These data indicate that the local composition model works quite well for both thermal conductivity and shear viscosity. DOE

FREE CONVECTION HEAT TRANSFER IN THE CRITICAL REGION OF BINARY FLUID MIXTURES
D. Jump and E. Marschall 1986 7 p Presented at the International Heat Transfer Conference, San Francisco, Calif., 17 Aug. 1986
(Contract DE-AS03-84ER-13164)
(DE86-008856; CONF-860805-9; CONF-8510176-4) Avail: NTIS HC A02/MF A01

Free convection heat transfer from a heated wire to near critical binary mixtures of R-22 and R-115 was investigated experimentally. Measurements included determination of mixture bulk temperature and pressure, wire temperature and heat flux at the wire surface, and mixture concentration. Observed heat transfer and fluid flow patterns were very similar to those known to occur in near critical pure fluids. Modest peaks in heat transfer coefficients were found at small temperature differences for all mixtures. For bulk fluid temperatures slightly below their critical temperatures boiling-like phenomena were observed and the corresponding maximum heat transfer coefficients were found to be up to 600% higher than those obtained at larger temperature differences. LIFT AND DRAG MEASUREMENTS ON A TOWING TANK MODEL OF A TIP VANE TURBINE
L. J. Vermeer Nov. 1985 32 p
(IW-R512; ETN-86-98484) Avail: NTIS HC A03/MF A01

To measure the lift on the tip vanes of a rotating model (nearly impossible in the wind tunnel because the centrifugal force exceeds the lift force by 500 times) a measuring device was designed and built to operate under water in a towing tank. The measured quantities are the radial force on one tip vane and the torque to drive the model, from which respectively the lift and drag coefficient of the tip vane are deduced. This was done for several settings of tip vane angles for tip-speed ratios from 4 to 13 by unity steps. For better turbine simulation a gauze was added behind the model, but all settings were also measured without gauze. The results are suitable for comparison with a time averaged theory. ESA

(PB86-203239; TE4367-21-86; GRI-0063) Avail: NTIS HC A06/MF A01 CSCL 13A

The development of a novel condensing heat exchanger, a modulating gas burner, and a zone-controlled residential warm-air heating system is described. The condensing heat exchanger uses ten thermosyphons which are manifolded at both the condenser and evaporator ends to achieve a compact low-cost design. Initial tests have demonstrated a + 92 percent steady-state efficiency for a conventional clamshell furnace operating with the thermosyphon heat exchanger located outside the furnace cabinet. A 100,000 -Btu/hr modulating burner has also been developed. Comprehensive study of the burner's operating characteristics has produced guidelines for the design and application of the device. Finally, the modulating burner has been incorporated into a zone-controlled heating system. In parallel with the development of the preceding heating system components, the performance of thermosyphons over a wide range of operating conditions is being explored with the objective of improving design procedures for incorporating these devices into heat exchangers. RESEARCH ON AN AERODYNAMIC PARTICLE SEPARATOR (THE EPS)
Bernard Etkin Jul. 1986 37 p
(UTIAS-316; ISSN-0082-5255) Avail: NTIS HC A03/MF A01

Research carried out in support of the development of a new particle separator is presented. The latter (EPS) produces multiple fractions simultaneously at a high throughput rate. The cut sizes are roughly in the range 10 to 200 microns. The principle is that particles dissimilar with respect to any of size, density, or shape will follow different and distinct trajectories when injected into a uniform laminar flow of air. The main features of the design are: (1) particles are conveyed pneumatically at high speed into the separation zone; (2) they are separated from the feed air at the entrance to the separation zone by means of the Coanda Effect; (3) the air flow in the separation zone is uniform and laminar, the rms turbulence level being less than 1%; air speed in the separation zone is of the same order as the particle speed; and (4) the particles are subjected to large forces, both aerodynamic and mechanical, at several points on their path from the feed hopper to the separation zone, thus promoting dispersion. The report verifies the design concepts. A detailed model of the flow field permits the calculation of particle trajectories, and hence the prediction of coarse grade efficiency and sharpness of cut d sub 25/d sub 75. The measurements made with glass spheres and other irregular particles (e.g., carbon, cement) provide a general verification of the analytical results. Sharpness of cut values better than 0.8 are achieved down to cut points of about 10 microns. Maximum throughput rates are not yet known, but separations have been made at 480 kg/hr in a separation zone 100 mm wide. Scale-up to larger capacity is straightforward. Author

A SOLID STATE DATA RECORDER FOR SPACE-BASED APPLICATIONS USING MAGNETIC BUBBLE MEMORY M.S. Thesis
Tina-Marie DErcole Mar. 1986 92 p

(AD-A168909) Avail: NTIS HC A05/MF A01 CSCL 14/3

Earthbound recording systems come in may sizes and use various mediums on which to record the data. The harsh environment of space, however, introduces some unique problems. This limits the number of choices not only for the type of system but also for the optimum recording medium. How changes in temperature, radiation, lack of air, etc., affect the performance of the device as a whole must all be considered. Magnetic bubble memory technology implemented in a solid state recorder is a possible solution. Included in this thesis is a description of the development and history of the magnetic bubble memory, along with a comparison to other technologies. The design and implementation of a digital data recorder using off-the-shelf four-megabit devices is presented. A schematic of the data recorder and software used is included in the appendices. VERIFYING STRAIN GAGE INSTALLATIONS FOR DYNAMIC TESTS

Robert T. Reese and Rodney A. May 1986 10 p Presented at Conference

(DE86-006469; SAND-86-0349C; CONF-860264-1) Avail: NTIS HC A02/MF A01

Strain gages were used to determine the dynamic response of test structures subjected to high speed water entry. The strain gage installations were verified to be functional prior to and after the conclusion of a series of water entry tests. The procedures used to verify the gage installations are described. The methodology developed for this test application will be used on other test projects in which test hardware will be developed into intrumented transducers or for those projects requiring additional analysis of strain gage data and installations. Some of the problems encountered in installing the strain gages are outlined along with the methods and procedures used to solve them. Author

AUDIOMAGNETOTELLURIC (AMT) SYSTEM

1986 11 p Presented at the 10th Annual Naticnal Engineering Symposium, San Antonio, Tex., 9 Apr. 1986

(Contract DE-AC08-83NV-10282)

(DE86-011274; CONF-8604207-1) Avail: NTIS HC A02/MF A01

The task was to design and build a portable system for collecting and analyzing AMT signals in the 10Hz to 10 kHz frequency range. The system consisted of both a backpack-portable data acquisition system and a data analysis computer. Audio magnetotellurics (AMT) is a way of determining the electrical resistivity distribution of the Earth's subsurface from measurements of natural electric and magnetic fields (lightning strikes). AMT provides a means of geothermal and petroleum exploration. In the past ten years, different approaches to AMT data acquisition instrumentation have been taken. This report summarizes EG and G, Los Alamos Operations Version. DOE

A STUDY OF LASER INDUCED IONIZATION OF ALKALI METAL VAPOURS BASED ON SATURATION OF THE FIRST RESONANCE TRANSITION Thesis

Paul Gerard Giles Cardinal Sep. 1986 255 p

(UTIS-299; ISSN-0082-5255) Avail: NTIS HC A12/MF A01

Laser saturation of an atomic resonance represents an extremely efficient method of ionizing a gaseous medium. In the case of an alkali metal vapor it is shown that many collisional-radiative processes contribute to the initial creation of free electrons which, after acquiring additional energy via superelastic collision quenching of the resonance state population, eventually leads to nearly complete ionization of the vapor. This form of laser ionization based on resonance saturation (LIBORS) was studied both theoretically and experimentally in the case of sodium and to a lesser extent for other alkali metal vapors. The theoretical analysis has involved the development of several simple models and significant improvements to an already existing 20-level computer code. A LIBORS experimental facility was assembled for undertaking careful measurements of the interaction in order to test the theoretical models. Measurements of the absorbed laser energy versus that incident provided indirect confirmation of the importance of superelastic electron collisions. Also reported are the first emission based measurement of the spatially averaged free-electron temperature associated with LIBORS. Author

SUMMARY OF CONTROL AND DATA ACQUISITION SYSTEMS FOR NOVA EXPERIMENTS

E. W. McCauley, E. M. Campbell, J. M. Auerbach, D. S. montgomery, V. A. Martin, J. E. Randolph, J. G. Shaw, B. L. Stewart, and G. F. Stone Apr. 1986 22 p Presented at the 6th Topical Conference on High Temperature Plasma Diagnostics, Hilton Head Island, S.C., 9 Mar 1986

(Contract W-7405-eng-48)

(DE86-010563; UCRL-94398; CONF-860324-29) Avail: NTIS HC A02/MF A01

The Nova Laser has completed its first year of operation. During this period, emphasis has been placed on activation of the facility and of the numerous target and beam diagnostics. Two separate target chambers are in use. Nova operation is separated into two broad functions: Laser Operations and Experiments. The Operations Group provides the laser system control, operation and data acquisition and the Experiments Group provides experiment definition, diagnostic instrumentation and overall data processing. On the Operations side, VAX 11/780 computers are used to set up diagnostic operating parameters and collect data recorded by the CAMAC and CCD modules. These data are delivered in files by electronic link to the Laser Experiments and Analysis Facility (LEAF) VAX 11/785 of the Experiments Group for processing. Film data are digitized at LEAF and the film data files are also processed on the LEAF VAX. DOE

ABSORPTION OF CO2 LASER BEAMS BY METALLIC ALLOYS. APPLICATION TO LASER THERMAL TREATMENT [ABSORPTION D'UN RAYONNEMENT LASER CO2 CONTINU PAR DI-

FFERENTS ALLIAGES METALLIQUES. APPLICATION AU TRAITEMENT THERMIQUE PAR LASER]
G. Stern and B. Gautier 19 Jul. 1985 23 p In FRENCH Presented at 5th Journees Europeennes Conference Optoelectronique, Paris, France, 21-23 May 1985
(ISL-CO-217/85; ETN-86-97627) Avail: NTIS HC A02/MF A01

The electromagnetic absorption at 10.6 micron wavelength was studied for low alloy steels and titanium alloys, in order to predict the feasibility of continuous CO2 laser thermal treatments. Laser calorimeter and elliptic mirror reflectometer were used. The results show a strong influence of the surface finish. The absorption increases almost linearly with temperature. A two dimensional numerical model of heat diffusion was developed to describe the temperature evolution of 15 x 15 x 2 mm specimens under a 3 kw laser beam. The heat absorbed, 200 to 450 W per sq cm, is insufficient to obtain temper effects. ESA

CALCULATION METHODS FOR STEADILY LOADED AXIAL GROOVE HYDRODYNAMIC JOURNAL BEARINGS. LOW VISCOSITY PROCESS FLUID LUBRICATION.
Jul. 1986 21 p Supersedes ESDU-77013
(ESDU-86008; ISBN-0-85679-560-7; ISSN-0141-2590) Avail: ESDU

This Data Item ESDU 86008 is an addition to the Tribology Sub-series. The advantages are discussed and the essential additional considerations in using a process fluid as a lubricant are explained. Appropriate bearing materials are particularly important and tables of data allow suitable choices for a range of process fluids, with particular emphasis on water. Tables (and graphs) also give those physical properties that are important in bearing design for a number of fluids, including the usable temperature range. A preliminary design procedure allows an initial choice of bearing dimensions to be made and then, using ESDU 85028, it can be decided whether the flow is superlaminar or not. In the latter case, ESDU 84031 is used to calculate the performance and, if necessary, optimize the design, while in the former case ESDU 85028 is used for that purpose. ESDU

SELECTION OF ROLLING-ELEMENT BEARING STEELS FOR LONG-LIFE APPLICATION
Erwin V. Zaretsky 1986 76 p Presented at International Symposium on the Effect of Steel Manufacturing Processes on the Quality of Bearing Steels, Phoenix, Ariz., 4-6 Nov. 1986; sponsored by American Society for Testing and Materials
(NASA-TM-88881; E-3288; NAS 1.15:88881) Avail: NTIS HC A05/MF A01 CSCL 13I

Nearly four decades of research in bearing steel metallurgy and processing have resulted in improvements in bearing life by a factor of 100 over that obtained in the early 1940's. For critical applications such as aircraft, these improvements have resulted in longer lived, more reliable commercial aircraft engines. Material factors such as hardness, retained austenite, grain size and carbide size, number, and area can influence rolling-element fatigue life. Bearing steel processing such as double vacuum melting can have a greater efect on bearing life than material chemistry. The selection and specification of a bearing steel is dependent on the integration of all these considerations into the bearing design and application. The paper reviews rolling-element fatigue data and analysis which can enable the engineer or metallurgist to select a rolling-element bearing steel for critical applications where long life is required. ACTIVE CONTROL OF ROBOT MANIPULATOR COMPLIANCE Semiannual Progress Report
Charles C. Nguyen and Farhad J. Pooran Nov. 1986 64 p
(Grant NAG5-780)
(NASA-CR-177183; NAS 1.26:177183) Avail: NTIS HC A04/MF A01 CSCL 13I

Work performed at Catholic University on the research grant entitled Active Control of Robot Manipulator Compliance, supported by NASA/Goddard space Flight Center during the period of May 15th, 1986 to November 15th, 1986 is described. The modelling of the two-degree-of-freedom robot is first presented. Then the complete system including the robot and the hybrid controller is simulated on an IBM-XT Personal Computer. Simulation results showed that proper adjustments of controller gains enable the robot to perform successful operations. Further research should focus on developing a guideline for the controller gain design to achieve system stability. Author

Engine testing, ceramic component fabrication and evaluation, component performance rig testing, and analytical studies comprised AGT 100 activities during the 1985 year. Ten experimental assemblies (builds) were evaluated using two engines. Accrued operating time was 120 hr of burning and 170 hr total, bringing cumulative total operating time to 395 hr, all devoid of major failures. Tests identified the generator seals as the primary working fluid leakage sources. Power transfer clutch operation was demonstrated. An alpha SiC gasifier rotor engine test resulted in blade tip failures. Recurring case vibration and shaft whip have limited gasifier shaft speeds to 84%. Ceramic components successfully engine tested now include the SiC scroll assembly, Si3N3 turbine rotor, combustor assembly, regenerator disk bulkhead, turbine vanes, piston rings, and couplings. A compressor shroud design change to reduce heat recirculation back to the inlet was executed. Ceramic components activity continues to focus on the development of state-of-the-art material strength characteristics in full-scale engine hardware. Fiber reinforced glass-ceramic composite turbine (inner) backplates were fabricated by Corning Glass Works. The BMAS/III material performed well in engine testing. Backplates of MAS material have not been engine tested. Author

RELIABLE WELDING OF HSLA STEELS BY SQUARE WAVE PULSING USING AN ADVANCED SENSING (EDAP) TECHNIQUE
Final Report, 16 Jan. - 30 Apr. 1986
C. Connelly, G. F. Fetzer, R. G. Gann, and T. E. Aurand 30 Apr. 1986 109 p
(Contract N00014-85-C-0759)
(AD-A168762; Rept-0001-AZ) Avail: NTIS HC A06/MF A01 CSCL 13/8

A four part program was undertaken for the purposes of improving the reliability and predictability of welding. This was a Phase I SBIR research effort, funded by ONR, to demonstrate feasability of these proposed concepts: (1) Control automatically, in real time, weld nugget size and penetration. (2) Explore the use of square wave pulse welding for HSLA steels. (3) Develop a data base for pulsed GTA welding of A710 steel. (4) Determine the value of using an advanced video system for welding research. Most of this work was to proceed concurrently and simultaneously. However, difficulties encountered when making single pass, full penetration welds on A710 steels led to the completing of some of the research separately. The major concepts of weld control and pulse welding were both completed with very successful results. GRA

INERTIAL WELDING OF 1100 ALUMINUM TO TYPE 316 STAINLESS STEEL
D. Yashan, S. Tsang, and M. W. Doughty 1986 36 p
(DE86-009145; RFP-3851) Avail: NTIS HC A03/MF A01

Development done for inertia welds of 1100 aluminum of approximately an H-18 work hardened condition, to type 316 stainless steel is described. The welding was done with a Caterpillar Model 90 inertia machine. Rod diameters were .625 inch for the stainless steel and 1.000 inch for the aluminum. A broad range of weld parameters, as well as various steel surface geometries, were investigated. Test methods for 1100 aluminum to stainless steel friction welds are often limited by the strength of the aluminum. This work used a tensile configuration that has the capability of reaching high tensile stresses at the weld interface. The weld interface is located a very short distance (about .010 inch) from a larger diameter aluminum shoulder, therefore inducing a triaxial stress state in the aluminum near the weld interface. DOE

PRELIMINARY TURBULENCE LENGTH SCALE MEASUREMENTS IN A MOTORED IC ENGINE
R. A. Fraser, P. G. Felton, F. V. Bracco, and D. A. Santavicca (Pennsylvania State Univ., University Park) Feb. 1986 14 p Presented at Conference
(Contract DE-AC04-81AL-16338)
(DE86-008171; CONF-860263-2) Avail: NTIS HC A02/MF A01

A recently developed laser Doppler velocimetry system for making two point spatial correlation measurements of velocity fluctuations was applied to the turbulent flow field of an internal combustion engine. Fluctuation integral length scales were measured within the clearance volume of a ported, single cylinder engine with a disc shaped chamber and a compression ration of 8.0. The engine was motored at 600 rpm and the engine flow field had a swirl ratio at top dead center of approximately 4. These measurements were made at the center of the clearance height at 3/4 of the cylinder radius. The integral length scale was found to reach a minimum of approximately 1/5 of the clearance height near TDC. Comparison of the results obtained using this technique with the integral length scales measured in engines by other authors using different methods gives agreement to within a factor of two. Author

HIGH THROUGHPUT CONTINUOUS CRYOPUMP
C. A. Foster 1986 8 p Presented at the 6th Annual TVC AVS Symposium, Oak Ridge, Tenn., 29 Apr. 1986
(Contract DE-AC05-84OR-21400)
(DE86-010623; CONF-8604191-1) Avail: NTIS HC A02/MF A01

A cryocondensation pump with a unique regeneration mechanism that allows continuous operation has been constructed and tested. The pump features a device referred to as the Snail which removes the cryofrost layer as it is moved over the pumping surfaces. A forepump pumps the sublimed gas generated inside the Snail. The compression ratio of the pump is the ratio of the cryopump speed to the leakage conductance of the Snail. Deuterium had been pumped continuously at 30 torr.L/s at a speed of 2000 L/s and a compression ratio of 100. The pump, being all metal sealed and free of lubricating fluids, has many potential applications where untraclean high throughput pumping is desirable. Since the pump regenerates on a time scale of 60 seconds, the inventory in the pump is minimized; an important consideration when pumping radioactive materials such as tritium. Test data and a videotape of the Snail removing the cryofrost will be shown. DOE

JOINING METHODS FOR BERYLLIUM: A SURVEY
L. A. Jacobson 16 May 1986 15 p
(Contract W-7405-eng-48)
(DE86-012000; UCID-20750) Avail: NTIS HC A02/MF A01

A number of reports from both open literature and classified sources were reviewed in order to extract information pertinent to the joining of beryllium to itself and to other alloys. The processes that were identified were brazing, gas metal arc welding, electron beam welding, resistance welding, and diffusion bonding. Unpublished results on the characterization of microstructures of beryllium welds containing aluminum suggest that liquid phase separation produces a structure that resists cracking. Features of the phase diagram of beryllium and silver suggest the possibility that a similar phenomenon would occur, leading to welds with higher temperature capability. DOE

ELECTROCHEMICAL EFFECTS ON WELD POOL CHEMISTRY IN SUBMERGED ARC AND dc ELECTROSLAG WELDING
M. Blander and D. L. Olson 1986 9 p Presented at the ASM International Trends in Welding Research Meeting, Gatlinburg, Tenn., 18 May 1986 Prepared in cooperation with Colorado School of Mines, Golden
(Contract W-31-109-eng-38)
(DE86-012117; CONF-860594-6) Avail: NTIS HC A02/MF A01

Electrochemical reactions could be an important factor governing the chemistry of weld pools in dc welding. The anodic reaction at the weld wire-slag interface leads to a relatively high Po2 which leads to the formation of an oxide nO2- + M(metal) yields MO(sub n) + 2ne where M is a metal at the weld wire-slag interface and n is related to the valence of M in the oxide. After the molten weld wire forms a droplet which separates from the

wire, the electrochemical reaction ceases and the oxide dissolves in the flux. The cathodic reactions at the weld pool lead to the electrodeposition of metals M sup 2 (slag) + 2e yields M(metal); Si sup 4+ (slag) + 4e yields Si(metal) where M can be Fe sup 2+ , Mn sup 2+, or other metals which are electrodeposited at the interface. The relative amounts of all these deposits will be readjusted by chemical reactions such as Si(metal) + 2MO(slag) yields SiO2(slag) + 2M(metal); Mn(metal) + FeO(slag) yields MnO(slag) + Fe(metal). The resultant changes in the compositions of the weld metal and the slag depend on the rates of the electrodeposition reactions relative to the rates of the back reactions. If the proposed mechanism is correct, experimental data would indicate that both the electrochemical and back reactions appear to be important. Analogous electrochemical reactions can occur at metal-plasma interfaces. DOE

RESEARCH ON MATERIALS RELATED TO THE SODIUM HEAT ENGINE Final Report
T. K. Hunt Mar. 1986 88 p
(Contract DE-AC03-76SF-00098)
(DE86-012833; LBL-21232) Avail: NTIS HC A05/MF A01

The Sodium Heat Engine (SHE) is a direct thermal to electrical energy conversion device using sodium beta''-alumina solid electrolyte (BASE) as an ion selective membrane and operating on the basic principle of a thermally regenerative concentration cell. SHE cells have demonstrated high output power densities and should be capable of high efficiency even in units of relatively small output power. The work performed under this subcontract was directed toward gaining an understanding of the problem of electrode stability as related to the Sodium Heat Engine and of the detailed manner in which this high power electrode-electrolyte system functions. Substantial progress toward this objective was made. DOE

MEASUREMENT ON THE SERVO-SYSTEMS OF THE ASEA IRB6/2 ROBOT AND ANALYSIS OF SERVOMOTORS FOR ROBOTS
J. Dupas Jul. 1984 115 p
(WPB-0131; ETN-86-98529) Avail: NTIS HC A06/MF A01

Measurements of the dynamic characteristics of the ASEA IRB6/2 robot, and developments in servomotors and drives for robot actuators are described. Measurements show that the effect of the load on each axis is very important, and decreases the dynamic possibilities of the robot. The first axis should be moved by a bigger motor. The fifth axis dynamic characteristics are lowered by the whole kinematic chain, and an improvement could be found in the simplification of the chain. The review of servomotors shows how a permanent magnet material could improve their characteristics. ESA

MODAL ANALYSIS OF ROBOTS [MODALE ANALYSE VAN ROBOTS]
P. A. W. Hijink and A. C. H. vanderWolf Dec. 1984 14 p in DUTCH
(WPB-0144; ETN-86-98531) Avail: NTIS HC A02/MF A01

Modal analysis as an experimental technique to determine the dynamic behavior of robots at given eigenfrequencies is presented. The signal analysis provides the displacements of the robot due to a force. The impulse response function is described using the discrete Fourier transform which is calculated with the fast Fourier transform algorithm. The modal parameters (a measure for amplitude and phase of a vibration) are determined for the chosen eigenfrequencies, and the results are shown on a display, after which data processing is possible using the plot apparatus. The results show that modal analysis is a powerful technique for the testing of industrial robots; and allows an automated reporting for the user as well as for the designer. ESA

STRETCHED CUSPS IN COUPLER CURVES: FOUR-BAR LINKAGES HAVING BALL-MODAL COUPLER POINTS [GESTREKTE KEERPUNTEN IN KOPPELKROMMEN: STANGENVIERZIJDEN MET RECHTGELEIDE OMKEERPUNTEN]
Evert A. Dijksman Dec. 1984 87 p In DUTCH Presented at DET Colloquium on Leer der Mechanismen, Enschede, Netherlands, 19 Oct. 1983
(EUT-84-W-001; B8465643; ISBN-90-6808-001-6;
ISSN-0167-9708; ETN-86-98532) Avail: NTIS HC A05/MF A01

A design in which the coupler point of a four-bar linkage passes through a so-called Ball-nodal (undulation) point is suggested for gripping mechanisms which approach products in a straight way. Solutions based on the Burmester theory appear to be interrelated through Robert's law; this intermixed relationship can be represented by a 3.0 graph. Transformation formulas, necessary to go from one apex to another, are presented. Longer edges represent Burmester transformations, whereas the shorter ones transform a four-bar into an appointed curve cognate according to Robert's law. The main dimensions of the four-bar are given as a function of two independent variables. Graphs giving information about the expected transmission angles are presented. The designer can use them as an indication to find out which four-bars are stretchable and which have transmission angles in the extreme positions of the rocker. ESA

The project objective is to design and test a prototype integrated Gas Engine Vapor Compression System, a system that is thought to be an attractive and economically viable alternative to currently available cogeneration systems. A unique, alternative cogeneration system has been designed that will provide an industrial or commercial energy user with high-pressure steam and electricity directly from a packaged cogeneration system. The integrated Gas Engine Vapor Compression System concept includes an engine-generator set and a steam screw compressor that is mechanically integrated with the engine. GRA

An automated inspection system is described for detecting, imaging, and classifying flaws in cannon billets. The first phase of the project has produced a flaw detection system capable of triggering rapidly and reliably on flaws down to one-fourth inch in cross-section in billets up to 18 feet in length and 22 inches in diameter. This portion of the system has been optimized for low cost, high speed, simplicity, and maintainability utilizing many commercially available components with a minimum use of one-of-a-kind electronic interface boards. It is a versatile, programmable stand-alone unit capable of scanning one billet every half hour. The second phase system is designed to considerably enhance the images of flaws which have been detected and located using the first phase system by providing a much larger ultrasonic array aperture and digitizing capacity. The resulting hardware is capable of both quasi-optic lens processing and digital holography. GRA

SYSTEM SAFETY PROCEDURES FOR NONDEVELOPMENT ITEM (NDI) ACQUISITIONS Final Report
Sami Hoxha May 1986 57 p
(AD-A168353; ARRAD-TR-86001) Avail: NTIS HC A04/MF A01 CSCL 15/5

Greater reliance on NDI types of acquisition is the wave of the future. It is important that the safety community realize this fact and come to grips with it. The means to be able to fit into the nondevelopment item (NDI) process without compromising safety must be developed. This requires both a determined effort on the part of the safety engineer to be involved early in the process and also the development of guidelines that clearly define the system safety role in the NDI acquisition process. NDI presents special safety problems due to the lack of testing, use in environment for which it is not designed, and lack of compliance with normally accepted Army safety standards. In cases where Army standards are not met, a conscious decision must be made whether or not the increased risk is acceptable. Based on this statement, NDI may not meet the safety standards that Army equipment developed through a normal acquisition process are required to meet; however, that does not mean safety has to be compromised. We also must not deviate from the objective of system safety, which is integral to its definition ...optimize safety within the constraints of operational effectiveness, time, and cost throughout all phases of the system life cycle. To accomplish this, a comprehensive System Safety Program Plan must be developed that will adequately interface with the NDI acquisition process. GRA

ESTIMATING JOINTLY SYSTEM AND COMPONENT RELIABILITIES USING A MUTUAL CENSORSHIP APPROACH
Hani Doss, Steven Freitag, and Frank Proschan Feb. 1986 35 p
(Contract F49620-85-C-0007)
(AD-A168544; FSU-STATISTICS-M717; TR-86-186-AFOSR; AF-AFOSR-86-0334TR) Avail: NTIS HC A03/MF A01 CSCL 12/1

Let F denote the life distribution of a coherent structure of independent components. Suppose that we have a sample of independent systems, each having the structure phi. Each system is continuously observed until it fails. For every component in each system, either a failure time or a censoring time is recorded. A failure time is recorded if the component fails before or at the time of system failure; otherwise a censoring time is recorded. We introduce a method for finding estimates for F(t), quantiles, and other functionals of F, based on the censorship of the component lives by system failure. We present limit theorems that enable the construction of confidence intervals for large samples. Author (GRA)

APPROXIMATE EVALUATION OF RELIABILITY AND AVAILABILITY VIA PERTURBATION ANALYSIS Annual Progress Report, 1 Jun. 1984 - 31 May 1985
Bruce K. Walker, Siu-Kwong Chu, and Norman M. Wereley Sep. 1985 45 p
(Grant AF-AFOSR-0160-84)
(AD-A168561; AFOSR-86-0314TR) Avail: NTIS HC A03/MF A01 CSCL 09/3

Progress is described on a project whose goal is the development of practical tools for evaluating the reliability and availability of fault-tolerant control or sensor systems. The approach relies on the generation of a Markovian model for the behavior of the system in terms of failures and Redundancy Management decisions. The project entails the investigation of approximate techniques for deriving results from these models. The basic idea is that the time-behavior of the model decomposes into two time scales where the results of interest occur in time frames intermediate to the two time scales. By modifying previous theory, an approximate evaluation scheme is developed and shown to be valid for a number of example cases. Ongoing work is also described. Author (GRA)

APPLYING, MEASURING AND MAINTAINING PRETENSION IN STEEL BOLTS
Jul. 1986 24 p Supersedes ESDU-72022
(ESDU-86014; ISBN-0-85679-566-6; ISSN-0141-4089; ISSN-0141-4097) Avail: ESDU

This Data Item ESDU 84014 is an addition to the Stress and Strength Sub-series. Factors are discussed which affect the tension in a bolt, and the methods are indicated by which a desired tension may be obtained, with a comparison of their relative accuracy and cost. Methods of measuring the bolt loads are also discussed. To determine the bolt pretension achieved by application of a known torque, the results of 1900 tests were analyzed to yield curves for both lubricated and unlubricated threads of BSF(BA)

and Unified or ISO metric forms. The test data related to nuts of mild and high strength steel seated on mild or high strength steel or aluminum alloy washers, and lubricants ranged from light oils to extreme pressure greases. No significant trend with material or lubricant could be isolated. Techniques for applying a known torque are considered, and their accuracy reviewed. Methods of locking the nut are described, together with their advantages and disadvantages, and include mechanical, frictional, adhesive, or deformation techniques. ESDU

CORRELATION OF FRACTURE TOUGHNESS AND CHARPY IMPACT TEST RESULTS
P. F. Langstone and D. I. Thorpe Sep. 1985 18 p
(Contract EXP-1/11/859)
(TR1063; BR97191; ETN-86-97979) Avail: NTIS
HC A02/MF A01

A test program to determine whether the Charpy impact test could be used to predict fracture toughness values was carried out. It is shown that there is a reasonably close correlation between Charpy impact and fracture toughness results for high strength, low toughness steels. There is, however, a greater scatter of results with high toughness steels. In material evaluation programs the impact test may be used to indicate the fracture toughness level, with a limited number of K(IC) tests to confirm predicted values. The fracture toughness test, however, must be used where exact K(IC) values are required, e.g., for calculation of the critical crack size in a component. Results also show that the toughness of air melted steel in the transverse orientation is considerably less than in the longitudinal direction; ESR steel has better transverse toughness than air melted grades; and approximate fracture toughness values can be calculated from invalid specimen data. CONCENTRATED MASS EFFECTS ON THE FLUTTER OF A COMPOSITE ADVANCED TURBOPROP MODEL
J. K. Ramsey and K. R. V. Kaza Oct. 1986 22 p
(NASA-TM-88854; E-3247; NAS 1.15:88854) Avail: NTIS
HC A02/MF A01 CSCL 20K

The effects on bending-torsion flutter due to the addition of a concentrated mass to an advanced turboprop model blade with rigid hub are studied. Specifically the effects of the magnitude and location of added mass on the natural frequencies, mode shapes, critical interblade phase angle, and flutter Mach number are analytically investigated. The flutter of a propfan model is shown to be sensitive to the change in mass distribution. Static unbalance effects, like those for fixed wings, were shown to occur as the concentrated mass was moved from the leading edge to the trailing edge with the exception of one mass location. Mass balancing is also inferred to be a feasible method for increasing the flutter speed. Author

(Contract NAS1-16723)
(NASA-CR-4000; NAS 1.26:4000; LMSC-D060755) Avail: NTIS
HC A04/MF A01 CSCL 20K

The power of the STAGS family of programs was greatly enhanced. Members of the family include STAGS-C1 and RRSYS. As a result of improvements implemented, it is now possible to address the full collapse of a structural system, up to and beyond critical points where its resistance to the applied loads vanishes or suddenly changes. This also includes the important class of problems where a multiplicity of solutions exists at a given point (bifurcation), and where until now no solution could be obtained along any alternate (secondary) load path with any standard production finite element code. (NASA-CR-179892; NAS 1.26:179892) Avail: NTIS
HC A05/MF A01 CSCL 20K

The elasticity problem for an infinite orthotropic flat plate containing a series of through and part-through cracks and subjected to bending and tension loads is considered. The problem is formulated by using Reissner's plate bending theory and considering three dimensional materials orthotropy. The Line-spring model developed by Rice and Levy is used to formulate the surface crack problem in which a total of nine material constants has been used. The main purpose of this study is to determine the effect of material orthotropy on the stress intensity factors, to investigate the interaction between two asymmetrically arranged collinear cracks, and to provide extensive numerical results regarding the stress intensity factors. The problem is reduced to a system of singular integral equations which is solved by using the Gauss-Chebyshev quadrature formulas. The calculated results show that the material orthotropy does have a significant effect on the stress intensity factor. Author

HC A06/MF A01 CSCL 20K

Optimization of dynamic systems involving complex non-hermitian matrices is often computationally expensive. Major contributors to the computational expense are the sensitivity analysis and reanalysis of a modified design. The present work seeks to alleviate this computational burden by identifying efficient sensitivity analysis and approximate reanalysis methods. For the algebraic eigenvalue problem involving non-hermitian matrices, algorithms for sensitivity analysis and approximate reanalysis are classified, compared and evaluated for efficiency and accuracy. Proper eigenvector normalization is discussed. An improved method for calculating derivatives of eigenvectors is proposed based on a more rational normalization condition and taking advantage of matrix sparsity. Important numerical aspects of this method are also discussed. To alleviate the problem of reanalysis, various approximation methods for eigenvalues are proposed and evaluated. Linear and quadratic approximations are based directly on the Taylor series. Several approximation methods are developed based on the generalized Rayleigh quotient for the eigenvalue problem. Approximation methods based on trace theorem give high accuracy without needing any derivatives. Operation counts

for the computation of the approximations are given. General recommendations are made for the selection of appropriate approximation technique as a function of the matrix size, number of design variables, number of eigenvalues of interest and the number of design points at which approximation is sought. OBSERVATION OF THE INITIATION AND PROGRESSION OF DAMAGE IN COMPRESSIVELY LOADED COMPOSITE PLATES CONTAINING A CUTOUT Progress Report
Anthony Waas and Charles Babcock, Jr. Nov. 1986 68 p
(Grant NsG-1483)
(NASA-CR-179911; NAS 1.26:179911; SM-86-34) Avail: NTIS HC A04/MF A01 CSCL 20K

A series of experiments was carried out to determine the mechanism of failure in compressively loaded laminated plates with a circular cutout. Real time holographic interferometry and photomicrography are used to observe the progression of failure. These observations together with post experiment plate sectioning and deplying for interior damage observation provide useful information for modelling the failure process. It is revealed that the failure is initiated as a localised instability in the zero layers, at the hole surface. With increasing load extensive delamination cracking is observed. The progression of failure is by growth of these delaminations induced by delamination buckling. Upon reaching a critical state, catastrophic failure of the plate is observed. The levels of applied load and the rate at which these events occur depend on the plate stacking sequence. Author

A WEDGE TEST FOR QUANTIFYING FULLY PLASTIC FRACTURE
Frank A. McClintock and Sara J. Wineman 30 May 1986 24 p
(Contract N00014-82-K-0025)
(AD-A168607) Avail: NTIS HC A02/MF A01 CSCL 20/11

A test using two wedges splitting a small, doubly grooved specimen allows measurement of stable, fully plastic crack initiation and growth under variable amounts of triaxiality. In wedge tests, 25 mm cubes of 1018 hot rolled steel in three different orientations exceeded the limit load predicted by plastic slip-line fields. The test gave crack tip initiation displacements of 0.7 to 0.8mm, regardless of orientation. Since microscopic examination of the fracture surfaces indicated that the wedges suppress blunting, the presence of non-zero initiation displacements suggests that a fracture process zone of finite thickness must be established before crack growth. During growth, a specimen with rolling direction normal to the crack plane had a crack growth ductility (minimum displacement per unit ligament reduction) of 0.006 to 0.009, compared to ductilities of 0.016 to 0.027 for specimens with rolling direction parallel to the crack front or parallel to the growth direction. The lower ductility with the crack normal to the rolling direction appears to be due to a smoother fracture surface without zigzagging between inclusion stringers. GRA

STUDIES OF STRAIN RATE EFFECTS IN THE DEFORMATION OF SOLIDS BY MEANS OF STRESS PULSES AND ULTRASONIC METHODS Progress Report, 1 Sep. 1984 - 31 Mar. 1985
C. Elbaum and A. Hikata 1986 31 p
(Contract DE-FG02-84ER-45165)
(DE86-012208; DOE/ER-45165/2) Avail: NTIS HC A03/MF A01

Strain rate sensitivity and deformation mechanism of LiF single crystals were studied at room temperature. Plastic deformations were induced by a split Hopkinson bar system. The range of strain rate covered is from 0.2/sec to 14/sec. Both annealed and irradiated single crystals of <100> crystallographic orientations were tested. Ultrasonic longitudinal and shear waves were propagated in the sample concurrently with the stress pulses and their attenuation and velocity changes were analyzed. It was found that the glide motions of dislocations are controlled by thermally activated processes with an activation volume of 7.9 x 10 to the -21 cu cm for annealed samples and 2 x 10 to the -21 cu cm for irradiated samples. The activation energy for annealed sample was estimated to be 0.63 eV. The strain rate sensitivity was found to be 0.53 MPa for annealed samples and 2.13 MPa for irradiated samples. The mobile dislocation density at 1.4 x 10 to the -3 shear strain was found to be 4 x 10 to the 7th power cm/cu cm. DOE

PERFORMANCE AND DESIGN OF COMPOSITE BEAMS WITH WEB OPENINGS
R. C. Donahey and D. Darwin Apr. 1986 284 p Sponsored by American Inst. of Steel Construction
(PB86-213105) Avail: NTIS HC A13/MF A01 CSCL 13M

Fifteen tests to failure were carried out on full scale composite beams with web openings. All beams had ribbed slabs using formed steel deck. Ribs were perpendicular to or parallel to the steel section. The effects of moment-shear ratio, partial composite construction, deck rib orientation, slab thickness, opening shape, opening eccentricity, and modification of the deck over the opening are studied. A strength model and three versions of a practical design technique are developed. The peak loads attained by composite beams with ribbed slabs at web openings are governed by the failure of the slab. Rib failure occurs in slabs with transverse ribs, while longitudinal shear failure occurs in slabs with longitudinal ribs. First yield in the steel around the opening does not give an accurate indication of the section capacity. The strength model and the design techniques accurately predict the strength of composite beams at web openings for beams with solid or ribbed slabs. GRA

FINITE ELEMENT FRACTURE ANALYSIS ON MICROCOMPUTER
J. W. Bryson and B. R. Bass 1986 20 p Presented at conference
(Contracts DE-AC05-84OR-21400; NRC-40-551-75; NRC-40-552-75)
(TI86-006214; CONF-860722-4) Avail: NTIS HC A02/MF A01

The ORVIRT.PC microcomputer program enables one to perform finite element fracture analysis on either an IBM PC/AT or PC/XT. When used together with its companion automatic mesh generation program, ORMGEN.PC, a complete fracture analysis consisting of mesh generation, stress analysis, and fracture analysis

can typically be performed in 30 to 45 minutes. ORVIRT.PC is a stand alone finite element program with the capability to carry out two dimensional linear thermoelastic stress and fracture mechanics analyses. ORVIRT.PC utilizes a virtual crack extension technique that was modified to include thermal strains. While this approach reduces identically to the J-integral for 2-D problems, it offers an advantage in application and programming effort over the latter when thermal loadings are considered. Sample problems are provided demonstrating that an accuracy better than 1% can be obtained with ORVIRT.PC. System requirements are an IBM PC/AT or PC/XT, 512K minimum memory, hard disk, math compressor, and IBM Professional FORTRAN Compiler. Author

Data acquisition, initial site characterization, image and geographic information methods available, and brief evaluations of first-year for NASA's Thematic Mapper (TM) working group are presented. The TM and other spectral data are examined in order to relate local, intensive ecosystem research findings to estimates of carbon cycling rates over wide geographic regions. The effort is to span environments ranging from dry to moist climates and from good to poor site quality using the TM capability, with and without the inclusion of geographic information system (GIS) data, and thus to interpret the local spatial pattern of factors conditioning biomass or productivity. Twenty-eight TM data sets were acquired, archived, and evaluated. The ERDAS image processing and GIS system were installed on the microcomputer (PC-AT) and its capabilities are being investigated. The TM coverage of seven study areas were exported via ELAS software on the Prime to the ERDAS system. Statistical analysis procedures to be used on the spectral data are being identified. B.G.

Raw digital data, as received from the LANDSAT spacecraft,

cannot generate images that meet specifications. Radiometric corrections must be made to compensate for aging and for differences in sensitivity among the instrument sensors. Geometric corrections must be made to compensate for off-nadir look angle, and to calculate spacecraft drift from its prescribed path. Corrections must also be made for look-angle jitter caused by vibrations induced by spacecraft equipment. The major components of the LANDSAT ground segment and their functions are discussed. B.G.

TM BAND COMBINATION FOR CROP DISCRIMINATION
Sherry Chou Chen, Getulio T. Batista, and Antonio T. Tardin May 1986 7 p Presented at the International Symposium on Remote Sensity, Resource Development and Environmental Management, Eschede, Netherlands, 25-29 Aug. 1986
(INPE-3905-PRE/946) Avail: NTIS HC A02/MF A01

The LANDSAT Thematic Mapper provides not only more spectral bands but also improved spatial resolutions in the visible and infrared wavelengths as compared to MSS data. However, working with the increased number of wavelength bands presents problems. To learn better how to analyze TM data for agriculture studies, LANDSAT data of a 15x15 Km area in Parana State, Brazil, were acquired on Jan. 19, 1985. The predominant crops were soybeans, corn, and sugarcane. To choose the best combination of the three TM bands to use, the entropy criterion was used. The colors green, red and blue were associated with them according to the magnitudes of their variances to form the color composite. Interpretability of these color images were evaluated visually. For digital analyses the criterion of the Jeffreys-Matusita distance was applied to verify the best band combination if 2,3,4 or 5 TM bands were used. A classification algorithm based on the maximum likelihood decision rule was then employed to classify the study area using the designated TM bands. Classification performances were compared pixel-by-pixel on alphanumeric printouts, the computer time consumed, the classification matrices and the upper bounds of the probability of error. After these analyses, the TM bands which should be used for an effective digital analysis of this agricultural scene were decided.

Several hardware, software, and data collection problems encountered were conquered. The Geographic Information System (GIS) data from other systems were converted to ERDAS format for incorporation with the image data. Statistical analysis of the relationship between spectral values and productivity is being pursued. Several project sites, including Jackson, Pope, Boulder, Smokies, and Huntington Forest are evolving as the most intensively studied areas, primarily due to availability of data and time. Progress with data acquisition and quality checking, more details on experimental sites, and brief summarizations of research results and future plans are discussed. Material on personnel, collaborators, facilities, site background, and meetings and publications of the investigators are included. B.G.

AN ECOLOGIC STUDY OF PEAT LANDFORMS IN CANADA AND ALASKA Progress Report
Paul H. Glaser 1986 9 p
(Contract NAS5-28740)
(NASA-CR-179740; NAS 1.26:179740) Avail: NTIS HC A02/MF A01 CSCL 08B

The role of groundwater and surface runoff in controlling the water chemistry and development of peat landforms in northern Minnesota are described. The LANDSAT imagery taken during spring break-up are particularly valuable in identifying potential zones of groundwater discharge. The vascular floras of raised bogs in eastern North Americas demonstrating the remarkable uniformity of the ombrotrophic flora over broad geographic regions are described. The evolution of peat landforms in the major boreal peatlands of eastern America is examined. The LANDSAT imagery is used to determine the area of patterned to featureless peatlands, the area of ombrotrophic bog relative to minerotrophic fen, and the relative size and degree of streamlining of island landforms entirely composed of peat. Such measurements can be used to assess the role of climate, time, and hydrology in controlling the formation of peatland patterns across broad geographic regions. B.G.

Spectral relationships were investigated for several bare soil fields which were in summer fallow rotation on the date of the imagery. Printouts of each band were examined and compared to aerial photography. Bands with dissimilar reflectance patterns for known areas were then combined using ratio techniques which were proven useful in other studies (Williams, 1983). Selected ratios were Thematic Mapper (TM) 1/TM4, TM3/TM4, and TM5/TM4. Cluster analyses and Baysian and Fastclass classifier images were produced using the three ratio images. Plots of cluster analysis outputs revealed distinct groupings of reflectance data representing green crops, ripened crops, soil and green plants, and bare soil. Bare soil was represented by a line of clusters on plots of the ratios TM5/TM4 and TM3/TM4. The soil line was investigated further to determine factors involved in the distributin of clusters alone the line. The clusters representing the bare soil line were also studied by plotting the Tm5/TM4, TM1/TM4 dimension. A total of 76 soil samples were gathered and analyzed for organic carbon. Author

The combinations of Thematic Mapper (TM) bands that best distinguish basalts of the Brooks Range ophiolites were determined. Geochemical analyses, including major, trace, and rare earth elements (REE), are being done in order to study the significance of TM spectral variations that were observed within some of the sampled rock units. An image of the topography of the western Brooks Range and Colville Basin was constructed. Elevation data for the rest of Northern Alaska are being acquired to expand the area covered by the topography image. Two balanced cross sections (one along the eastern margin, the other along the western margin of the Brooks Range) are being constructed, using the techniques of fault-bend and fault-propagation folding. These are being used to obtain regional shortening estimates for the Brooks Range in an attempt to constrain tectonic models for the evolution of Northern Alaska. The TM data are being used to confirm reconnaissance maps and to obtain structural data where no maps exist. Along with the TM data, digital topography, seismic reflection

profiles, and magnetic and gravity surveys are examined to better understand the evolution of the Colville Basin, north of the Brooks Range. B.G.

ENVIRONMENTAL PROCESSES AND SPECTRAL REFLECTANCE CHARACTERISTICS ASSOCIATED WITH SOIL EROSION IN DESERT FRINGE REGIONS Semiannual Report
P. A. Jacobberger 11 Aug. 1986 53 p
(Contract NAS5-28774)
(NASA-CR-179729; NAS 1.26:179729) Avail: NTIS HC A04/MF A01 CSCL 08M

Two Thematic Mapper (TM) scenes were acquired. A scene was acquired for the Bahariya, Egypt field area, and one was acquired covering the Okavango Delta site. Investigations at the northwest Botswana study sites have concentrated upon a system of large linear (alab) dunes possessing an average wavelength of 2 kilometers and an east-west orientation. These dunes exist to the north and west of the Okavango Swamp, the pseudodeltaic end-sink of the internal Okavango-Cubango-Culto drainage network. One archival scene and two TM acquisitions are on order, but at present no TM data were acquired for the Tombouctou/Azaouad Dunes, Mali. The three areas taken together comprise an environmental series ranging from hyperarid to semi-arid, with desertization processes operational or incipient in each. The long range goal is to predict normal seasonal variations, so that aperiodic spectral changes resulting from soil erosion, vegetation damage, and associated surface processes would be distinguishable as departures from the norm. CHARACTERIZATION AND DISCRIMINATION OF SELECTED VEGETATION CANOPIES FROM FIELD OBSERVATIONS OF BIDIRECTIONAL REFLECTANCES M.S. Thesis
Sheila Donovan 1985 163 p
(Contract NCC5-26)
(NASA-CR-179837; NAS 1.26:179837) Avail: NTIS HC A08/MF A01 CSCL 02C

A full evaluation of the bidirectional reflectance properties of different vegetated surfaces was limited in past studies by instrumental inadequacies. With the development of the PARABOLA, it is now possible to sample reflectances from a large number of view angles in a short period of time, maintaining an almost constant solar zenith angle. PARABOLA data collected over five different canopies in Texas are analyzed. The objective of this investigation was to evaluate the intercanopy and intracanopy differences in bidirectional reflectance patterns. Particular attention was given to the separability of canopy types using different view angles for the red and the near infrared (NIR) spectral bands. Comparisons were repeated for different solar zenith angles. Statistical and other quantitative techniques were used to assess these differences. For the canopies investigated, the greatest reflectances were found in the backscatter direction for both bands. Canopy discrimination was found to vary with both view angle and the spectral reflectance band considered, the forward scatter view angles being most suited to observations in the NIR and backscatter view angles giving better results in the red band. Because of different leaf angle distribution characteristics, discrimination was found to be better at small solar zenith angles in both spectral bands. Author

REMOTE SENSING OF EARTH TERRAIN Semiannual Report, 1 Mar. - 31 Aug. 1986
J. A. Kong Oct. 1986 11 p
(Grant NAG5-270)
(NASA-CR-177185; NAS 1.26:177185) Avail: NTIS HC A02/MF A01 CSCL 05B

The Mueller matrix and polarization covariance matrix for polarimetric radar systems were studied. The clutter is modelled by a layer of random permittivity, described by a three dimensional correlation function, with variance, and horizontal and vertical correlation lengths. This model is applied, using the wave theory with Born approximations carried to the second order, to find the backscattering elements of the polarimetric matrices. It is found that 8 out of 16 elements of the Mueller matrix are identically zero, corresponding to a covariance matrix with four zero elements. Theoretical predictions are matched with experimental data for vegetation fields. A general mixing formula is derived for discrete scatterers immersed in a host medium. The inclusion particles are assumed to be ellipsoidal. The electric field inside the scatterers is determined by quasistatic analysis, assuming the diameter of the inclusion particles to be much smaller than the wavelength. The results are applicable to general multiphase mixtures. Author

RELATIONSHIP BETWEEN THE SOUTHERN OSCILLATION EL NINO AND RAINFALL IN SOUTH AMERICA, AFRICA, INDIA, AUSTRALIA AND NEW ZEALAND
R. P. Kane Oct. 1986 66 p Submitted for publication Sponsored in part by Fundo de Nacional Desenvolvimento Cientifico e Tecnologico
(INPE-4005-PRE/998) Avail: NTIS HC A04/MF A01

The relationships between various indices of the Southern Oscillation (SO), El Nino and rainfalls in S. America, Africa, India, Australia and New Zealand are studied. The various SO indices are very well intercorrelated. El Ninos occur if the SO index is very low in the early part of the year. However, correlations with rainfall at most of the above locations (including NE Brazil) are loose, almost nonexistant, except for India and Victoria. For these, the relationship is one-sided i.e., most of the SO/El Nino are associated with droughts; but many droughts are not associated with SO/El Nino, thus severely limiting their prediction potential. Global circulations have an influence only occasionally, and the various rainfalls seem to be mostly influenced by local or semi-global circulation patterns, a study of which may lead to short-term predictions, with an antecedence of a few months. For some rainfall series, significant, prominent periodicities exist in the long periodicity region. In such cases, a study of time series seems to have prediction potentials. Author

THE BRAZILIAN SATELLITE REMOTE SENSING
M. N. Barbosa and D. Bastos-Netto Oct. 1986 21 p Presented at the International Conference on Remote Sensing for Development, Berlin, West Germany, 1-7 Sep. 1986
(INPE-4006-PRE/999) Avail: NTIS HC A02/MF A01

Almost twenty years since the first use of Remote Sensing techniques in Brazil, a review of the results achieved and a plans for the future are made, in accord with the aims and priorities of the new Brazilian Administration. Conscious of this spirit, INPE has revised its ongoing projects and established a new, goal-oriented organization structure. After one year of work, some achievements are already available and are presented in this paper. The analysis of these preliminary results, in conjunction with governmental priorities and the state-of-the-art at the international level, will serve as a guide in the years to come. Author

RESEARCH IN EXPERT INTERACTIVE CARTOGRAPHIC SYSTEMS Final Report, 13 May 1985 - 13 May 1986
Andrew J. Hanson 11 May 1986 68 p
(Contracts DACA72-85-C-0008; DA Proj. 854-5)
(AD-A168337; ETL-0417) Avail: NTIS HC A04/MF A01 CSCL 09/4

Applications of interactive expert system techniques to the domain of automated cartography were studied in the context of the SRI Image Understanding Testbed, extended to include Symbolics Lisp Machines and the SRI ImagCalc(TM) software support system. As a sample domain, we chose to work mainly

on the problem of locating generic cultural objects in aerial imagery. The discovery of such objects was accomplished by defining a generic model for rectilinear objects, along with rules for parsing the image geometry and correcting probable errors of the segmentation algorithm. These tools permit the semantic resegmentation of an initial syntactic scene partition to yield well-delineated buildings. The method owes its success to the combined utilization of both high-level and low-level knowledge about the target object context and the image. GRA

TECHNIQUES TO IMPROVE ASTRONOMIC POSITIONING IN THE FIELD
Angel A. Baldini Dec. 1985 55 p
(AD-A168347; ETL-0400) Avail: NTIS HC A04/MF A01 CSCL 08/5

New methods and techniques for improving astronomic positioning in the field are discussed. Latitude and longitude are obtained by observing transit times of pairs of stars over a fixed vertical plane, independent of azimuth and zenith distances. A unique solution is derived for each pair. Higher accuracy in latitude can be obtained by observing transit times of star pairs over the prime vertical, where the parallactic angle reaches its maximum value. The vertical plane of observation can be fixed within 90 arc seconds with respect to the prime vertical without changes in the star's parallactic angle, and a function of it, the latitude, can then be computed. The star transit times over different vertical lines are thereby reduced to the central line or collimation plane, as a function of the parallactic angle. Higher accuracy in longitude can be achieved by observing the transit times of pairs of stars over a vertical plane fixed within 20 arc minutes with respect to the meridian plane. Each individual star pair will determine a solution. Since each pair does not depend on azimuth orientation, the star pairs can be chosen arbitrarily with respect to declination or zenith distance, and short periods of clear sky observations can be utilized. When several pairs are observed an adjustment can be carried out through the equations of conditions that allow one to detect errors in either the transit times or in the star's right ascensions. TWO-DIMENSIONAL POLYGONAL REPRESENTATION OF MAPS FOR USE WITH AUTONOMOUS VEHICLE ROUTE PLANNING
Roger K. Diehl, Robert B. McGhee, and Michael J. Zyda Jun. 1986 85 p
(AD-A170301; NPS52-86-016) Avail: NTIS HC A05/MF A01 CSCL 08/2

We present in this study a two-phase approach to the generation and maintenance of a polygonal cartographic database useful for autonomous vehicle route planning. The database is generated non-interactively from available U.S. Geological Survey topographical maps. The database is maintained interactively by a graphics workstation. The focus of this study is on the non-interactive generation of the polygonal database. The non-interactive generation process uses both a set of heuristics derived from the characteristics of paper maps and classical region growing. This study presents a two-phase approach to the digital map production problem. The first phase is a non-interactive phase in which general information is gleaned from a paper topographical map with the use of an image digitizer and computer vision software. The second phase is an interactive one that focuses on the refinement, correction and revision of the map produced in the first phase. GRA

TELEDETECTION BY AQUATIC PLANTS. INVESTIGATION OF THE POSSIBILITIES OF MULTISPECTRAL PHOTOGRAPHY AND SPECTRORADIOMETRY [TELEDETECTIE VAN WATERPLANTEN. EEN ONDERZOEK NAAR DE MOGELIJKHEDEN MET MULTISPECTRAAL FOTOGRAFIE EN SPECTRORADIOMETRIE]
K. Philippart Aug. 1985 66 p In DUTCH
(VLT-1985-11; VN-809; ETN-86-98066) Avail: NTIS HC A04/MF A01

The possibilities of teledetection of aquatic plants using multispectral photography and spectroradiometry were assessed. The multispectral photography was performed in natural conditions in the green, red, and near IR wavelength range. The results are unsatisfactory; no correlation between reflection and biomass is found. The spectroradiometry was performed in a laboratory; the reflection spectrum of the object was determined by measuring the intensity in the range between 400 and 800 nm every 10 nm. The effect of the biomass and the degree of vegetation on the reflection are determined. Spectroradiometry gives good results; aquatic plants have a specific reflection spectrum. ESA

WEST-3 WIND TURBINE SIMULATOR DEVELOPMENT
J. A. Hoffman and S. Sridhar Jul. 1985 236 p
(Contracts DEN3-247; DE-AI01-76ET-20320)
(NASA-CR-174983; DOE/NASA/0247-3; NAS 1.26:174983; PPI-FID-300086-Vol-3) Avail: NTIS HC A11/MF A01 CSCL 10A

The software developed for WEST-3, a new, all digital, and fully programmable wind turbine simulator is given. The process of wind turbine simulation on WEST-3 is described in detail. The major steps are, the processing of the mathematical models, the preparation of the constant data, and the use of system software generated executable code for running on WEST-3. The mechanics of reformulation, normalization, and scaling of the mathematical models is discussed in detail, in particular, the significance of reformulation which leads to accurate simulations. Descriptions for the preprocessor computer programs which are used to prepare the constant data needed in the simulation are given. These programs, in addition to scaling and normalizing all the constants, relieve the user from having to generate a large number of constants used in the simulation. Also given are brief descriptions of the components of the WEST-3 system software: Translator, Assembler, Linker, and Loader. Also included are: details of the aeroelastic rotor analysis, which is the center of a wind turbine simulation model, analysis of the gimbal subsystem; and listings of the variables, constants, and equations used in the simulation. SUMMARY ASSESSMENT OF SOLAR THERMAL PARABOLIC DISH TECHNOLOGY FOR ELECTRICAL POWER GENERATION
P. L. Penda, T. Fujita, and J. W. Lucas 15 Sep. 1985 126 p
Sponsored in part by DOE
(JPL Proj. 5105-161)
(NASA-CR-179920; DOE/JPL-1060/89; JPL-Pub-85-55; NAS 1.26:179920) Avail: NTIS HC A07/MF A01 CSCL 10B

An assessment is provided of solar thermal parabolic dish technology for electrical power generation. The assessment is based on the development program undertaken by the Jet Propulsion Laboratory for the U.S. Department of Energy and covers the period from the initiation of the program in 1976 through mid-1984. The program was founded on developing components and subsystems that are integrated into parabolic dish power modules for test and evaluation. The status of the project is summarized in terms of results obtained through testing of modules, and the implications of these findings are assessed in terms of techno-economic projections and market potential. The techno-economic projections are based on continuation of an evolutionary technological development program and are related to the accomplishments of the program as of mid-1984. The accomplishments of the development effort are summarized for each major subsystem including concentrators, receivers, and engines. The ramifications of these accomplishments are assessed in the context of developmental objectives and strategies. Author

HIGH ENERGY ELECTRON RADIATION DEGRADATION OF GALLIUM ARSENIDE SOLAR CELLS M.S. Thesis
Don W. Gold Mar. 1986 137 p
(AD-A168402; NPS-72-86-001) Avail: NTIS HC A07/MF A01 CSCL 10/2

A need existed to perform high energy electron irradiation experiments on gallium arsenide solar cells. To support this research, an automated solar cell test facility was constructed, gallium arsenide solar cells were obtained, and the Naval Postgraduate School LINAC facility was utilized to irradiate the cells to selected fluence levels at 20 MEV energies. Equivalent damage coefficients were calculated, and it was found that the average maximum power output decreased by 50% following a cumulative irradiation by electrons to a total fluence of 1 X 10 to the 15th power sq. cm. RESEARCH ON HIGH-EFFICIENCY SINGLE-JUNCTION MONOLITHIC THIN-FILM AMORPHOUS SILICON SOLAR CELLS Annual Report, 1 Dec. 1984 - 30 Nov. 1985
F. E. Aspen, D. P. Grimmer, R. L. Jacobson, F. R. Jeffrey, and N. T. Tran Apr. 1986 144 p
(Contract DE-AC02-83CH-10093)
(DE86-004453; SERI/STR-211-2924) Avail: NTIS HC A07/MF A01

This report presents results of one year of research on high-efficiency, single-junction, monolithic, thin-film amorphous silicon solar cells. This work consists of five research tasks: (1) amorphous silicon materials, (2) nonsemiconductor materials, (3) solar cells, (4) monolithic, intraconnected cells/submodules, and (5) multichamber deposition systems. The primary goal is to advance the state of the art of flexible thin films using glow-discharge deposition methods. Among other accomplishments, a multichamber deposition system has been installed that can deposit all three p-i-n layers continuously and sequentially, and these layers have demonstrated good IV characteristics. OPTIMIZATION OF p-CuInSe SUB 2/n-CdZnS SOLAR CELLS Final Subcontract Report, 15 Apr. 1984 - 30 Sep. 1985
R. W. Birkmire May 1986 19 p
(Contract DE-AC02-83CH-10093)
(DE86-010700; SERI/STR-211-2931) Avail: NTIS HC A02/MF A01

This research was conducted to fabricate CuInSe2/CdS solar cells on well-characterized CuInSe2 single-crystal wafers in order to improve our understanding of thin-film polycrystalline devices. CuInSe2 wafers were supplied to the Institute of Energy by K. Bachmann of North Carolina State University. CdS was deposited onto the wafers to make CuInSe2/CdS heterojunctions. Some wafers were treated in a Se atmosphere to lower the resistivity and to homogenize properties through the wafer. Not all wafers were single-crystal. The wafers were characterized in terms of resistivity, carrier type, composition and crystallographic structure. The CuInSe2/CdS cells had efficiencies over 4% and open-circuit voltages over 0.45 V. The number of wafers and their quality limited the device performance achievable in this work. DOE

Photovoltaic power system technology is experiencing very rapid development. In order to maintain a current understanding of the status of this technology, the Photovoltaic Technology Evaluation Project conducts an on-going program of evaluating PV hardware at the component, subsystem, and full power system levels. This paper describes: the evaluation of PV power system performance for several major PV installations in the US; recent results from the component and subsystem evaluation activities in our Photovoltaic Advanced Systems Test Facility (PASTF); and development and application of PV power system models to better understand PV power systems' performance. HC A02

Thermochemical transport of solar energy based on reversible chemical reactions may be a way to take advantage of the high-temperature capabilities of parabolic dishes, while minimizing pipe network heat loss, since energy is transported at ambient temperatures in chemical form. Receiver/Reactor design is a key to making thermochemical transport a reality. In this paper the important parameters for solar receiver and chemical reactor design and how they relate to each other are presented. Three basic receiver/reactor types, applicable to thermochemical receiver design, are identified, i.e.: (1) tube receiver/reactors have tubular reactor elements which are directly heated by solar energy in the receiver; (2) indirect receiver/reactors use an intermediate heat transfer fluid between the receiver and reactor; and, (3) direct absorption receiver/reactors absorb sunlight directly on the reactor catalyst. Advantage, limitations, and risks associated with each design are discussed and examples of those that have been built are given. Each type offers its own set of advantages and risks, and warrant further investigation. DOE

MEASUREMENT OF RADIATION INTENSITY AT THE SOLAR TOWER PLANT SSPS/CRS OF THE IEA IN SPAIN
Andreas Brinner Jan. 1986 42 p Transl. into ENGLISH from "Strahlungsintensitaets-Messung am Solarturmkraftwerk SSPS/CRS der IEA in Spanien" Stuttgart, West Germany Original language document was announced as N86-15739
(ESA-TT-961; DFVLR-FB-85-36; ETN-86-98246) Avail: NTIS HC A03/MF A01; original German version avail. at DFVLR, Cologne, West Germany DM 15

The Kendall MK9 radiometer was selected to measure the radiation intensity on the IEA SSPS/CRS solar tower plant in Spain. The measuring signal was applied to calibrate a video camera used for measurement of power density distribution in the aperture of the solar absorber. The measurement results were used to show a relationship between the gray values of a video picture of the ASR receiver under radiation and the absolute radiation intensity measured at three points so as to calculate the absolute irradiation in MW. The tests show good reproducibility and high accuracy. The conversion factors were applied to calculate the flux distribution, the maximum flux and the ASR receiver efficiency. ESA

CONTROL OF WIND POWER STATIONS WITH VARIABLE VELOCITY IN A LARGE RANGE
Bjoern Jakobsson and Eskil Ulen Jun. 1986 92 p In SWEDISH; ENGLISH summary
(FOA-C-20613-E3; ISSN-0347-3694; ETN-86-98326) Avail: NTIS HC A05/MF A01

Wind turbine control was performed by keeping the velocity ratio optimal up to a certain torque. At higher wind speed the turbine speed is allowed to augment at constant torque, to produce more power. When maximum speed is obtained, a blade regulation is inserted: adjustment to optimal speed is done by feedforward control. A torque (dependant on rotor speed) is imparted to the shaft by an electric control. The turbine then goes to the right speed. ESA

PROGRESS IN CALCULATION METHODS FOR EIGENFREQUENCIES [VOORTGANG IN DE BEREKENINGSMETHODES VOOR DE EIGENFREQUENTIES]
P. A. Joosse Dec. 1985 48 p In DUTCH
(IW-M505; ETN-86-98486) Avail: NTIS HC A03/MF A01

Methods to calculate the uncoupled eigenfrequencies of a (rotating) beam used in wind turbines are described. Improvements in the determination of the flexibility matrix do not lead to an appreciably higher accuracy. The Southwell coefficients deduced from the eigenvibration form are sufficiently accurate. The determination of the bar diagram (rotating eigenfrequencies versus rotor speed) via the nonrotating bending frequency and the Southwell coefficients results in a good approximation which can be used to find the occurrence of interferences. The drag and torsion frequencies are determined with an accuracy comparable to that of the flap frequency. The calculation methods allow the determination of all uncoupled rotor eigenfrequencies. The short calculation time and the accuracy of these methods make them very suitable for parameter variations in the predesign phase. ESA

(Contract NAS9-17536)
(NASA-CR-179901; NAS 1.26:179901) Avail: NTIS HC A02/MF A01 CSCL 13B

The requirements which would result in identifying the components of an automatic analytical system for the analysis of specific organic compounds in the space station potable water supply are defined. The gas chromatographic system for such an analysis is limited to commercially available off-the-shelf hardware and includes the sample inlet, an ionization detector, capillary columns as well as computerized compound identification. The sampling system will be a special variation of the purge and trap Tenax mode using six-port valves and a 500 microliter water sample. Capillary columns used for the separating of contaminants will be bonded phase fused silica with a silicone stationary phase. Two detectors can be used: photoionization and far ultraviolet, since they are sensitive and compatible with capillary columns. A computer system evaluation and program with the principle of compound identification based on the retention index is presented. Author

A STUDY OF THE RADIATION BALANCE OF THE AMAZON FOREST [UM ESTUDO SOBRE O BALANCO DE RADIACAO DA FLORESTA AMAZONICA]
Antonio Ocimar Manzi, Yelisetty Viswanadham, Leonardo Deaned-eAbreuSa, and Romisio Geraldo Bouhid Andre Jul. 1986 20 p In PORTUGUESE; ENGLISH summary Presented at the Workshop on GTE/ABLE-2A, Sao Jose dos Campos, Brazil, 3-7 Feb. 1986 (INPE-3956-PRE/974) Avail: NTIS HC A02/MF A01

This work illustrates the behavior of the various components in the radiation balance and two different parameters which are useful statistical and descriptive indexes of net and solar radiation over natural surfaces like the Amaxon tropical rain forest. The experimental site is located at 2 deg 57 min S 59 deg 57 min W in the Ducke Reserve Forest, 25km from Manaus. Local day time data for non-precipitation days during the observation period 23rd July to 22nd August 1984 were selected for analysis. The radiation balance equation was analyzed for different atmospheric humidity conditions. Values of the heating coefficient beta and the longwave radiation exchange coefficient lambda are calculated. The results showed that the absolute value of the parameter beta decreases with relative humidity, whereas the parameter lambda increases.

INVESTIGATION ON ACIDITY-FORMING IONS IN WET AND DRY DEPOSITION DURING THE WINTER SEASON 1984/85
Monika Paffrath Mar. 1986 72 p In GERMAN; ENGLISH summary
(DFVLR-FB-86-15; ISSN-0171-1342; ETN-86-98183) Avail: NTIS HC A04/MF A01; DFVLR, Cologne, West Germany DM 23.50

The concentrations of the most important acidity-controlling ions, namely sulfate, nitrate, chloride, H(+), and ammonia, were systematically measured in rain, snow, fog, and dry depositions. The measuring and analysis methods included ion chromatography, photometry, and pH-measurements. The results show that the sulfate, nitrate, and ammonia ions dominate, and that dry depositions can be neglected. The mole ratio of nitrate to sulfate in wet depositions is 1 to 0.6. The investigation of correlations between ion deposition rates and wind direction shows that the highest pollutant contribution (SO2, NOx) comes mainly from the west with high precipitation rates. Chlorides come mainly with maritime air masses from the west. Strong monthly variations are observed.

(PB86-205465; EPA-600/D-86-107) Avail: NTIS HC A02/MF A01 CSCL 13B

A nationwide network of regionally located Standard Reference Photometers (SRP) for the assay of ozone concentrations has been established to allow state and local air monitoring agencies to compare their ozone standards with authoritative standards maintained and operated under closely controlled conditions. The SRP was developed by the National Bureau of Standards and the Environmental Protection Agency (EPA) as a highly stable, highly precise, computer-controlled instrument for the assay of ozone concentration. EPA's Environmental Monitoring System Laboratory at Research Triangle Park, N. C. is operating an SRP network in cooperation with EPA Regional Office or State Agencies. Currently, network sites are located in RTP, NC; Edison, N.J.; Chicago, Ill; Houston, Tex.; Denver, Col.; and Sacramento, Calif. Each network SRP was fabricated and certified by the NBS before deployment and is recertified annually by EPA. To date 86 comparisons of local 03 standards have been performed with the network SRP's. Of the 55 verifications of local 03 primary standards conducted, 46 comparison results (84%) were within the acceptable range (+ or - 3% agreement). Of the 31 verifications of local 03 transfer standards conducted, all 31 comparison results (100%) were within the acceptable range (+ or - 5% agreement) with 29 (94%) within + or - 3%.

A COMPARISON OF STRATOSPHERIC AEROSOL AND GAS EXPERIMENT 1 (SAGE 1) AND UMKEHR OZONE PROFILES INCLUDING A SEARCH FOR UMKEHR AEROSOL EFFECTS Ph.D. Thesis
Michael Joseph Newchurch 1986 305 p
Avail: Univ. Microfilms Order No. DA8612319

After briefly reviewing ozone depletion predictions from atmospheric models and results from trend analysis of Umkehr data, the Umkehr method for deducing the vertical profile of ozone is outlined. The theoretical and empirical studies of the aerosol effect on Umkehr measurements are reviewed. A brief description of the Stratospheric Aerosol and Gas Experiment 1 (SAGE 1) is followed by a method for approximating the best presentation of the conditions over the Umkehr ground site as seen by the SAGE 1 satellite.

(Contract NAS5-28765)
(NASA-CR-179738; NAS 1.26:179738) Avail: NTIS HC A03/MF A01 CSCL 08G

Surface coatings on volcanic rock assemblages that occur at select tertiary volcanic centers in southern Nevada were investigated using LANDSAT 5 Thematic Mapper imagery. Three project sites comprise the subject of this study: the Kane Springs Wash, Black Mountain, and Stonewall Mountain volcanic centers. LANDSAT 5 TM work scenes selected for each area are outlined along with local area geology. The nature and composition of surface coatings on the rock types within the subproject areas are determined, along with the origin of the coatings and their genetic link to host rocks, geologic interpretations are related to remote sensing units discriminated on TM imagery. Image processing was done using an ESL VAX/IDIMS image processing system, field sampling, and observation. Aerial photographs were acquired to facilitate location on the ground and to aid stratigraphic differentiation. E.R.

Nonlinear Electromagnetic (EM) wave interactions with the upper atmosphere were investigated during the period 15 December 1985 to 15 June 1986. Topics discussed include: the simultaneous excitation of ionospheric density irregularities and Earth's magnetic field fluctuations; the electron acceleration by Langmuir wave turbulence; and the occurrence of artificial spread F. The role of thermal effects in generating ionospheric irregularities by Whistler waves, intense Quasi-DC electric fields, atmospheric gravity waves, and electrojets was investigated. A model was developed to explain the discrete spectrum of the resonant ultralow frequency (ULF) waves that are commonly observed in the magnetosphere. Author

TECTONIC EVALUATION OF THE NUBIAN SHIELD OF NORTHEASTERN SUDAN USING THEMATIC MAPPER IMAGERY Interim Report
Aug. 1986 101 p Original document contains color illustrations Sponsored by NASA
(NASA-CR-177045; NAS 1.26:177045; IR-2) Avail: NTIS HC A06/MF A01 CSCL 08G

Bechtel is nearing completion of a one-year program that uses digitally enhanced LANDSAT Thematic Mapper (TM) data to compile the first comprehensive regional tectonic map of the Proterozoic Nubian Shield exposed in the northern Red Sea Hills of northeastern Sudan. The status of significant objectives of this study are given. Pertinent published and unpublished geologic literature and maps of the northern Red Sea Hills to establish the geologic framework of the region were reviewed. Thematic mapper imagery for optimal base-map enhancements was processed. Photo mosaics of enhanced images to serve as base maps for compilation of geologic information were completed. Interpretation of TM imagery to define and delineate structural and lithogologic provinces was completed. Geologic information (petrologic, and radiometric data) was compiled from the literature review onto base-map overlays. Evaluation of the tectonic evolution of the Nubian Shield based on the image interpretation and the compiled tectonic maps is continuing. Author

(Contract F19628-82-C-0048)
(AD-A168523; SSI-TR-89; AFGL-TR-85-0319) Avail: NTIS HC A04/MF A01 CSCL 04/1

A detailed Monte Carlo simulation of the flow within an ion sampling mass spectrometer is described. The simulation includes effects of non equilibrium flow and acceleration due to electric fields. A scheme for proton hydrate reactions is presented, including estimations of rate constants for agglomeration of H2O onto positive ion clusters and lifetimes of the resulting complex. Complexes can be collisionally excited or stabilized within the model. Test calculations are performed for altitudes of 30 and 38 km. No significant effect of agglomeration of H2O onto ion clusters was predicted in either case, but collisional excitation and subsequent dissociation of clusters was found to be a potentially severe problem. Diffraction effects in complicated geologic and topographic structures of interest to the Air Force Geophysics Lab. were investigated. This report examines diffraction by reentrant corners, i.e., corners with included angle greater than 180 degrees, which idealize the abrupt topographic relief commonly found at the base of escarpments and mesas. Reentrant landforms are also common in tectonic regions, and include fault scarps and other block joints. Approximating these regions of high curvature by perfect edges defines so-called generalized models--where curvature is concentrated at singular points (corners) on the free-surface. Diffraction from a single corner is studied in detail. Effects of more realistic distributed curvature in local and regional models will be examined in subsequent reports. The principal tool for the study is finite element modeling, since no mathematical solutions presently exist for P-SV wave edge diffraction in even the simplest geologic diffractors. Diffraction of plane P- and SV-waves and a Rayleigh wave are calculated for various reentrant wedges. This necessary emphasis on numerical simulation is balanced by a mathematical analysis of self-similar vector wave diffraction theory. The analysis yields a formal reduction of the general problem to a system of singular integral equations. The resulting integral expressions provide a new calculational basis for solutions to a variety of diffraction problems in mathematical physics. GRA

HC A02/MF A01 CSCL 04/2

Numerical and theoretical studies of internal gravity waves have been performed to understand the role of convective instabilities in nonlinear, large amplitude gravity waves; the effects of saturation and self acceleration on transient gravity wave, mean flow interaction; the role of local convective instabilities in producing turbulent modifications of potential temperature and trace constituents in breaking gravity waves; and the propagation and refraction of inertial and non inertial gravity waves through observed middle atmosphere wind fields. Simulations with a two dimensional, nonhydrostatic gravity wave model indicate that convective adjustment in unstable gravity waves results in a mean flow modification closely approximated by WKB saturation theory in cases where the incident wave field is nearly monochromatic. Convection also limits, and practically prevents, the evolution to a reflecting nonlinear critical layer, even when the incident wave field is not monochromatic. Some critical layer dislocation is observed due to self acceleration in transient gravity waves. Localization of turbulence in a convectively unstable gravity wave can greatly reduce the mixing of heat and trace constituents and implies a large turbulent Prandtl number. Significant lateral movement and refraction of gravity wave rays is observed for inertia gravity waves in realistic wintertime flows. A formula is derived for the onset of dynamical instability in inertia-gravity waves, having a lower threshold than the corresponding amplitude required for convective instability. GRA

CSCL 04/1

Plasma waves observed during the March 12, 1985, AMPTE magnetotail barium release are described. Electron plasma oscillations provided local measurements of the plasma density during both the expansion and decay phases. Immediately after the explosion the electron density reached a peak of about -40000/cc and then started decreasing approximately as t to the -2.4 power as the cloud expanded. About 6 minutes after the explosion the electron density suddenly began to increase, reached a secondary peak of about 240/cc, and then slowly decayed down to the pre-event level over a period of about 15 minutes. The density increase is believed to be caused by the collapse of the ion cloud into the diamagnetic cavity created by the initial expansion. The plasma wave intensities observed during the entire event were quite low. In the diamagnetic cavity electrostatic emissions were observed near the barium ion plasma frequency, and in another band at lower frequencies. A broadband burst of electrostatic noise was also observed at the boundary of the diamagnetic cavity. Except for electron plasma oscillations no significant wave activity was observed outside of the diamagnetic cavity. GRA

Measurements of the solar resource have long been made with pyranometers and pyroheliometers. Few, however, have attempted to measure the resource with any appreciable spectral resolution. Several of the solar technologies that could use a spectral data base are described. This is followed by an explanation of how the atmosphere affects the transport of extraterrestrial solar radiation. Present attempts to model these atmospheric effects and current measurement plans for obtaining minimal data base of low spectral resolution data are presented. Finally, suggestions for improving the current state of spectral resource assessment are offered. DOE

GEOCHEMISTRY AND ORIGIN OF REGIONAL DOLOMITES Annual Progress Report, 26 Jul. 1985 - 25 Jul. 1986
G. N. Hanson and W. J. Meyers Apr. 1986 26 p
(Contract DE-FG02-85ER-13416)
(DE86-012788; DOE/ER-13416/1) Avail: NTIS HC A03/MF A01

Our studies have included petrographic and geochemical studies of the major generations of glauconite, dolomite and calcite cements, and the shales within the mid-Mississippian Burlington-Keokuk Formations exposed over an area of 80,000 sq km in Iowa, Illinois, and Missouri. Timing based on petrographic relations shows that Dolomite I and possibly II and the four oldest calcite cements formed before the development of paleokarst features during the Pennsylvanian and the oldest dolomite and calcite cements pre-date Mississippi Valley type mineralization, which may have developed in the Pennsylvanian or Permian. Significant differences are observed in the isotopic compositions of C, O, and Sr, as well as in Sr abundances in the different generations of dolomite. The earliest dolomite has C, O, and Sr isotope values close to the range expected for dolomite precipitated in seawater during Osagean time. The later dolomites have higher 87Sr/86Sr ratios, lower d18O and similar d13C values. A major advance is the development of quantitative models for evaluating the simultaneous changes in C, O, and Sr isotopes and trace element abundances in the carbonates and aqueous fluids during diagenesis. These models are now being applied to interpreting the evolution of the fluids responsible for the diagenesis of the Burlington-Keokuk carbonates. DOE

A STUDY IN THE VARIATION IN ATMOSPHERIC TRANSMISSION OF DIFFERENT TEMPERATURE BLACKBODY SOURCES IN THE 3.85 - 4.85 MICRON WAVEBAND
G. Bishop Mar. 1984 11 p
(BAe-BT-16208; LR50172; ETN-86-97975) Avail: NTIS
HC A02/MF A01

The variation in atmospheric transmission with altitude from four different spectral sources was examined. The sources were considered blackbody radiators at temperatures of 300, 600, 900, and 2000 K. Altitudes were ground level, 3, 6, 9, and 12 Km. Results clearly illustrate the altitude dependence in atmospheric transmission across the 3.85 to 4.85 micron band, because the transmission of infrared radiation through the atmosphere strongly depends upon the concentration of water vapor and carbon dioxide. As the altitude increases the atmospheric absorption bands caused by these species become narrower due to the reduced pressure, and thus the transmission over a fixed path length increases. There is also a slight increase in transmission with altitude due to the decrease in atmospheric temperature. A pronounced carbon

dioxide absorption band is centered at 4.3 microns. Its width is reduced at increased altitudes, leading to increased transmission across the defined band. ESA

PROJECT CONDORS: CONVECTIVE DIFFUSION OBSERVED BY REMOTE SENSORS Final Report
J. C. Kaimal, W. L. Eberhard, W. M. Moninger, J. E. Gaynor, and S. W. Troxel Jul. 1986 318 p Sponsored by EPA
(PB86-222221; EPA-600/3-86-040) Avail: NTIS HC A14/MF A01 CSCL 04A

Results from two diffusion experiments conducted at the Boulder Atmospheric Observatory (BAO) in 1982 and 1983 are given. The objective was to compare diffusion in the atmospheric convective boundary layer with that observed in laboratory tank experiments and numerical computer models. In both experiments at the BAO, two different tracers, oil fog and aluminized chaff, were released simultaneously and traced by lidar and radar, respectively, for periods up to two hours. In 1982, both tracers were released from the same surface or elevated point; in 1983, the two were also released from separate levels, the oil fog from near the surface, the chaff from an elevated point on the tower. The 1983 experiment included tracer gas releases with in situ samplers measuring surface concentrations downwind of the tower. The BAO tower provided data on the mean and turbulent state of the atmosphere, while mixing depths were monitored by balloon soundings, soda, lidar and radar. GRA

STUDY USING A THREE-DIMENSIONAL SMOG FORMATION MODEL UNDER CONDITIONS OF COMPLEX FLOW
S. Wakamatsu, K. L. Schere, J. H. Shreffler, and I. Uno May 1986 12 p Sponsored by EPA Prepared in cooperation with Institute for Environmental Studies, Tsukuba, Japan
(Grant EPA-R-812483)
(PB86-213246; EPA-600/D-86-116) Avail: NTIS HC A02/MF A01 CSCL 04A

To clarify the photochemical smog formation mechanisms under conditions of complex flow, the SAI Urban Airshed Model was evaluated using a 1981 field observed data base. In the Tokyo Metropolitan Area higher O3 concentrations are usually observed near the shore in the morning. As the sea breeze layer penetrates inland, this high concentration region travels with it, increasing in concentration with time. A night-time radiation inversion which persists into the early morning prevents the dispersion of primary pollutants emitted from the big coastal industrial zones and the Tokyo Metropolitan Area. The effect is believed to accelerate the formation of secondary pollutants during the next day. The quantitative role and weight of the previous days's secondary pollutants, newly emitted pollutants, temporal variation of mixing height and three-dimensional wind field for the O3 formation mechanisms were investigated. The three-dimensional simulated results showed good quantitative agreement with the observed field data but underestimated the aircraft data. GRA

AN ALTERNATE METHOD FOR DETERMINING ATMOSPHERIC STABILITY Ph.D. Thesis
Ruth L. Legg 1985 169 p
Avail: Univ. Microfilms Order No. DA8610369

A method is developed for determining the stability of the atmosphere that can be readily applied to diffusion modeling. The stability is related to the turbulence in the atmosphere, and the degree of turbulence generated by mechanical wind shear and surface heating can be approximated by the Obukhov length. Standard National Weather Service synoptic observations and other readily estimated factors are used to calculate an Obukhov length to estimate turbulence, and the Obukhov length is then categorized into standard Gaussian model stability classes. Climatological and other factors for each site, such as actual solar elevation angle, surface albedo, and moisture available for evaporation are included in the Obukhov estimation procedure. Since standard synoptic weather observations are used, no special instrumentation is required to make the estimates, and climatological data files can be used to calculate a stability climatology. The values of the Obukhov length and stability classes as determined by the derived technique were compared with results calculated using micrometeorological tower data. A high degree of correlation was present between the two methods. Stability climatology was calculated for a number of locations in various regions of the United States and the results compared with presently used EPA/STAR procedure results. The WSU procedure results seem to be in better agreement with basic climatology stability factors than are the EPA/STAR results. Dissert. Abst.

With the use of composite (non-metallic) and microelectronics becoming more prevalent in the construction of both military and commercial aircraft, the control systems have become more susceptible to damage or failure from electromagnetic transients. One source of such transients is the lightning discharge. In order to study the effects of the lightning discharge on the vital components of an aircraft, NASA Langley Research Center has undertaken a Storm Hazards Program in which a specially instrumented F106B jet aircraft is flown into active thunderstorms with the intention of being struck by lightning. One of the specific purposes of the program is to quantify the environmental conditions which are conductive to aircraft lightning strikes. Author

A case study analysis of the anvil top structure of a May 19,1984, thunderstorm was performed. Wind data were collected and plotted as time series of direction, horizontal velocity, and vertical velocity. A two-dimensional display of the horizontal winds along the flight track was also provided. The microphysical, dynamic, and thermodynamic characteristics of the overshooting tops and the downwind cirrus anvil top were studied. This included spatial and temporal distributions of cloud particle types and concentrations, horizontal and vertical wind in the cloud and its vinicity, and profiles of thermodynamic parameters. (Contract NAS8-35530)
(NASA-CR-4022; NAS 1.26:4022) Avail: NTIS HC A05/MF A01 CSCL 04B

A vertical velocity algorithm is developed which blends the strengths of two commonly used techniques, the O'Brien corrected kinematic method and the adiabatic method. The kinematic

method is based on mass continuity, and the adiabatic method is based on the First Law of Thermodynamics. By blending the methods using numerical variational analysis, a final vertical motion estimate is obtained processing information from diverse atmospheric processes. To assign the contribution of each method, a weighting function is constructed. The function weights between O'Brien corrected kinematic divergence values and the adiabatic estimate of vertical motion. Criteria are determined so that more influence is accorded to that estimate which better agrees with physical processes. This algorithm is tested with the AVE-SESAME I data set. The results show that the variational result in most cases succeeded in finding a compromise between the two techniques. A triumph of the algorithm is providing reasonable magnitudes of vertical velocity in the lower stratosphere. Author

MODIFICATION OF A VARIATIONAL OBJECTIVE ANALYSIS MODEL FOR NEW EQUATIONS FOR PRESSURE GRADIENT AND VERTICAL VELOCITY IN THE LOWER TROPOSPHERE AND FOR SPATIAL RESOLUTION AND ACCURACY OF SATELLITE DATA Final Report
G. L. Achtemeier Washington, D.C. NASA Oct. 1986 29 p
(Contract NAS8-36474)
(NASA-CR-4025; NAS 1.26:4025) Avail: NTIS HC A03/MF A01 CSCL 04B

Since late 1982 NASA has supported research to develop a numerical variational model for the diagnostic assimilation of conventional and space-based meteorological data. In order to analyze the model components, four variational models are defined dividing the problem naturally according to increasing complexity. The first of these variational models (MODEL I), the subject of this report, contains the two nonlinear horizontal momentum equations, the integrated continuity equation, and the hydrostatic equation. This report summarizes the results of research (1) to improve the way the large nonmeteorological parts of the pressure gradient force are partitioned between the two terms of the pressure gradient force terms of the horizontal momentum equations, (2) to generalize the integrated continuity equation to account for variable pressure thickness over elevated terrain, and (3) to introduce horizontal variation in the precision modulus weights for the observations. PRELIMINARY ESTIMATES OF RADIOSONDE THERMISTOR ERRORS
F. J. Schmidlin, J. K. Luers (Dayton Univ., Ohio.), and P. D. Huffman Washington, D.C. Sep. 1986 19 p
(NASA-TP-2637; NAS 1.60:2637) Avail: NTIS HC A02/MF A01 CSCL 04B

Radiosonde temperature measurements are subject to errors, not the least of which is the effect of long- and short-wave radiation. Methods of adjusting the daytime temperatures to a nighttime equivalent are used by some analysis centers. Other than providing consistent observations for analysis this procedure does not provide a true correction. The literature discusses the problem of radiosonde temperature errors but it is not apparent what effort, if any, has been taken to quantify these errors. To accomplish the latter, radiosondes containing multiple thermistors with different coatings were flown at Goddard Space Flight Center/Wallops Flight Facility. The coatings employed had different spectral characteristics and, therefore, different adsorption and emissivity properties. Discrimination of the recorded temperatures enabled day and night correction values to be determined for the US standard white-coated rod thermistor. The correction magnitudes are given and a comparison of US measured temperatures before and after correction are compared with temperatures measured with the Vaisala radiosonde. The corrections are in the proper direction, day and night, and reduce day-night temperature differences to less than 0.5 C between surface and 30 hPa. The present uncorrected temperatures used with the Viz radiosonde have day-night differences that exceed 1 C at levels below 90 hPa. Additional measurements are planned to confirm these preliminary results and determine the solar elevation angle effect on the corrections. The technique used to obtain the corrections may also be used to recover a true absolute value and might be considered a valuable contribution to the meteorological community for use as a reference instrument. ON THE ROLE OF MOIST BAROCLINIC INSTABILITY IN THE DEVELOPMENT OF POLAR LOWS AND COMMA CLOUDS
Jose Paulo Bonatti and V. Brahmananda Rao Aug. 1986 49 p Submitted for publication
(INPE-3971-PRE/984) Avail: NTIS HC A03/MF A01

The Mak parameterization of latent heat release is discussed using a finite difference version of a quasi-geostrophic beta-plane model. It is found that his analytical results can be well reproduced with 20-layer vertical resolution. This finite difference version can be used for observed (arbitrary) zonal wind and static stability vertical profiles with more realistic heating. This model with Chang profiles of heating is applied to the North Pacific polar lows studied by Mullen and to a subsynoptic scale (inverted) comma cloud system observed over Central South America. The principal features of these disturbances are reproduced by the model. Thus the generation mechanism of polar lows and comma clouds seems to be the baroclinic instability modified by the latent heat release. Author

CLEAR AIR TURBULENCE ANALYSIS USING ISENTROPIC METHODS M.S. Thesis
John H. Jacobson Mar. 1986 98 p
(AD-A168400) Avail: NTIS HC A05/MF A01 CSCL 04/2

Isentropic analyses were completed subjectively and by the Petersen (1986) objective analysis scheme for a 24-h Clear Air Turbulence (CAT) outbreak over the midwest United States. The purpose of the study is to determine if areas of high CAT potential could be identified by subjective isentropic analyses, and then by the automated analyses produced by the Petersen objective analyses. A background of CAT theory and current CAT forecasting techniques are also presented. The synoptic situation indicates the importance of the jet stream structure in this case. The study reveals that analyzed areas of low Ri and high wind shear correspond very well to reports of CAT. The objective analysis performance is fair overall. It shows a distinctive weakness in the analysis of the wind speed, occasionally producing spurious wind maxima. Analyses of the mass field, frontal slope and Montgomery stream function, are quite successful. GRA

WORLD ATLAS OF TOTAL SKY-COVER: ENVIRONMENTAL RESEARCH PAPERS
Charles F. Burger 4 Sep. 1985 120 p
(AD-A170474; AFGL-TR-85-0198; AFGL-ERP-927) Avail: NTIS

HC A06/MF A01 CSCL 04/2

The purpose of this atlas is to establish a global cloud climatology that details seasonal and diurnal variations. The Boehm Sawtooth Wave (BSW) simulation model is used to devise a method for describing the frequency distribution of total sky-cover. Two parameters, scale distance and mean sky-cover, permit the calculation of the sky cover distribution from clear to overcast. This is an efficient means of data storage, since two numbers define the entire frequency distribution. Hence, the frequency distribution of sky cover can be found for locations world-wide using the global analyses of mean sky cover and scale distance given in the atlas. Twenty maps are presented for each of these parameters - one set 4 times daily (0000-0200, 0600--0800, 1200-1400, 1800-2000 LST), for each midseason month (January, April, July, and October), and another set of monthly means for all hours for each midseason month. ANALYSES OF THE ATMOSPHERIC AEROSOL EXTINCTION IN THE 0.5 TO 14 MICRON REGION

Bertil Nilsson Apr. 1986 178 p

(FOA-C-30396-E1,E3; ISSN-0347-3708; ETN-86-97861) Avail: NTIS HC A09/MF A01

The relation between measured values of the aerosol extinction coefficient at various wavelengths and the simultaneous registered meteorological data was analyzed. Pronounced diurnal and annual variations of aerosol extinction are observed. A model for calculation of the aerosol extinction coefficient in IR wavelengths from meteorological data was tested. The model relates the IR extinction to visibility and to the IR/visible extinction ratio which can be derived from meteorological parameter values. Using the model, statistics of the IR aerosol extinction for various geographical regions and seasons of the year may be calculated from meteorological data. ESA

EQUATORIAL PACIFIC OCEAN CLIMATE STUDIES (EPOCS): PROGRESS AND PLANS

Oct. 1985 96 p

(PB86-213493) Avail: NTIS HC A05/MF A01 CSCL 04B

The ocean is a large and active reservoir of heat that determines many of the climatic attributes of the earth. An attractive approach to improving understanding and prediction of climate variation is investigation of the changes in oceanic heat storage, particularly in regions where the ocean most strongly effects the atmosphere. Interannual sea surface temperature variations which occur in the equatorial Pacific Ocean are the largest and most persistent observed anywhere. The coastal manifestation of the warm phase of these temperature anomalies, known as El Nino, was long identified with the disturbances to the oceanic ecosystem and rainfall pattern in Ecuador and Peru, with severe local and sometimes global consequences. THE DIRECT AND INDIRECT EFFECTS OF LATENT HEAT RELEASE ON EXTRATROPICAL CYCLONE DEVELOPMENT Ph.D. Thesis

Patricia Margaret Flaherty Pauley 1985 323 p

Avail: Univ. Microfilms Order No. DA8606598

The effects of latent heat release on the development of extratropical cyclones are proposed to be of two types, direct and indirect. The former is represented in diagnostic equations by any term which is expressed in terms of diabatic heating, while an indirect effect can occur through any of the other terms. The National Meteorological Center's LFM model is used to simulate a winter cyclone case over North America for varying conditions of latent heating. Direct effects were computed from model latent heating rates; indirect effects were found by comparing forecasts made with and without latent heating. The first diagnostic equation used was a new formulation of the height tendency equation called the extended height tendency equation. The extended equation is more general than the quasi-geostrophic form, using actual winds and vorticities in place of geostrophic, unsimplified coefficients, and two additional terms, the differential heating term, and the vertical advection of static stability term. Results of this diagnosis show that latent heat release indirectly alters height tendencies ahead of the cyclone by decreasing height falls due to vorticity advection, decreasing (increasing) height rises due to vertical advection of stability. The differential heating term, representing the direct effect of latent heating, was negligible when such heating was omitted from the forecasts but achieved values compartable to the other terms when the heating was included. This term yielded height falls at low levels and height rises at upper levels. Dissert. Abstr.

INVERSION OF OCEAN DATA Final Report
Manuelo Fiadeiro and George Veronis May 1986 10 p
(AD-A168676) Avail: NTIS HC A02/MF A01 CSCL 08/3

When we began our study of inverse procedures to determine ocean circulation, our intent was to build on past studies. It turned out, however, that much of the earlier work contained elements that were unclear so we were forced to begin again and to establish reliable and reproducible procedures. Our starting point was to accept the problem that Wunsch (1978) had posed and to sort out the methodology for solving it. We were able to derive an empirical search procedure that led to a level of no motion without requiring the mathematical apparatus of inverse theory. We obtained results for two data sets, one from the Tasman-Coral seas and one from the Bermuda Triangle. Since then several data sets that appeared at the outset to be appropriate for an inverse study have been examined. Lack of significant constraints seems to be characteristic of most oceanographic data sets which is not surprising since they were not gathered for the purpose of making the type of study we have undertaken. In most cases a traditional analysis with all its inaccuracies, assumptions and uncertainties provides as much information as one can obtain. Since our studies have indicated the need for additional considerations to constrain the system more effectively, we have formulated the problem of trying to determine the velocity field from tracer distributions. REAL TIME OCEANOGRAPHIC ANALYSIS FOR THE SOUTH WESTERN AUSTRALIAN AREA FOR JULY 1984 TO AUGUST 1985
L. J. Hamilton Dec. 1985 50 p
(AD-A168741; RANRL-TM-(EXT)-21/85) Avail: NTIS HC A03/MF A01 CSCL 08/10

Attempts made at real time oceanographic analyses for the south-western Australian area are shown diagrammatically in the form of contour maps. Results for the period July 1984 to August 1985 are discussed. It is concluded that with present data sources useful sea surface temperature analyses should be possible in late spring, summer, and perhaps early autumn, but not in winter, when cloud coverage severely hinders satellite data acquisition. Subsurface analyses were not possible; almost all data used were for the sea surface. GRA

SOLUTIONS IN STRAITS OF VARYING WIDTH AND DEPTH
D. David, D. Levi, and P. Winternitz 19 Jun. 1985 28 p Sponsored by Canadian Natural Sciences and Engineering Research Council, and Quebec's Gouvernement Fonds pour la Formation de Chercheurs et l'Aide a la Recherche, Canada
(Preprint-465; ETN-86-97900) Avail: NTIS HC A03/MF A01

In order to analyze data on the creation and propagation of large solitary waves in marine straits, a theoretical model extending previous one-dimensional models to the case of straits with varying width and depth, and nonvanishing vorticity, was developed. Starting from the Euler equations for a three dimensional homogeneous incompressible inviscid fluid, a generalized Kadomtsev-Petviashvili equation (GKP) together with its appropriate boundary conditions is derived in the quasi one-dimensional long wave and shallow water approximation. The coefficients of this equation depend on the form of the bottom and on the vorticity; the sides of the straits figure only on the boundary conditions. Under certain restrictions on the vorticity and the geometry of the straits the GKP is reduced to one of several completely integrable partial differential equations, in order to study the evolution of solitons which originate in the straits. Kersti Gustafsson, Pia Hallin, Eva Henningson, Gunilla Linfors, Lena Norlander, and Gunnar Sandstroem May 1986 31 p In SWEDISH; ENGLISH summary
(FOA-C-40229-B2; ISSN-0347-2124; ETN-86-98335) Avail: NTIS HC A03/MF A01; Research Inst. of National Defence, Stockholm, Sweden KR 50

A prototype detector for aerosols with bacteria was tested in different types of terrain where aerosols (with killed Escherichia coli) were generated. The investigation shows that the device detects increases in the total amount of bacteria in outdoor air (1 million bacteria/cc). The detection limit is high related to possible infection doses due to the high background level of outdoor air, but goes down in a cleaner environment. With an enzyme linked immunosorbal assay it is possible to identify the bacteria in the sampled aerosol and with filter hybridization an identification and an approximation of the number was made of bacteria on metal, cloth from uniforms, nitrocellulose filters, and water. PHILOSOPHICAL ASPECTS OF ADAPTATION THEORY c53
B. S. Alyakrinskiy *In its* USSR Report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, Mar. - Apr. 1986 (JPRS-USB-86-004) 23 Jul. 1986 p 1 - 14 Trans. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 2, Mar. - Apr. 1986 p 6-15 (For primary document see N87-12105 03-51)
Avail: NTIS HC A07/MF A01

The general concepts of the problem of adaptation are discussed from the dialectic point of view which, according to F. Engels, is the most important pattern of thinking in natural sciences. Dialectics provides an analog and therefore a method for interpreting developmental processes, universal relationships in nature, and transition from one area of research to another. From the point of view of dialectic laws adaptation acts as a contradictory process of habituation to various environments. The contradictory pattern of the adaptive process and its result is very distinct in terms of heredity and variability. A logical enlargement of the concept of adaptation is the transition to the study of homeostasis which is assumed to be its mechanism, a property which has developed in the course of evolution and fixed in heredity. This adaptive property is contradictory in its essence because homeostasis is a unity of stability and: instability, a fluctuating constancy. In addition to the law of constancy of the inner milieu, there is a law of homeostatic deviations. This concept can be understood through an analysis of the system theory that includes a continuous variation and conservation of structure which indicates its ordered oscillation, that is, its rhythmicity. This clarifies the relationship between homeostasis and biological rhythmicity as a method of maintaining the former. Thus, a consistent analysis of the problem of adaptation can help identify transition from one area of research to another, specifically to the study of oscillatory processes in living systems. RADIO-FREQUENCY ELECTROMAGNETIC RADIATION: RADIATION SAFETY c52
B. I. Davydov *In its* USSR Report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, Mar. - Apr. 1986 (JPRS -USB-86-004) 23 Jul. 1986 p 15 - 27 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, No. 2, Mar. - Apr. 1986 p 15-24 (For primary document see N87-12105 03-51)
Avail: NTIS HC A07/MF A01

Existing safety standards for electromagnetic radiation in the radio frequency range, including microwave radiation, adopted in the USSR, Great Britain, Poland, Czechoslovakia, USA, Canada, FRG and recommended by IRPA/INIRC are described. It is proposed to use the value 0.4 W/kg as the basic value of an absorbed dose rate which corresponds to the energy flux density 100 W/m(2) for frequencies over 2 GHz. The concepts of an effective dose rate and effective dose are discussed. Various questions of how to provide safety of those working with electromagnetic radiations are considered. Author

MATHEMATICAL MODELS OF FLUID-ELECTROLYTE METABOLISM c52
A. I. Grigoryev and V. V. Verigo *In its* USSR Report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, Mar. - Apr. 1986 (JPRS -USB-86-004) 23 Jul. 1986 p 28 - 32 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), Vol. 20, No. 2, Mar. - Apr. 1986 p 24-27 (For primary document see N87-12105 03-51)
Avail: NTIS HC A07/MF A01

Mathematical modeling of fluid-electrolyte metabolism and fluid homeostasis in real and simulated microgravity is discussed. At the first stage physiological reactions to provocative tests were simulated. The assumptions made yielded satisfactory results, particularly with respect to the excretion of the most important electrolytes in different time intervals of bed rest and recovery. The development of models of fluid homeostasis, taking into consideration tissue elasticity and plasticity and fluid buffering capacity, is discussed. Author

PRELIMINARY RESULTS OF MEDICAL INVESTIGATIONS DURING 5-MONTH SPACEFLIGHT ABOARD SALYUT-7-SOYUZ-T ORBITAL COMPLEX c52
Ye. I. Vorobyev, O. G. Gazenko, Ye. B. Shutzhenko, A. I. Grigoryev, A. S. Barer, A. D. Yegorov, and I. A. Skiba *In its* USSR Report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, Mar. - Apr. 1986 (JPRS-USB-86-004) 23 Jul. 1986 p 33 - 42 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), Vol. 20, No. 2, Mar. - Apr. 1986, p 27-34 (For primary document see N87-12105 03-51)
Avail: NTIS HC A07/MF A01

The medical examinations carried out in the 150-day flight were a continuation of previous studies in terms of the approaches and methods used. The novel approach was a biochemical study of body fluids collected during flight. An important place was occupied by medical monitoring and support performed during extravehicular activity (EVA). The medical results of the 150-day flight were consistent with the data obtained during previous spaceflights of similar duration. The health condition and work capacity of the crewmembers throughout the flight (including two EVA events) were good. The changes seen during and after flight were adaptive and disappeared after a relatively short readaptation period. Author

PROFESSIONAL WORK CAPACITY AND FUNCTIONAL STATE OF OPERATOR EXPOSED TO REPEATED OPTOKINETIC AND ANTIORTHOSTATIC FACTORS c54
L. N Komilova, L. D. Smirichevskiy, A. V. Trutnev, S. L. Chekanova, I. Ya. Yakovleva, and S. L. Kravchenko *In its* USSR Report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, Mar. - Apr. 1986 (JPRS-USB-86-004) 23 Jul. 1986 p 43 - 48 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), Vo. 20, No. 2, Mar. - Apr. 1986, p 35-38 (For primary document see N87-12105 03-51)
Avail: NTIS HC A07/MF A01

It has been shown that optokinetic stimulation that elicits sensory-autonomic manifestations of motion sickness and head-down tilt that simulates fluid redistribution in the cranial direction decrease professional abilities of the operator even after he has developed good skills. Repeated exposures to optokinetic stimulation or head-down tilt have some training effect. However, control tests that include both optokinetic stimulation and head-down tilt give evidence that their training effect is not adequate. Author

HUMAN HEART FUNCTION IN EARLY HOURS AND DAYS OF HEAD-DOWN TILT (ECHOCARDIOGRAPHIC DATA) c52
V. V. Bystrov, A. F. Zhemavkov, and A. A. Savilov *In its* USSR Report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, Mar. - Apr. 1986 (JPRS-USB-86-004) 23 Jul. 1986 p 54 - 60 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 2, Mar. - Apr. 1986 p 42-46 (For primary document see N87-12105 03-51)
Avail: NTIS HC A07/MF A01

Six healthy volunteers (aged 19 to 24) were exposed to head-down tilt (at 10 deg) for 7 days. The study revealed phasic changes of intracardiac circulation and the pump function which were not accompanied by contractility disorders. On the whole, the changes represented a manifestation of cardiovascular adaptation to hemodynamic shifts that are typical of this type of simulated weightlessness. The echocardiographic parameters varied similarly during the head-down tilt test and the joint Soviet-French experiment onboard Salyut-7. Author

HUMAN BLOOD FREE AMINO ACIDS AT EARLY STAGE OF HEAD-DOWN TILT c52
I. G. Popov and A. A. Latskevich *In its* USSR Report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, Mar. - Apr. 1986 (JPRS-USB-86-004) 23 Jul. 1986 p 61 - 70 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 2, Mar. - Apr. 1986 p 46-54 (For primary document see N87-12105 03-51)
Avail: NTIS HC A07/MF A01

The concentration of 17 free amino acids in plasma of 6 test subjects, aged 20, who were for 7 days exposed to head-down tilt and remained on a controlled diet, was measured. The study revealed an increase in the concentration of most amino acids by the end of day 3 and all amino acids by the end of day 7. This indicates that the diet used is a good source of the required amino acids and that there are processes which facilitate an increase of amino acids during the first days of exposure. The concentration of most amino acids returned to the baseline level on the 7th recovery day. Author

BLOOD SERUM ENZYME ACTIVITY IN HEALTHY MAN WITH SIMULATION OF EFFECTS OF WEIGHTLESSNESS c52
I. A. Popova *In its* USSR Report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, Mar. - Apr. 1986 (JPRS -USB-86-004) 23 Jul. 1986 p 71 - 75 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 2, Mar. - Apr. 1986 p 54-58 (For primary document see N87-12105 03-51)
Avail: NTIS HC A07/MF A01

The enzymic activity of blood of healthy male volunteers was examined during 8-day bed rest in the horizontal and head-down (-6 deg) position, water immersion up to the neck and 6-hour head-down tilt (-15 deg). Alkaline phosphatase, cholinesterase (CE), leucine arylamidase (LA), glutamate dehydrogenase (GDH) and gamma-glutamyl transpeptidase (GGTP) were measured. During horizontal bed rest the activities of all the enzymes, except for GDH, decreased in a moderate degree which was very distinct at an early stage of exposure. The activity of GDH and CE decreased significantly after the exposure. The enzymic activity tended to decline during head-down tilt at -6 deg. The LA and GGTP activity decreased to a greater extent, being statistically significant during head-down tilt at -6 deg and in the recovery period. The enzymic activity insignificantly increased during water immersion and 6-hour head-down tilt at -15 deg, remaining in some cases elevated during 5 days after exposure. The lower activity of enzymes (which was significant for some of them) during horizontal and antiorthostatic bed rest was primarily associated with diminished motor activity, whereas increased enzymic activity was related to the gravity-induced blood shift to the intrathoracic area. Author

PARAMECIUM TEST FOR TOXIC SUBSTANCES IN HUMAN BLOOD DURING SIMULATED WEIGHTLESSNESS c52
V. I. Lavrov, I. B. Goncharov, A. F. Davydkin, A. P. Ivanov, A. N. Romanov, and V. F. Ivchenko *In its* USSR Report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, Mar. - Apr. 1986 (JPRS-USB-86-004) 23 Jul. 1986 p 76 - 79 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 2, Mar. - Apr. 1986 p 58-60 (For primary document see N87-12105 03-51)
Avail: NTIS HC A07/MF A01

The paramecium test was used to measure the buildup of toxic substances in the healthy man exposed to simulated weightlessness. The most distinct changes were seen on bed rest days 3 and 7-8 in all test subjects (41 subjects). After bed rest day 8 the parameter reached a plateau, the toxicity level stopped increasing, but the paramecium test time remained shorter than normal. It can therefore be suggested that the prognosis of any disease that may develop in this situation will be worse. In view of this it is important to improve the prophylaxis and treatment of endogenous and exogenous intoxications during spaceflight and to provide active detoxication based on the purification of biological fluids by sorption. Author

TYPOLOGICAL CHARACTERISTICS OF CENTRAL HEMODYNAMICS OF MONKEYS IN CLINOSTATIC AND ORTHOSTATIC POSITIONS
A. N. Demin, G. S. Belkaniya, and V. A. Dartsmeliya *In its* USSR Report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, Mar. - Apr. 1986 (JPRS-USB-86-004) 23 Jul. 1986 p 80 - 86 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 2, Mar. - Apr. 1986 p 60 - 65 (For primary document see N87-12105 03-51)
Avail: NTIS HC A07/MF A01

By tetrapolar rheography central hemodynamics was investigated in 74 rhesus monkeys in the clino- and orthostatic state. The basic hemodynamic parameters were examined in relation to the entire sample, to the group with a higher or lower blood pressure, BP(mean), and to four states of central circulation in orthostatic animals. The typological circulatory differences in the orthostatic state were shown to be determined by qualitatively different hemodynamic mechanisms responsible for BP(mean). The hemodynamic characteristics in the clino- and orthostatic state were found to be reciprocally related. It is recommended to take into consideration the typological differences of hemodynamics that can modify cardiovascular responses to various effects. Author

DISTINCTIONS OF CAPILLARIZATION OF WHITE RAT SKELETAL MUSCLE DURING ADAPTATION TO HIGH ALTITUDE OF THE PAMIRS AND ANTARCTICA
V. Sh. Belkin and O. B. Astakhov *In its* USSR Report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, Mar. - Apr. 1986 (JPRS-USB-86-004) 23 Jul. 1986 p 87 - 92 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 2, Mar. - Apr. 1986 p 65 - 69 (For primary document see N87-12105 03-51)
Avail: NTIS HC A07/MF A01

The capillary-myofiber quantitative relations were examined morphometrically in 180 white male rats exposed for 1.5 months

to altitudes of 3488 to 4000 m above sea level (Antarctic and Pamir highlands). During the first three weeks of adaptation drastic changes in the parameter were seen. It is suggested that one of the factors responsible for them is a shift in the functional status of muscle produced by the method of transportation of the animals to the highland environments. EFFECT OF LONG-TERM STORAGE ON SOME PARAMETERS OF FAT INGREDIENT OF FREEZE-DRIED PRODUCTS c54
A. K. Sivuk, A. G. Kasatkina, Ye. I. Strukova, V. P. Naydina, and Ye. Ye. Zharkovskaya *In its* USSR Report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, Mar. - Apr. 1986 (JPRS-USB-86-004) 23 Jul. 1986 p 93 - 97 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 2, Mar. - Apr. 1986 p 69-72 (For primary document see N87-12105 03-51)
Avail: NTIS HC A07/MF A01

The effect of prolonged storage at the temperature 20 +/- 5 C and relative humidity 70 to 80% on the freeze-dried food products packed in a three-layer polymer was investigated. The organoleptic parameters, fat content and fat physicochemical properties were determined in the freshly prepared foods and foods stored for 6, 10 and 14 months. The fat component of cereals and vegetables was found to change during storage: the acid and peroxide numbers increased, products of secondary oxidation accumulated and nonsaturated fatty acids decreased. Among the foodstuffs examined the buckwheat cereal and mashed potatoes proved to be most stable and edible after 14 months of storage. Author

RECLAMATION OF WATER USED FOR WASHING BY MEANS OF REVERSE OSMOSIS DURING LONG-TERM SPACE-FLIGHTS c54
S. V. Polyakov, V. D. Volgin, Yu. Ye. Sinyak, Ye. D. Maksimov, and V. I. Novikov *In its* USSR Report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, Mar. - Apr. 1986 (JPRS-USB-86-004) 23 Jul. 1986 p 106 - 109 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 2, Mar. - Apr. 1986 p 78 - 80 (For primary document see N87-12105 03-51)
Avail: NTIS HC A07/MF A01

Experiments on the purification of wash water by means of reverse osmosis membranes MGA-100 were performed. The membrane selectivity with respect to the major components (catamine AB, amine oxide and sodium chloride) was close to 100% whereas membrane permeability was not lower than 70% that of distilled water. The results of a field study in which 330 l of repeatedly used wash water were reclaimed showed that reverse osmosis can be effectively employed for that purpose. Author

SANITARY AND MICROBIOLOGICAL ASPECTS OF CLOSED ENVIRONMENT OCCUPIED BY PEOPLE AND ANIMALS c54
V. M. Knyazev, V. I. Korolkov, A. N Viktorov, G. O. Pozharskiy, L. N Petrova, and V. P. Gorshkov *In its* USSR Report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, Mar. - Apr. 1986 (JPRS-USB-86-004) 23 Jul. 1986 p 110 - 113 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 2, Mar. - Apr. 1986 p 80-82 (For primary document see N87-12105 03-51)
Avail: NTIS HC A07/MF A01

Men and animals (dogs) shared an enclosed environment for 30 days. The microorganisms on their skin and in the air were examined. Specific attention was given to staphylococcal pathogens that are potential causal agents of infectious diseases in enclosed bioobjects. The data obtained suggested that conditional pathogens can be exchanged between men and animals sharing an environment and clarify the mechanism(s) of their transfer. The experimental results have been used to develop prophylactic measures against diseases caused by conditional pathogens among men and animals sharing an enclosed environment. Author

EFFECT OF HYDROCORTISONE ON OSTEOGENIC FUNCTION OF MOUSE BONE MARROW
T. Ye. Burkovskaya *In its* USSR Report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, Mar. - Apr. 1986 (JPRS-USB-86-004) 23 Jul. 1986 p 114 - 119 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 2, Mar. - Apr. 1986 p 83-86 (For primary document see N87-12105 03-51)
Avail: NTIS HC A07/MF A01

Bone marrow cells were implanted into the capsule of the kidney of mice which were then given intraperitoneal injections of hydrocortisone in the dose of 5 mg per animal. The drug influenced different stages of bone histogenesis in a different manner. The stage of onset of bone formation proved to be most sensitive, whereas the earlier and later stages were less sensitive to hydrocortisone. It is concluded that the target cells for hydrocortisone are osteoblasts at the stage of active synthesis of bone proteins rather than cell-precursors of osteogenesis. Author

DISTINCTIONS OF VISUAL MONITORING OF INSTRUMENT READINGS IN MANEUVERED FLIGHT c53
I. D. Malinin and V. A. Ponomarenko *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 1-6 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 4-8 (For primary document see N87-12124 03-51)
Avail: NTIS HC A08/MF A01

Visual monitoring of flight parameters in a maneuvering flight simulated by a pilot trainer was investigated. Eye movements were recorded using a Japanese cinecamera. It was concluded that visual monitoring and attention concentration included chained routes of predicted sequence which was determined by current events throughout the flight. The most interesting finding was that the chains of gazing switching between angular parameters of spatial position or parameters of pitch and roll flights included several components whereas the chains of gaze switching between one parameter of the angular position and one parameter of the trajectory control or between two parameters of the trajectory control included exclusively one component. Circular or closed routes of gaze switching and chained proper or open multicomponent routes were discriminated. In a complex flight the chained or circular routes between two parameters of the angular coordinates became longer. The microstructure of gaze switching within one indicator (air horizon) is described and important problems requiring further research are discussed. Author

CAPABILITIES OF ULTRASONIC METHODS OF EVALUATING HEMODYNAMICS OF CARDIOCEREBROVASCULAR SYSTEM c52
L. G. Simonov and M. S. Gelfenbeyn *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 7-19 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 8-16 (For primary document see N87-12124 03-51)
Avail: NTIS HC A08/MF A01

Ultrasonic methods used at present to evaluate hemodynamic parameters of different organs and velocity characteristics of circulating blood are reviewed. The ultrasonic methods make it possible not only to diagnose different vascular lesions but also to investigate the effects of unusual environmental parameters on the human body. A classification is given of the existing and advanced procedures based on ultrasonic location when applied to determine hemodynamic characteristics of the cardiocerebrovascular system. A description is presented of ultrasonic methods used in studying the heart (velocity characteristics of the circulation of cardioelements), brain (pulse oscillations of vessel blood filling in the cranial cavity) and large arteries (blood filling and blood flow velocity). PSYCHOPHYSIOLOGICAL ASPECTS OF COLOR-CODING OF FLIGHT AND NAVIGATION INFORMATION ON ONBOARD ELECTRONIC DISPLAYS c54
A. A. Oboznov, A. N. Boyarskiy, and S. I. Buturlin *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 20-24 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 16-19 (For primary document see N87-12124 03-51)
Avail: NTIS HC A08/MF A01

Psychophysiological characteristics of pilots were compared when they used a color or a black-and-white electronic indicator in simulating a landing approach on a pilot trainer. No significant differences were seen in the objective evaluations of the visual function or in the precision with which the prescribed flight profile was maintained. However, subjective preferences were given to the color indicator. When the task was more complex (simulation of the deviated landing course), the time spent on looking for significant symbols and on recovering the necessary course decreased, if the pilots used a color indicator. It is concluded that the use of a color indicator can be redundant in performing simple tasks and therefore indifferent for pilot activities but it can be useful in performing complicated tasks when the pilot has to make a precise and quick assessment of the situation. FORECASTING OPERATOR WORK CAPACITY DURING LONG-TERM CONTINUOUS WORK c53
A. K. Yepishkin and A. I. Skrypnikov *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 25-28 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 19-22 (For primary document see N87-12124 03-51)
Avail: NTIS HC A08/MF A01

It is shown that the work capacity of operators performing continuously for 46 hours can be predicted on the basis of their electroencephalogram (EEG) and heart rate (HR). It is found that a drastic decrease of work capacity is preceded by a 20 to 30% increase of low frequency (delta and theta) activity and a 15 to 40% decrease of high frequency (alpha and beta) activity as well as by a simultaneous decrease of HR. These changes were revealed 1 to 4 hours before changes in the operator's work capacity. Author

TOLERANCE TO +Gz ACCELERATIONS OF INDIVIDUALS OF DIFFERENT AGES OTHER THAN PILOTS c52
A. R. Kotovskaya, I. F. Vil-Vilyams, and V. Yu. Lukyanyuk *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 35-40 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 25-29 (For primary document see N87-12124 03-51)
Avail: NTIS HC A08/MF A01

Ninety-six healthy nonpilots, ages 21 to 50 years, were exposed to 228 rotations on a 7.25 m arm human centrifuge. The study demonstrated aged related changes in +Gz tolerance of 3 to 5 G (for 30 s). The subjects at the age 31 to 40 years showed the highest tolerance while the subjects at the age 21 to 35 and 46 to 50 years the lowest tolerance. Young subjects (21 to 25 years old) often developed an asthenic type of the systolic pressure reaction in the ear lobe and visual disorders whereas older subjects (46 to 50 years old) displayed cardiac arrhythmias, lower heart rate and delayed recovery of blood pressure after exposure. It was also found that 60 to 80% subjects aged over 40 well tolerated acceleration of up to 5 G and therefore can be viewed as potential candidates for cosmonauts. Author

VISUAL-OPTICAL ASSESSMENT OF THRESHOLDS OF OBJECT

DISTORTION DUE TO LENS DEFECTS IN FLAT GLASS OF VEHICLE CABINS c74

A. V. Lekarev *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 41-44 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 29-33 (For primary document see N87-12124 03-51)

Avail: NTIS HC A08/MF A01

It was shown experimentally that the threshold values of optical distortions of test objects projected by a collimator during binocular observation through the lens defects of vehicle transparencies depend on their dioptric value and sign, distance between the observer's eyes and the transparencies as well as on the angle of the latter. The experimentally derived dependence can be used to standardize optical parameters of vehicle transparencies.Author

USE OF GAS MIXTURES WITH HIGH OXYGEN AND CARBON DIOXIDE CONTENT TO NORMALIZE EXTERNAL RESPIRATION AND BLOOD ACID-BASE EQUILIBRIUM IN PRESENCE OF MUSCLE FATIGUE c52

N. A. Agadzhanyan, N. P. Krasnikov, and S. I. Naydich *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 45-51 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 32-37 (For primary document see N87-12124 03-51)

Avail: NTIS HC A08/MF A01

Use of gas mixtures containing 1% CO_2 + 35% O_2 and 35% O_2 in the air during a passive rest after a high workload led to the neutralization of acid metabolites and recovery of acid-base equilibrium. This was due to a greater oxygen consumption, retention of metabolic CO_2 in plasma and accumulation of endogenous CO_2 in body fluids.

USE OF CENTRAL ELECTROANALGESIA FOR FUNCTIONAL RECOVERY FROM MOTION SICKNESS c52

A. S. Nekhayev, V. D. Vlasov, and V. V. Ivanov *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 59-63 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no, 4, Jul. - Aug. 1986 p 42-44 (For primary document see N87-12124 03-51)

Avail: NTIS HC A08/MF A01

Central electroanalgesia (CEAN) is a technique that involves application of pulsating current to the central nervous system in order to enhance its tonicity recover autonomic equilibrium and to reduce parasympathetic cardiovascular reactions. In two experimental runs in which 9 volunteers participated the efficacy of CEAN is preventing motion sickness symptoms produced by Markaryan's test was studied. After two rotations repeated with a one-hour interval vestibular reactions persisted for 7 to 10 hours. CEAN had a positive effect: after a one-hour CEAN session applied between two rotations the tolerance time of the second rotation increased on an average by 76%. An additional exposure to CEAN after rotation eliminated almost completely the adverse effects of rotation and made effective the postrotation work. Due to CEAN parasympathetic reactions of the cardiovascular system typical of the postrotation recovery period were indistinct. These data suggest that CEAN is an effective method to be used to help a rapid recovery of the functional state of the human body during motion sickness.

BIOLOGICAL VALUE OF PROTEINS IN FOOD ALLOWANCE OF SALYUT ORBITAL STATION CREWS c54

V. P. Bychkov, T. F. Vlasova, V. N. Gryaznova, Ye. A. Sedova, A. K. Sivuk, V. A. Tretyakova, and A. S. Ushakov *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 64-69 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsin (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 44-48 (For primary document see N87-12124 03-51)

Avail: NTIS HC A08/MF A01

The biological value of the protein component of three modifications of the Salyut space diet was measured in laboratory studies and in simulated space flights. Three experimental runs of up to 68 days in duration were carried out on 20 volunteers. During the study the following parameters of protein metabolism were measured: total protein and protein fractions in serum; urea, uric acid and creatinine in blood; total nitrogen, urea, ammonia, uric acid and creatinine in urine. The results obtained showed that the diet modifications provided an adequate nutritional status and a normal level of the above parameters of protein metabolism.

EFFECT OF COAMIDE AND FOLICOBALAMIN ON ERYTHROPOIESIS UNDER NORMAL LIVING CONDITIONS AND DURING ANTIORTHOSTATIC HYPOKINESIA c52

R. K. Kiselev, A. M. Chayka, and V. I. Legenkov *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 70-75 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 48-53 (For primary document see N87-12124 03-51)

Avail: NTIS HC A08/MF A01

The study was performed on 41 healthy men, aged 19 to 40, who led a normal life or were exposed to short-term or long-term head-down tilts. The effectiveness of hemostimulants was determined with respect to hemoglobin, red blood cells or reticulocyte counts. Folicobalamine and coamide administration in therapeutic doses increased hemoglobin and reticulocyte blood levels in the ambulant subjects or those exposed to a 7-day head-down tilt. The effect was stable and persisted for 2 to 3 weeks after which the blood parameters returned to the pretest level. Folicobalamine administered at the final stage of 50-day head-down tilt facilitated partial recovery of hemoglobin during the study (which is very important) and rapid recovery after it. The objective and subjective tolerance of the drugs was good. It is therefore concluded that folicobalamine should be taken at the final stage of head-down tilt or spaceflight to alleviate readaptation to the normal environment.

HUMAN TOLERANCE TO HIGH-INTENSITY CONTACT HEAT ON INTEGUMENTAL SURFACE c52

A. P. Kozlovskiy and Ye. A. Lushchikov *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 76-79 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 53-55 (For primary document see N87-12124 03-51)

Avail: NTIS HC A08/MF A01

Significant heating of the thermoprotective suit leads to a rapid growth of the temperature of its inner layer which is in contact with the human body. Prediction of the allowable time of high

temperature exposure is important when evaluating safety parameters. The results of measuring the time during which the direct contact between cotton and wool clothes and the forearm skin can be tolerated is presented. The results describe the time and amplitude parameters of the maximally allowable heat exposure. They can be used in testing prototypes of the protective equipment and in selecting their thermophysical characteristics as applied to an extreme environment. Author

BEHAVIORAL REACTIONS OF ANIMALS EXPOSED TO SPACEFLIGHT CONDITIONS IN THE PRENATAL PERIOD
Z. I. Apanasenko, M. A. Kuznetsova, and V. Yu. Korotkova *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 55-60 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 55-60 (For primary document see N87-12124 03-51)
Avail: NTIS HC A08/MF A01

The Wistar female rats were flown on the biosatellite Cosmos-1514 during their pregnancy days 13 to 18. Offspring (at the age 1 to 3 months) of four of these rats were used to investigate their behavioral reactions in the open field and mazes of different design, food attraction being applied. Control rats of matched pregnancy term were kept either in a vivarium or in a biosatellite mockup where all flight factors, except for weightlessness, were simulated. It was found that exposure to weightlessness in the above intrauterine developmental period caused no serious changes in the behavioral reactions of rats during their postnatal development. The number of refusals and errors and the latency period were similar in the rats from the flight and control groups. Changes were seen only in fine behavioral regulation. The flown animals displayed a lower research activity in the open field, a longer time of search in the maze, a far longer time for grooming and a greater number of inadequate movements, and a stronger response to external inhibiting stimuli. These changes seem to be caused by a slight attenuation of the basic nervous processes (primarily, inhibitory) and a decrease of their balance and lability. These effects may be associated with an inhibitory influence of space flight factors on the maturation of cortical structures. Author

EFFECT OF WEIGHTLESSNESS ON RAT FETUS SKELETAL DEVELOPMENT
L. A. Denisova *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 87-91 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 60-63 (For primary document see N87-12124 03-51)
Avail: NTIS HC A08/MF A01

The size of the ossified areas of skeletal bones of fetuses of white rats flown onboard Cosmos-1514 during their pregnancy days 13 to 18 was compared to that of synchronous and vivarium controls. The effect of zero-g on the pregnant animals in the course of an active formation of fetal bones involved a distinct (13 to 17%) arrest of the development of nearly every area of the fetal skeleton. The signs of the arrest development were more manifest in less mature skeletal structures. Since the Ca-2 content was identical in the flight and control rats, it can be concluded that the inhibited ossification of the flight fetuses was produced by the impairment of mechanisms controlling Ca-2+ incorporation into the growing skeleton. The ossified areas in the skeleton of the flight newborns were significantly larger than those of the synchronous and vivarium controls. This means that during the re-adaptation period (pregnancy days 18 to 23) the inhibited ossification of the fetal skeleton was completely compensated and that the flight newborns (i.e., the rats whose prenatal development occurred in part in zero-g) were ahead of the controls with respect to the ossification rate. FUNCTIONAL STATE OF SOMATOTROPIC CELLS OF ADENOHYPOPHYSIS IN HYPOKINETIC RATS
Ye. I. Alekseyev *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 92-97 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 63-67 (For primary document see N87-12124 03-51)
Avail: NTIS HC A08/MF A01

Morphological and cytokaryometric examinations of the somatotropic cell population of the rat pituitary anterior lobe were performed on hypokinetic days 30, 90 and 165, and 60 days after 165-day hypokinesia (readaptation period). During prolonged hypokinesia the major changes occurred in the cytoplasm of somatotropic cells and were accompanied by an inhibition of the growth hormone synthesis. A higher activity of somatotropic cells during readaptation suggested that diminished motor activity may be responsible for a lower hormone production in the pituitary. The experimental findings and published data allow the conclusion that the inhibition of animal growth which takes place during hypokinesia is closely associated with an inhibited somatotropic function. NOREPINEPHRINE USED TO CONTROL ENERGY OF HEAT PRODUCTION AND UTILIZATION OF ATP IN SINGLE MUSCULAR CONTRACTION UNDER NORMAL AND HYPEROXIC CONDITIONS
L. D. Pchelenko *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 98-105 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 67-72 (For primary document see N87-12124 03-51)
Avail: NTIS HC A08/MF A01

The effect of noradrenalin (NA, 0.008 microgram/ml) on the rate of heat release (V) during a single isometric contraction of an isolated diaphragm was investigated in rats kept in air and 99% oxygen for 3 hours. The effect was measured by the electrothermometric method in the presence and in the absence of ATP (0.01 mg/ml) in the incubation solution. Hyperoxia doubled V of muscle contraction. The calorigenic effect of NA was not detected in the norm and was very distinct during hyperoxia so that V sub NA = 0.14 x V sub init + 10.88. ATP increased V both in the normal and hyperoxic state. However, the increase of the initial V level was 5.3-fold in the hyperoxic state and 1.5-fold in the norm. It is concluded that hyperoxia disturbs energy metabolism of muscle contraction through NA-dependent acceleration of ATP-lytic processes and increase in energy expenditures of heat formation in the course of muscle contraction. RELATIONSHIP BETWEEN CONSTITUTIONAL DISTINCTIONS AND FUNCTIONAL CHARACTERISTICS OF THE CARDIOVASCULAR SYSTEM OF HEALTHY SUBJECTS AND PATIENTS WITH HYPERTENSION IN CLINOSTATIC AND ORTHOSTATIC POSITION c52
G. S. Belkaniya and V. A. Dartsmeliya *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986

p 109-115 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 75-78 (For primary document see N87-12124 03-51)
Avail: NTIS HC A08/MF A01

The results are described of a correlation analysis of the relationship between the basic parameters of central hemodynamics (arterial pressure, cardiac output, stroke volume, peripheral vascular resistance) and primary somatometric characteristics carried out in 90 healthy subjects and 62 patients with arterial hypertension in the clinostatic and orthostatic position. In the orthostatic position the correlation between somatometric characteristics and hemodynamic parameters increased significantly in comparison to the clinostatic position. It is assumed that orthostatic characteristics of circulation are an adequate phenotypical manifestation of the human genotype as a biped living being.

SPECIALIZED EQUIPMENT FOR MAGNETIC RECORDING OF PHYSIOLOGICAL DATA FOR EXPERIMENTS ABOARD BIOSATELLITES c52
V. S. Magedov and Yu. S. Koryakov *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 116-119 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 79-80 (For primary document see N87-12124 03-51)
Avail: NTIS HC A08/MF A01

Large volumes of scientific information have to be recorded when conducting automated phyiological studies in biosatellites. The specificity of conditions of such investigations imposes size and weight restrictions on onboard equipment and precludes the possibility of servicing it during flight. The existing onboard magnetic recorders do not have a long enough continuous running time to record physiological data, and for this reason, it has become necessary to develop specialized magnetic recording equipment (MRE) that would service the purposes and conditions of long term experiments aboard biosatellites. Such equipment must provide for many hours of continuous recording of physiological information within a specified band of recorded frequencies, and limited size and supply of magnetic tapes. The main theoretical premises that enabled the development of a specialized MRE for continuous, long term recording of phsiological signals on magnetic tape. The method of frequency-modulated recording (FMR) was used in this equipment, since it permits maximum density of signal recording on the tape.

EVALUATION OF METHOD FOR COLLECTING AND CONCENTRATING ORGANIC TRACE IMPURITIES IN AIR c54
O. A. Sukhorukov, M. V. Azarova, and B. L. Avetisyants *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 120-124 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 81-83 (For primary document see N87-12124 03-51)
Avail: NTIS HC A08/MF A01

At the present time, in gas chromatography the limit of sensitivity of ionization detectors has been virtually reached, and further raising of the range of detection of trace impurities may proceed either in the direction of increasing the amount of trace impurities per unit sample volume fed to the input of an instrument, or by means of more efficient conversion of information in the course of measurement and data processing at different stages of analysis. Concentration is one of the ways of increasing information per unit sample volume. However, in the course of concentration there could be worsening of metrological characteristics of the analytical measurement process, and there could be increased loss of material due to irreversible adsorption on sorbents and interaction of impurities with one another. Then it becomes necessary to additionally purify the gases and reagents used. All this compels us to investigate more thoroughly the different stages of analysis of trace impurities in the method needed to examine contaminants in the environment and room air. Methods were evaluated of collecting and concentrating trace impurities from the air using a standard method of preparing them (diffusion through a capillary).

ENDOCRINE STATUS OF COSMONAUTS FOLLOWING LONG-TERM SPACE MISSIONS c52
N. F. Kalita and R. A. Tigranyan *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 125-128 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 84-86 (For primary document see N87-12124 03-51)
Avail: NTIS HC A08/MF A01

Spaceflights are associated with a set of stress factors that affect many systems of the body, in particular the endocrine system. The studies conducted to date yielded some information concerning the endocrine status of cosmonauts during and after spaceflights. At the same time, in spite of good physical training and conditioning of cosmonauts, individual changes may occur in the reactions of each of them in response to spaceflight factors, which are related to different characteristics, including psychological and age-related ones. For this reason, it is rather important to study the endocrine status of cosmonauts, since this would deepen our understanding of changes that take place in the body. The levels of a number of hormonal and biologically active compounds were examined in cosmonauts who had participated in long term (73 to 185 days) spaceflights and to demonstrate stressor reactions in the acute period of readaptation to Earth's gravity.

Kulayev *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 129-131 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 86-88 (For primary document see N87-12124 03-51)
Avail: NTIS HC A08/MF A01

There are only isolated publications in the literature that describe orthostatic reactions of heart rhythm in waking monkeys. The nature of the responses in those investigations could have been largely determined by an unstable heart rhythm associated with motor excitement of immobilized monkeys. The orthostatic cardiac rhythm response in waking monkeys was evaluated with consideration of this factor.

PROBLEMS OF AVIATION AND SPACE MEDICINE, BIOLOGY AND PSYCHOLOGY DISCUSSED AT FIFTEENTH GAGARIN SCIENTIFIC LECTURES c52
G. S. Ratner *In its* USSR Report: Space Biology and Aerospace Medicine (JPRS-USB-86-006) 8 Oct. 1986 p 132-144 Transl. into ENGLISH from Kosmicheskaya Biologiya i Aviakosmicheskaya Meditsina (Moscow, USSR), v. 20, no. 4, Jul. - Aug. 1986 p 88-94 (For primary document see N87-12124 03-51)
Avail: NTIS HC A08/MF A01

The 15th Gagarin Scientific Lecture Series took place from 1 to 10 April 1985. At the first session, one of the papers was delivered by Prof A. D. Yegorov under the title of Biomedical Problems of Long-Term Spaceflights. It dealt with analysis of biological mechanisms of effects of weightlessness and other spaceflight factors on man on the basis of summarization of the results of investigations and experience with spaceflights. The demonstrated patterns and recommendations developed on their basis made it possible to achieve records with regard to duration of human active performance in space. Two papers were delivered at the general meeting of this section, Problems of Aviation and Space Medicine and Psychology. USSR Cosmonaut-Pilot O. Yu. Atkov, candidate of medical sciences, told about the studies he conducted during the 237-day flight aboard the Salyut-7 orbital station. In all, more than 300 biomedical experiments referable to 34 projects were conducted.

TEMPORAL TUNING EFFECTS IN THE VISUALLY EVOKED RESPONSE M. S. Thesis - Houston U., Tex. Final Report

Ralph E. Parkansky (Houston Univ., Tex.) Aug. 1985 145 p (AD-A168219; NAMRL-MONOGRAPH-32) Avail: NTIS HC A07/MF A01 CSCL 06/16

Electrophysical and psychophysical evidence indicates that there are channels in the visual system that are more sensitive to either spatially-structured stimuli or luminance-modulated stimuli. This sensitivity or tuning was demonstrated by having the largest or optimum response produced by either spatially-structured or luminance-modulated stimuli. The purpose of this study is to determine if the steady-state visually evoked response to three stimuli is significantly and predictably altered by the choice of temporal frequency. It is expected that, for each observer, there will be an optimal temporal frequency or frequencies corresponding to a given pattern size, contrast and intensity. Also, this relationship will likely vary between individuals, but will remain relatively constant for a given observer over time. Three subjects were each presented with three stimuli. These stimuli were: (1) a square pattern of small checks where each check subtended 15 minutes of arc; (2) a square pattern of large checks where each check subtended 57 minutes of arc; and, (3) an unpatterned square stimul us. The check stimuli were presented in such a manner that alternate checks were 180 deg out of phase with each other and the unpatterned stimulus was presented as a luminance charge. GRA

RELATIONSHIP OF FIELD TESTS TO LABORATORY TESTS OF MUSCULAR STRENGTH AND ENDURANCE, AND MAXIMAL AEROBIC POWER

D. G. Bell and I. Jacobs Apr. 1986 22 p (AD-A168260; DCIEM-86-R-22) Avail: NTIS HC A02/MF A01 CSCL 06/18

This study evaluates the relationship between established laboratory tests of selected physical fitness components and a field tests battery (EXPRES) presently used annually to evaluate the physical fitness of Canadian Force personnel. Muscular strength, muscular endurance and maximal aerobic power were evaluated in 33 male personnel. The EXPRES test battery included isometric handgrip dynamometry as an indicator of strength, pushups and situps as indicators of muscular endurance, and maximal aerobic power was predicted from the heart rate response to a submaximal step-test. The laboratory measures of strength consisted of maximal isokinetic and isometric contractions of the body's large muscle groups performed on a computerized strength evaluation system. Maximal power generated during a 30 s cycle ergometer sprint (Wingate Test) was used as the laboratory measure of muscular endurance. Maximal aerobic power was measured directly during exhaustive cycle exercise. When correlation coefficients were calculated for the various field and laboratory tests, the values range from 0.46 - 0.67 for muscular strength, 0.49 - o.58 for endurance, and 0.65 for maximal aerobic power. All correlation coefficients were statistically significant (pless than 0.01), but the standard errors about the regression lines were quite large. GRA

OCULAR HAZARDS ASSOCIATED WITH LASER EXPOSURE Interim Report, Jan. - Dec. 1985

Harry Zwick and Joan Allen Mar. 1986 18 p (AD-A168506; LAIR-86-60) Avail: NTIS HC A02/MF A01 CSCL 06/18

In our experiments we have investigated the effects of low-level laser exposure on spatial vision measured in animal subjects. In monkeys trained to report minimal visual resolution as well as constrast thresholds for varying size targets (constrast sensitivity) we found that small spot (50 micron) exposure can significantly alter these measures of spatial vision. Such effects have both medical and tactical implications. Because such levels of exposure may produce prolonged change in spatial visual function even at levels below the maximum permissible exposure (MPE) level, the military medical community is faced with a dilemma that repeated exposure could result in considerable tissue destruction in non-regenerating neural retinal tissue long before any significant change in visual function is measurable. Long-term measurements of animal spatial vision has revealed subtle but significant evidence of visual function loss that is associated with low-level laser exposure to the fovea. Such effects may cause sufficient alterations to spatial vision to produce momentary distractions in co mplex military performance, such as target tracking. These potential hazards to human vision and visual performance have motivated development of human visual protective materials to counter low-level, multi-spectral laser exposure, as well as the development of new troop training strategies that should provide countermeasures through improved training scenarios. SLOWLY-DEVELOPING MODIFICATIONS IN CUTANEOUS CIRCULATORY CONTROL

C. B. Wenger May 1986 11 p (AD-A168702; USARIEM-M31/86) Avail: NTIS HC A02/MF A01 CSCL 06/16

The factors discussed below affect skin blood flow (SkBF) through nonthermal mechanisms. In considering them, however, it is necessary to account for thermoregulatory effects which may operate at the same time, because of the dominant role of the latter in the control of the SkBF. Therefore, these non-thermal factors will be approaches in terms of how they modify the relation of forearm blood flow (ABF), probably the most widely used index of SkBF, to the thermoregulatory signal, as represented by esophageal temperature (T sub es) when skin temperature is not changing. Slowly developing modifications may have time courses ranging from minutes (e.g., transcapillary fluid shifts, peripheral pooling of blood) through hours (e.g., circadian rhythms, dehydration) to weeks (e.g., exercise training, heat acclimation, menstrual cycle). Most of these factors change the threshold for vasodilation, but some also change the slope of the ABF:T sub es relation. Several of the factors that change the threshold for vasodilation likewise change thresholds for other thermoregulatory responses, such as sweating. If the operation of the thermoregulatory system as a whole is shifted to a different temperature level, such a shift represents a change in thermoregulatory set-point. Fever was probably the first condition to be recognized as resulting from a change in thermoregulatory set-point, and as expected, the threshold for forearm vascodilation is elevated in fever. GRA

BIOLOGICAL RHYTHMS AND ROTATING SHIFT WORK: SOME CONSIDERATIONS FOR AIR TRAFFIC CONTROLLERS AND MANAGERS Final Report

Carlton E. Melton and Robert S. Bartanowicz Jan. 1986 12 p (AD-A168742; DOT/FAA/AM-86/2) Avail: NTIS HC A02/MF A01 CSCL 06/16

This report is a general review of some of the current themes and practices regarding rotating shift work intended to inform air traffic controllers, technicians, and managers of these issues, and to offer some ideas that may be helpful in dealing with difficulties in this area. There is no pat or easy single solutions to the problems of every employee. Managers are always faced with difficult decisions, and shift work is one of the most difficult because it can become an emotionally charged issue. GRA

HUMAN EXERCISE AND HEAT EXCHANGE IN THERMAL

ENVIRONMENTS
Michael N. Sawka, Andrew J. Young, C. B. Wenger, and Kent B. Pandolf May 1986 12 p
(AD-A168746; USARIEM-M-35/86) Avail: NTIS HC A02/MF A01 CSCL 06/19

The thermal-physiological strain imposed by an exercise-environmental condition depends upon the individual's metabolic rate and the capacity for heat exchange with the environment. In hot environments, applied physiology issues concerning the capacity of humans to thermoregulate include the influence of an individual's acclimation state, aerobic fitness, hydration level, and circadian rhythms as well as the type of physical exercise performed. In cold environments, issues include further investigation of human cold acclimation, as well as the influence of body fat and exercise type on the resistance to hypothermia during cold water exposure. Emerging instrument/engineering technologies for the measurement of core temperature, sweating rate, skin blood flow and shivering offer promise for studying physiological responses in different environments. GRA

STRESS AND NEUROENDOCRINE REGULATION OF IMMUNE RESPONSES Annual Report, 30 Jun. 1985 - 31 Mar. 1986
Adrian J. Dunn and Nicholas R. Hall 20 Apr. 1986 15 p
(Contract N00014-85-K-0300; RR0-4108)
(AD-A168768) Avail: NTIS HC A02/MF A01 CSCL 06/19

Work is currently in progress on establishing a consistently reproducible paradigm for stress-induced immunosuppression in the mouse. Preliminary data indicate decreases in spleen and thymus weights, and in T-cell responsivity to mitogens following brief periods of restraint or electric footshock, especially with repeated treatments. Other preliminary data indicate that brain dopaminergic and noradrenergic systems respond acutely to the injection of a viral antigen (NDV), in addition to the previously reported increases in plasma corticosterone. The cerebral responses are particularly evident in hypophysectomized mice, in which we do not observe substantial increases in plasma corticosterone. We have not observed consistent changes in cerebral amines following injection of activated spleen cell supernatants, or thymosin fraction V (Tf-5). In a collaborative study, we found that Tf-5 does not directly alter corticosterone binding to its brain receptors, thus ruling out one potential mechanism for the anti-stress properties of Tf-5. CARBON DIOXIDE INCREASE AND HUMAN HEALTH: DATA AND RESEARCH REQUIREMENTS FOR DETERMINING CONSEQUENCES (INCLUDING A BIBLIOGRAPHY FOR ADDITIONAL READING)
M. R. White, I. Hertz-Picciotto, and M. E. Johnston May 1986 139 p
(Contract DE-AC03-76SF-00098)
(DE86-012760; LBL-21625) Avail: NTIS HC A07/MF A01

The purpose of this study was to determine the data and information needed to eventually define the consequences on human health of elevated C02. To attain this purpose, current knowledge of the effects of climate and weather on human health was reviewed. An increase in atmospheric CO2 is predicted to have several effects which may have an influence, directly and indirectly, on human health. These include climate change, changes in vegetation (due to changes in fertilization and water-use efficiency of plants), changes in ocean chemistry (due to increases in dissolved CO2), and possibly slight changes in human biochemistry and physiology (due to breathing air with elevated concentrations of CO2). This report describes some of the ways that climate and weather influence human health, some of the modifying factors, and the information and data needed to initiate studies of the possible consequences of elevated atmospheric CO2 on human health. RADIOFREQUENCY RADIATION: ACTIVITIES AND ISSUES
J. A. Elder Jul. 1986 12 p
(PB86-217155; EPA/600/D-85/135) Avail: NTIS HC A02/MF A01 CSCL 06R

The question of human safety relative to exposure to RF radiation obviously predates the first ANSI guide-line established in 1966, but no enforceable Federal standards or guidelines exist for RF radiation exposure; the ANSI guideline which was revised in 1982 is voluntary or advisory. EPA has been pursuing the goal of promulgating guidance to control exposure of the public to RF radiation. In support of the regulatory activity, a report entitled Biological Effects of Radiofrequency Radiation was published in September 1984. The conclusion of the report was that biological effects occurred at a dose rate of about 1 W/kg, and that these effects may be significant under certain environmental conditions. Examples of adverse biological effects that occur in laboratory animals at dose rates of 2-6 W/kg are death and temporary male sterility. These effects as well as the behavioral changes that are the basis for the ANSI guideline can be attributed to heat stress in animals caused by absorption of RF energy. Some experimental results occur at very low exposure conditions that cause no significant thermal input; these responses are called non-thermal effects. The mechanisms of interaction of non-thermal effects and their physiological significance are a subject of scientific debate. RF radiation research budget reductions, which reflect changes in funding priorities, will leave unresolved many of the questions concerning the biological effects of RF radiation and their possible health implications. GRA

EFFECTS OF MICROWAVE RADIATION ON THE BLOOD-BRAIN BARRIER
T. R. Ward, J. S. Ali, and M. D. Long May 1986 11 p
(PB86-213220; EPA/600/D-86/113) Avail: NTIS HC A02/MF A01 CSCL 06R

An attempt is made to repeat a portion of the study by Oscar and Hawkins in which pulsed and continuous wave microwave radiation increased permeation of labeled tracers through the blood-brain barrier. At the SAR used (0.1 W/kg) the calculated average brain temperature rise in less than 0.1c. The authors found no changes in permeation. However, there were differences in experimental conditions, including type of tracers, frequency and microwave field configuration. It is possible but unlikely that one of these differences is responsible for the apparent discrepancy in results. GRA

SKELETAL MUSCLE FATIGUE: PHYSIOLOGICAL AND BIOCHEMICAL STUDIES Ph.D. Thesis
Joseph Mark Metzger 1985 187 p
Avail: Univ. Microfilms Order No. DA8604956

In the context of this dissertation fatigue can be described as a transient decrease in muscle force generating capacity as a result of sufficiently intense or prolonged work. The diaphragm muscle was utilized as a model to study skeletal muscle physiology and biochemistry during fatiguing work. To address the question of diaphragm adaptability animals were exercise-trained on a treadmill using a high-intensity running protocol. Following training muscle glycogen content was elevated in the diaphragm. Despite this glycogen supercompensation, the fatiguability of the diaphragm was unchanged post training. During fatigue a high correlation existed between declining force and rising lactate. In order to accurately assess the role of acidosis on contractile function glass microelectrodes were constructed and used to determine pH alterations following fatiguing stimulation. It was demonstrated for the first time in mammalian muscles, using the direct microelectrode technique, that pH declines during intense contractile activity and returns to resting levels in a time course similar to the recovery of peak force. Moreover, it was demonstrated that, in contrast to previous reports, the decline in force during fatigue is not related to perturbation in membrane electrical properties. Finally, it was observed that following high and low frequency stimulation force production recovered faster at low compared to high frequencies.

Following stimulation, fusion at low frequencies increased due to fatigue induced prolongation of twitch duration. The net result being a leftward shift in the force-freqeuncy relationship thus augmenting force at low relative to high frequencies. Dissert. Abstr.

REGISTER OF RESEARCH IN PROGRESS ON MENTAL WORKLOAD
Thomas R. Metzler Feb. 1986 105 p
(AD-A168210; AAMRI-TR-86-007) Avail: NTIS HC A06/MF A01 CSCL 05/8

This report documents current research on operator workload. The register was compiled from responses to a questionnaire data form sent to 76 scientists who are active in basic and applied workload research. The six sections of the register include name and key term indexes, current project descriptions, listings of workload laboratories and potential sources of research support, and a bibliography of significant publications in the area.

DEVELOPMENT OF VISION TESTS FOR AIR-TO-AIR TARGET DETECTION Interim Report
W. A. Monaco, A. Morris, and P. V. Hamilton Jul. 1985 23 p
(AD-A168309; NAMRL-RR-1314) Avail: NTIS HC A02/MF A01 CSCL 06/16

This report summarizes the accomplishments leading to the development of a vision testing program currently being administered by the Naval Aerospace Medical Research Laboratory (NAMRL) at the Tactical Air Combat Training Systems; NAS, Oceana, VA. The program is designed to measure and suggest means to improve aircrew visual capabilities. Included in this report is a description of the methods used to select vision tests appropriate for determining the relationship between an individual's visual skill and his ability to detect targets in air-to-air engagements.

AN APPLICATION OF MULTIDIMENSIONAL SCALING TO

DESCRIBE STRESS AMONG NAVAL HELICOPTER PILOTS M.S. Thesis
Thomas L. Walston, III Mar. 1980 97 p
(AD-A168367) Avail: NTIS HC A05/MF A01 CSCL 06/19

The technique of multidimensional scaling is used in an attempt to determine any patterns utilized by Naval helicopter pilots when grouping a given set of stressors. Both grouping data and ranking data were collected and analyzed from a survey among pilots. Information gained through the ranking data consist of perceptions of the helicopter pilots on how the stressors affect certain performance aspects. Numerical output, as well as graphical plots, were generated to reflect these perceptions. Naval aviation, in general, is a high-stress environment. The variety of stresses associated with flying an aircraft have an impact on the effectiveness with which that task is performed. Helicopter flying has stressful situations, many of which, are unlike those of other aircraft. The missions, flight characteristics, and environment all contribute to these difficulties. It is important for the pilot to be aware of these stressful conditions in order to capably operate the helicopter GRA

EXTENDED ANALYSIS OF THE STRUCTURE OF ERROR SCORES IN PSYCHOLOGICAL APTITUDE TESTS
Klaus-Martin Goeters Oct. 1985 46 p Transl. into ENGLISH from "Erweiterte Strukturanalyse von Fehlerwerten in Psychologischen Leistungstests" Hamburg, West Germany Original language document was announced as N86-10780
(ESA-TT-943; DFVLR-FB-85-20; ETN-86-98241) Avail: NTIS HC A03/MF A01; original German version available at DFVLR, Cologne, West Germany DM 16.50

A series of psychological aptitude tests was analyzed with respect to human performance and reliability. A factor analysis of the test scores reveals five components of performance. Three independent error components are extracted: errors in quick visual detection of targets; difficulties in mental processing of numbers and symbols; and erroneous actions under performance stress. All three factors are the expression of a deficient control of performance. They are discussed as functional aspects of decision making and human information processing. ESA

PERFORMANCE REGULATION AND ERROR CONTROL IN A TEST OF PERCEPTUAL SPEED
Klaus-Martin Goerters Feb. 1986 41 p In GERMAN; ENGLISH summary
(DFVLR-FB-86-13; ISSN-0171-1342; ETN-86-98181) Avail: NTIS HC A03/MF A01; DFVLR, Cologne, West Germany DM 15

A test of perceptual speed (cancellation of figures) in which usually the number of rights and wrongs (omissions) are uncorrelated, was applied to three groups with different instructions. Group 1 was told to work quickly and accurately; group 2 to take care of the speed of work, and group 3 of accuracy. Subjects who where asked by a questionnaire about their attitudes during the work period and about their general style of work, emphasized the factors speed or accuracy while neglecting the other components. This procedure does not achieve the expected success. The result confirms the functional independence of speed of work and error rate in tests of mental concentration. ESA

THE VALUE OF GLOBAL SELF RATINGS IN DIFFERENTIAL DIAGNOSTICS Ph.D. Thesis - Hamburg Univ., West Germany
Peter Maschke Apr. 1986 229 p In GERMAN; ENGLISH summary
(DFVLR-FB-86-20; ISSN-0171-1342; ETN-86-98186) Avail: NTIS HC A11/MF A01; DFVLR, Cologne, West Germany DM 66.50

Reliability, validity, and faking tendencies of a 10 dimensional personality inventory were compared with the corresponding global self ratings in a situation of job application. Global self ratings do not appear to be faked more than the personality test scales. Although there are distinct differences in reliability between self rating and personality scales, the latter attain only negligibly higher validities. Reasons for these results (unexpected from assumptions of classical testing theory) are discussed. In relation to self ratings performance, there are indications of a capability of self assessment. THE SPACE STATION: HUMAN FACTORS AND PRODUCTIVITY
Douglas J. Gillan, Michael J. Burns, Clarence L. Nicodemus, and Randy L. Smith 1986 9 p
(Contract NAS9-15800)
(NASA-CR-179905; NAS 1.26:179905) Avail: NTIS HC A02/MF A01 CSCL 05H

Human factor researchers and engineers are making inputs into the early stages of the design of the Space Station to improve both the quality of life and work on-orbit. Effective integration of the human factors information related to various Intravehicular Activity (IVA), Extravehicular Activity (EVA), and teletobotics

systems during the Space Station design will result in increased productivity, increased flexibility of the Space Station systems, lower cost of operations, improved reliability, and increased safety for the crew onboard the Space Station. The major features of productivity examined include the cognitive and physical effort involved in work, the accuracy of worker output and ability to maintain performance at a high level of accuracy, the speed and temporal efficiency with which a worker performs, crewmember satisfaction with their work environment, and the relation between performance and cost. A HELICOPTER FLIGHT EVALUATION OF KINESTHETIC-TACTUAL DISPLAYS Interim Report
Alan M. Poston and Richard S. Dunn Mar. 1986 20 p
(AD-A168302; HEL-TN-3-96) Avail: NTIS HC A02/MF A01 CSCL 01/4

The kinesthetic-tactual (KT) display concept employs moveable elements incorporated in a pilot's flight control handgrips. A series of laboratory and simulator studies conducted since 1976 has shown that this touch-based display approach can substitute for visual displays or augment them in useful ways. This report describes the first helicopter flight evaluation and demonstration of KT displays. Flight performance data were collected to compare the conventional visual display condition to KT conditions. Performance results as well as pilot opinion comments are discussed along with conclusions and implications for further KT system development. This is an interim report because in-depth analysis of the flight data is still underway. The most promising potential benefits in mission applications of KT displays are for conditions where visual task demands are high; for example, helicopter terrain flight requiring continuous visual attention outside the cockpit, and where use of conventional visual displays is complicated by night vision devices. To determine the relation of the sparse, distributed memory to other architectures, a broad review of the literature was made. The memory is called a pattern memory because they work with large patterns of features (high-dimensional vectors). A pattern is stored in a pattern memory by distributing it over a large number of storage elements and by superimposing it over other stored patterns. A pattern is retrieved by mathematical or statistical reconstruction from the distributed elements. Three pattern memories are discussed. B.G.

MULTIPLE TASK ORIENTED PROCESSOR Patent
Douglas G. Webber and George C. Schenck, inventors (to Air Force) Issued 27 May 1986 13 p Supersedes AD-D010554
(AD-D012392; US-Patent-4,591,976; US-Patent-Appl-SN-505165; US-Patent-Class-364-200) Avail: US Patent and Trademark Office CSCL 17/7

The computer system for missile guidance comprises five parallel processors interconnected by a global bus; with each processor having its own CPU, program memory, temporary memory, and two critical variable memories, interconnected by a local bus. The program memory and critical variable memory are hard MNOS to survive nuclear radiation. Each processor has its own cycle time, synchronized by a master clock. In each processor, the cycle has three phases for intercommunication, task processing, and critical variable storage. Thus the critical variables are stored only after task processing is completed. AN ENCODING SCHEME FOR PRESENTATION GRAPHICS WITH ANIMATION
Howard J. Ferch *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 p 11-14 (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

Bit-mapped raster graphics systems are used in the majority of personal computer systems. As the resolution of these systems increases, and the number of levels of gray-scale, or the number of colors, is increased, the encoding of images becomes of greater concern, particularly for interactive systems, or those using animation. A variation of run-length encoding which is faster, but is similar in its degree of space encoding, to run-length encoding is presented. Its application to a menu-driven presentation graphics system is discussed. One particular advantage of this scheme is its adapatability to the types of animation possible on personal computer raster systems. Author

At present, most industrial robots are programmed in a teach mode. In the meantime robots are called upon to perform increasingly complex tasks, which make programming by teaching rather tedious and cumbersome. There is an increasing need for effective tools to assist in off-line programming of robots and verifying their programmed moves. A program for modeling and simulting the PUMA 560 and ADEPT 1 robots was developed. The kinematic models required for the transformation from task space to robot configuration space, and vice-verse, are briefly outlined. The robot geometric models and their graphical manipulation were implemented using MOVIE-BYU amd PLOT-19 on a Tektronix 4115-B graphics terminal and a VAX 11/730 minicomputer. The developed kinematic and geometric models are used for off-line simulation, animation, and verification of robot movements during assembly operations. Sample outputs which illustrate the program capabilities such as shaded images, wire-frame animation, arbitrary point tracing, actual movement envelope, and the various menus are included. Author

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

The Prolog language is a useful tool for geometric and graphics implementations because its primitives, such as unification, match the requirements of many geometric algorithms. Several problems were implemented in Prolog including a subset of Graphics Kernal Standard, convex hull findings, planar graph universal, recognizing groupings of objects, and boolean combinations of polygons using multiple precision rational numbers. Certain paradigms, or standard forms, of geometric programming in Prolog are becoming evident. These include applying a function to every element of a set, executing a procedure so long as a certain geometric pattern exists, and using unification to propagate a transitive function. Certain strengths and weaknesses of Prolog for these applications are now apparent. Author

PORTRAY: AN IMAGE SYNTHESIS SYSTEM
Darwyn R. Peachey *In* Canadian Information Processing Society Graphics Interfacd 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

PORTRAY is an image synthesis system which uses ray tracing to produce realistic images of three-dimensional scenes. Scenes are described to PORTRAY in a high-level description language. The basic geometric modeling technique is constructive solid geometry using primitive solids bounded by planes and quadrics. A variety of optical characteristics and phenomena may be specified. The scene description language allows the user to define objects classes which may be used as if they were built-in primitives. PORTRAY uses a number of techniques, including a technique exploiting bounding volume coherence, to imorove its ray tracing performance. PORTRAY is supported by an array of image manipulation tools which share a common image storage format. Author

AN ADAPTIVE SUBDIVISION BY SLIDING BOUNDARY SURFACES FOR FAST RAY TRACING
Keiji Nemoto and Takao Omachi *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

An adaptive subdivision algorithm for fast ray tracing implemented on parallel architecture using a three dimensional computer array is presented. The object space is divided into several subregions and boundary surfaces for the subregions are adaptively slid to redistribute loads of the computers uniformly. Since the shape of the subregions is preserved as orthogonal parallelepiped the redistribution overhead can be kept small. The algorithm is quite simple but can avoid load concentration to a particular

computer. Simulation results raveal that the adaptive space subdivision algorithm by sliding boundary surfaces reduces the computing time to 3/4 to 1/5 as much as that for the conventional space subdivision algorithm with no redistribution, which reduces the computing time almost proportionally to the number of computers. PROFILING GRAPHIC DISPLAY SYSTEMS
Peter Schoeler and Alain Fournier (Toronto Univ. (Ontario).) *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 7 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

Graphics systems using three dimensional models, and computing a color shaded image for a raster display are very common, and range widely in performance and cost. The first results are presented of a series of profiling of different rendering systems displaying the same scenes on the same machine. The systems studies are a ray-caster, a system using a depth-buffer for visibility determination, and a system using a scan-line Watkins algorithm. The first and last systems have an antializing option. Two types of scenes were used, one made of a constant number of polygons varying in size, and the other made of parametric surfaces varying in level of subdivision. The results, mainly useful for relative comparisons, confirm some predicted behaviors. Author

USING CACHING AND BREADTH-FIRST SEARCH TO SPEED UP RAY-TRACING Abstract Only
Pat Hanrahan *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

Ray-tracing is an expensive image synthesis technique because many more ray-surface intersection calculations are done than are necessary to shade the visible areas of the image. The concept of beam-tracing is extended so that it can be coupled with caching to reduce the number of intersection tests. Two major improvements are made over existing techniques. First, the cache is organized so the cache misses are only generated when another surface is intersected, and second, the search takes place in breath-first order so that coherent regions are completely computed before moving onto the next region. WHAT ARE VISUAL PROGRAMMING, PROGRAMMING BY EXAMPLE AND PROGRAM VISUALIZATION?
Brad A. Myers *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 5 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

There is a great interest recently in systems that use graphics to aid in the programming, debugging, and understanding of computer programs. The terms visual programming and program visualization were applied to these systems. Also, there is a renewed interest in using examples to help alleviate the complexity of programming. This technique is called programming by example. This paper attempts to provide more meaning to these terms by giving precise definitions, and then uses these definitions to classify existing systems into a taxonomy. Author

AN EDITING MODEL FOR GENERATING GRAPHICAL USER INTERFACES
Dan R. Olsen, Jr. *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 5 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

A basic architecture for a User Interface Management System is presented. The problem of updating a display in response to interactive commands is discussed. The basic architecture is then extended to include basic editing and browsing processes on arbitrary data structures. Editing templates are presented as a technique which embodies the entire manipulation process for a particular data structure/data display combination. Such templates in conjunction with the User Interface Management System are able to automatically provide a majority of the code required in an interactive application. Author

AUTOMATIC GENERATION OF GRAPHICAL USER INTERFACES
Gurminder Singh and Mark Green *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

The issues involved in automatically generating the presentation component of user interfaces is examined. The design and implementation of the presentation component of the University of Alberta User Interface Management System are described. The system is used for automatically generating graphical user interfaces for interactive applications. The system was designed to keep the other components of the user interface device independent, keep the designer's interest alive in the design process, make the design process less cumbersome, and reduce the burden of programming as far as possible. The results presented are based on the experience gained through implementing a system to generate the presentation component of user interfaces automatically. The presentation component can be viewed as the lexical level of the user interface. Author

A FAST ALGORITHM FOR GENERAL RASTER ROTATION
Alan W. Paeth *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 5 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

The rotation of a digitized raster by an arbitrary angle is an essential function for many raster manipulation systems. A particularly fast algorithm was derived and implemented which rotates (with scaling invariance) rasters arbitrarily; skewing and translation of the raster is also made possible by the implementatin. This operation is conceptually simple, and is a good candidate for inclusion in digital paint or other interactive systems, where near real-time performance is required. Author

A CEL-BASED MODEL FOR PAINT SYSTEMS
Terry M. Higgins and Kellogg S. Booth *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 9 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

A comprehensive formal model for a computer paint system is presented providing capabilities beyond those of traditional designs. The system incoporates an alpha channel to enable artwork to have variable opacity in a manner reminiscent of cel painting. Operations which may be performed on these RGBA images include digital painting, airbrushing, erasing, masking, and image compositing. These are implemented as instances of the digital composition algebra introduced by Duff and Porter. The implementation model extends a proposal by Tanner. It is cost-effective and is based on the concept of a virtual frame buffer containing a higher-level description of the image being painted and an associated output transformation that maps the

contents into a standard RGB frame buffer used only for viewing. Ways of implementing the model to take advantage of multiprocessing capabilities in various host and frame buffer architectures are discussed and three implementations are examined. Author

DESIGN AND EXPERIENCE WITH A GENERALIZED RASTER TOOLKIT
Alan W. Paeth and Kellogg S. Booth *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 7 p (For primary document see N87-12175 03-61)
Avail: NTIS HC A18/MF A01; also available from the Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

Raster manipulation software is often viewed as an ad hoc means to fine-tune the appearance of digital images, or as a means to reformat them to conform to specific hardware requirements. A universally accepted, machine readable, device-independent specification of a raster image is seldom employed. This stands in contrast to the variety of standards for higher-level scene representation. A general raster type was defined, which unifies the design of a toolkit of raster-based software. Operations performed by the tools are closed in the sense that operators map objects having the raster type onto new objects having the raster type. This closure encourages a synthesis of function by allowing composition of operators. Sequences of these operators are surprisingly powerful and have wide application. Author

GRAPHICS TOOLS IN ADAGIO, A ROBOTICS MULTITASKING MULTIPROCESSOR WORKSTATION
Stephen A. MacKay and Peter P. Tanner *In* Canadian Information Processing Society Graphics Interfacd 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

The developement of Adagio, a robotics simulation workstation, has involved the implementation of several techniques unique to the system. Based on the message-passing, multitasking multiprocessor real time operating system Harmony, Adagio is programmed using a large number of cooperating tasks. Several techniques are based on the concept of a server, a task that is alone repsonsible for governing a scarce resource. The Graphics Server task, the Data Structure Server task, and the Tracker Server task are responsible for the management of the frame buffer, the 3D geometric data structure, and the screen tracker, respectively. Each of these servers is then a separate tool necessary for the implementation of the whole system. Each runs in parallel with other tasks and can handle requests for service from any task. Author

EXPLOITING CLASSES IN MODELING AND DISPLAY SOFTWARE
Turner Whitted and Eric Grant *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 4 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

The class concept is one component of object-oriented programming systems which has proven useful in organizing complex software. In experimenting with the use of classes for geometric modeling application, a class hierarchy was derived that yields some conceptual order in the midst of diverse representations of shapes. Rather than searching for a uniform primitive representation, the diversity was accepted and a framework built in which dissimilar models are combined in an orderly manner. Author

APPLICATIONS OF WORLD PROJECTIONS
Ned Greene *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 7 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

Various techniques were developed which employ projections of the world as seen from a particular viewpoint. A uniform framework for representing and utilizing world projection is proposed and argues that the best general purpose representation is the projection onto a cube. Surface shading and texture filtering issues related to environment mapping are discussed including approximate methods for obtaining diffuse and specular shading values from prefiltered environment maps. It is noted that obtaining accurate diffuse reflection and antialiasing specular reflection, which are both problematical with ray tracing, can be effectively handled by environment mapping. Author

ANIMATING HUMAN FIGURES: PERSPECTIVES AND DIRECTIONS
Norman I. Badler *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

The overall goal of the work is understanding human motion. In particular, motion performance, observation, description, and notation impacts the form of a motion representation. A representation can be verified by a computer graphics performance, and thus the effective control of natural-appearing human figure movement is a significant and challenging goal. Characteristics of a computationally realizable human movement representation are discussed, including distinctions between hierarchic levels, kinematics, and dynamics. The qualitative factors of Effort-Shape notation are used to suggest extensions to existing movement representations in directions consistent with known characteristics of human movement and conventional animation. It is shown how useful and expressive motion qualities may be at least approximated by a combination of kinematic and dynamics computations, with kinetic control modulated by acceleration and decelerations derived from exisitng interpolation methods. Interactions between motions by phrasing, temporal properties, or relationships may be described and executed within an appropriately detailed model. Author

THE INTERACTIVE SPECIFICATION OF HUMAN ANIMATION
G. Ridsdale, S. Hewitt, and T. W. Calvert *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 10 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

The Figure Animation Project in progress at Simon Fraser University is described. The project has two goals for the specification of figure animation: the first is to implement an interactive Figure Animation Test Bed for specifying movement at the detail level and the second is to develop a mechanism for describing figure animation at the scene level. These goals and the approaches to solving them are discussed. In particular, the application of knowledge-based inference to the problem of scene description is examined. Author

GOAL DIRECTED ANIMATION USING ENGLISH MOTION COMMANDS
Karin Drewery and John Tsotsos *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 5 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

A prototype 3D animation system which can execute limited types of English motion commands by solving simple goals and directions is presented. This system had a frame-based knowledge base (KB) to describe objects and another to describe motion. A hierarchical planning system uses the motion descriptions as forward production rules to form a plan for a goal task. Directional commands relative to the object or a reference object can also be processed by refering to the directional description in the motion KB and the object's reference frame. The underlying objective is to develop a method to incorporate goals into a graphical animation system so that it will be a task level system, where a behavior is described in terms of events and relationships and frees the user from specifying all details of a motion. VIRYA: A MOTION CONTROL EDITOR FOR KINEMATIC AND DYNAMIC ANIMATION

Jane Wilhelms *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

Virya is an interactive graphical motion control editor for kinematic and dynamic animation. Most animation is controlled kinematically, by designating objects' positions taken over time without consideration for the causes of the motion. An alternative is dynamic motion control, where objects are seen as masses moving under the influence of forces and torques. Dynamic motion control has some advantages in that motion more naturally simulates real world conditions and many complex motions can be automatically calculated, though calculating motion is quite expensive and control is sometimes less intuitive. The editor Virya works both for kinematic and dynamic motion control. It has two main tasks: to specify control functions representing positions (kinematic) or forces and torques (dynamic) controlling motin, and to specify control modes which designate how control functions are interpreted or whether joints are frozen in place, relaxed, or balanced. Using these control modes, the user can designate motion using a convenient kinematic method and still use dynamic analysis as a final step to constrain and add realism. Author

NEAR-REAL-TIME CONTROL OF HUMAN FIGURE MODELS

W. W. Armstrong, M. Green, and R. Lake *In* Canadian Information Processing Society Graphics Interfacd 1986: Proceedings 1986 5 p (For primary document see N87-12175 03-61)

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

The animation of human figures is one of the major problems in computer animation. A recent approach to this problem is the use of dynamic analysis to compute the movement of a human figure given the forces and torques operating on the body. One of the main problems with this technique is computing the forces and torques required for particular motions. As a solution to this problem an interactive interface to the dynamics routines was produced. This interface, along with a collection of low level motion processes, can be used to control the motion of a human figure model. Both the user interface to the dynamic routines and the motion processes used are described. Author

CONSTRAINT-BASED MODELING OF THREE-DIMENSIONAL SHAPES

Przemyslaw Prusinkiewicz and Dale Streibel *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

Constraint-based modeling, so far perceived primarily as a graphics technique for man-machine interaction, provides a viable method for the modeling of complex surfaces. The idea of constraint-based modeling of three-dimensional shapes is described and illustrated by examples. Difficulties related to the practical application of this idea are discussed, and methods for overcoming them are outlined. A potential of the constraint-based approach to the modeling of shapes found in nature is indicated. Author

THE STOCHASTIC MODELLING OF TREES

Alain Fournier and David A. Grindal *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 9 p (For primary document see N87-12175 03-61)

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

A fast method is presented for the modeling of trees which brings together two interesting techniques. The trees are modeled as convex polyhedra for the description of the gross shape, and three-dimensional texture mapping is used for the detailed features. The essential volume of the tree is represented as the convex intersection of half spaces. The advantages of this representation is that it allows an adaptive level of detail in the display. A special algorithm was used for the display of the convex intersection which computes it directly in the frame buffer. The algorithm also allows the computation of intersecting polyhedra. To transform the convex polyhedra into a more realistic representation of trees, a three-dimensional texture mapping was used to modulate the shape and the color of the basic polyhedra. An irregular nonconvex object was then obtained which is consistent in shape and general appearance regardless of the point of view and the size on the screen. Three dimensional fractional Brownian motion is one of the procedural texture used. Author

METHODS FOR STOCHASTIC SPECTRAL SYNTHESIS

J. P. Lewis *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 7 p (For primary document see N87-12175 03-61)

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

A number of spectral modeling approaches in the engineering and estimation literature are potentailly applicable to stochastic synthesis in computer graphics. Two specific approaches are developed. The orthogonality principle of estimation theory is used to derive a stochastic subdivision construction with specified autocorrelation and spectrum properties; this approach also provides an alternative theoretical basis for the popular fractal subdivision algorithms. A shaped Poisson point process is a second approach which conveniently separates the spectral and graphic modeling problems. Synthetic textures and terrains are presented as a means of visually evalutaing the constructed noises. Author

INTERACTIVE 3-D MODELING WITH PERSONAL COMPUTERS

Robert W. Thornton and Gregory J. Glass *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986

6 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

An interactive three-dimensional modeling system, called Facet, is presented. Facet was developed for use during the design of physical artifacts; from studies of simple shapes, spaces, and forms to detailed modeling of complex physical systems. Facet provides a visual medium for enhancing perception of the model and for exploring various alternatives during the design process. In order to make this 3-D modeling medium available and affordable to any interested design professional Facet operates on commonly available IBM or compatible personal computers. In addition to an overall description of Facet and its interactive modeling techniques, several underlying issues in the development of a modeling system are discussed. These issues include: the interactive user interface; 3-D display techniques; and ways of dealing effectively with model complexity. A number of areas for continued development, based on experience with the current implementation, are discussed.

LEARNING GRAPHICS PROGRAMMING BY DIRECT COMMUNICATION
Martin Tuori and Tim Pointing *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 5 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

The process of learning the graphics functions of a computer graphics workstation environment is both assisted and hampered by the presence of an intermediary programming language. Assistance comes in the form of programming language functions for preprocessing, storage declaration, expression evaluation, control flow, and system libraries. Working against the student, compilation of programmed examples is slow, and errors may arise both from the syntax and semantics of the graphics functions, and from those of the programming language. An approach is proposed to learning the graphics functions that temporarily separates the graphics component from other aspects of the overall programming environment; in a sense, training wheels are proposed for the graphics subsystem. The approach was used in creating, for the IRIS series of workstations, a graphics interpreter that allows a student to test out graphics concepts, without the need to write programs. Subroutine calls typed to the interpreter were performed immediately, allowing a quick, trial-and-error approach. It is argued that this approach is a useful addition to conventional learning techniques, and that its success can be attributed to bringing the student programmer into more direct communication with the graphical components of the programming environment.

HARDWARE ASSISTANCE FOR Z-BUFFER VISIBLE SURFACE ALGORITHMS
Kellogg S. Booth, David R. Forsey, and Alan W. Paeth *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 8 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

The well-known z-buffer algorithm for solving the visible surface problem has a number of points in its favor, the main one being that it is amenable to very efficient hardware implementation at little additional cost in many existing frame buffer systems. The traditional software implementation of the algorithm assumes explicit initialization of both the image buffer and the z-buffer before each image is generated. A single technique is described for synchronizing initialization and image generation so the two can be performed in parallel, allowing complete overlap to be achieved and effectively eliminating the time needed for explicit initialization of the frame buffer. The technique assumes a modest investment in additional hardware within the frame buffer.

Throughout the computer graphics literature, but in modeling and animation lore in particular, the prevalent attitude seems to be that scripting and interaction are irreconcilably different types of user interface. The belief that this dichotomy is a myth is propounded and examples of system which encourage this belief are given. Two of the systems described are a keyframe animation program and a geometric modeling program developed at the NYIT Computer Graphics Laboratory. Both of these systems are used on a daily basis for production, development, and research.

SURVEY OF TEXTURE MAPPING
Paul S. Heckbert *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

Texture mapping is one of the most successful techniques in high quality image synthesis. Its use can enhance the visual richness of raster scan images immensely while entailing only a relatively small increase in computation. The technique was applied to a number of surface attributes: surface color, surface normal, specularity, transparency, illumination, and surface displacement, to name a few. Although the list is potentially endless, the techniques of texture mapping are essentially the same in all cases. The fundamentals of texture mapping which can be split into two topics, will be surveyed: the geometric mapping which warps a texture onto a surface, and the filtering which is necessary in order to avoid aliasing. An extensive bibliography is included.

KEYFRAME-BASED SUBACTORS
L. Forest, D. Rambaud, N. Magnenat-Thalmann, and D. Thalmann *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 4 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

The concept of keyframe-based subactor attempts to span two major types of animation: parametric keyframe animation and algorithmic animation. In a keyframe-based subactor, all parameter values are defined by interpolation, however, if there is a law defined for one parameter, this law is applied and values computed by interpolation are ignored. The application of keyframe-based subactors to human motion is also discussed.

INTERFACING IMAGE PROCESSING AND COMPUTER GRAPHICS SYSTEMS USING AN ARTIFICIAL VISUAL SYSTEM

James M. Coggins, Kevin E. Fogarty, and Fredric S. Fay *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p Prepared in cooperation with Worcester Polytechnic Inst., Mass. (For primary document see N87-12175 03-61)

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

An Artificial Visual System (AVS) was developed to simplify three-dimensional microscope images for presentation and manipulation in an interactive computer graphics system. The AVS consists of several sets of spatial filters that decompose an image along three different measurement continua. A recombinatin algorithm processes the filter outputs to detect objects, to eliminate noise, and to map the detected objects into points in a multidimensional feature space. Recent discoveries regarding the geometry of the points in the feature space are described. One recent result simplifies the AVS by decreasing the number of filters required to obtain the same measurements. Not only are accurate measurements possible, but certain image distortions can be modeled and counteracted in the feature space. Author

ASTERISK: AN EXTENSIBLE TESTBED FOR SPLINE DEVELOPMENT

Jonathan R. Gross, Tony D. DeRose, and Brian A. Barsky *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)

(Contract N00039-82-C—0235; Grant NSF ECS-82-04381)

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

Asterisk is a testbed system designed to support the development of new kinds of splines. The key concept is the integration of symbolic computation facilities with tools for interactively modifying and comparing different splines. By modeling a spline as a list of attributes, Asterisk can be used to create and manipulate almost any spline, without making assumptions about the future directions of spline research. Author

GRAPHICAL APPLICATIONS OF L-SYSTEMS

Przemyslaw Prusinkiewicz *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

A method for generating pictures is presented and illustrated with examples. The idea is to generate a string of symbols using an L-system, and to interpret this string as a sequence of commands which control a turtle. Suitable generalizations of the notions of the L-system and of a turtle are introduced. The resulting mathematical model can be used to create a variety of (finite appoximations of) fractal curves, ranging from Koch curves, to classic space-filling curves, to relatively realistic-looking pictures of plants and trees. All these pictures are defined in a uniform and compact way. Author

FRACTALS, COMPUTERS AND DNA

Peter Oppenheimer *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

A fractal computer model of branching objects is presented. This program generates pictures of simple orderly plants, complex gnarled trees, leaves, vein systems, as well as inorganic structures such as river deltas, and snowflakes. More than just a visual simulation, this program models the growth process by mimicking the logic of an organism's genetics. By manipulating the genetic parameters, one can modify the geometry of the object in real time, using tree based graphics hardware. The random effects of the enviromnent are taken into account, to produce greater diversity and realism. The program provides a study in the structure of branching objects that is both scientific and artistic. The results suggest that organism and computers deal with complexity in similar ways, and that the fractal nature of an organism has evolved as a critical means for the survival of the species. A KNOWLEDGE-BASED APPROACH TO COMPUTER VISION SYSTEMS

Martin D. Levine and Wade Hong *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

In designing and constructing computer vision systems, many crucial issues need to be addressed. Foremost of these are the control and organization of the visual information processing tasks involved, and the representation and usage of both knowledge and data. As computer vision systems have evolved, growing in complexity and size, these issues have become increasingly important to their overall success. A recent and increasingly popular approach to image understanding, the knowledge-based system, is presented as a framework in which to deal with these issues. The engineering of a computer vision system as a knowledge-based system and these issues, in the context of the evolving system is discussed. Author

INTEGRATION OF REMOTELY SENSED DATA AND GEOGRAPHIC INFORMATION SYSTEMS Abstract Only

David G. Goodenough *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 1 p (For primary document see N87-12175 03-61)

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

Canada is heavily dependent upon the effective utilization of its resources. To better manage the resources, resource managers are increasingly turning to computer-based technologies. Two particularly important technologies for resource information management systems are remote sensing and geographic information systems (GIS). Operational resource managers are using the geographic information systems to store digital representations of their resource maps. Associated with these graphical digital maps are databases containing the attributes of map features. The efforts in integrating remote sensing data and GIS are reviewed and the approach at the Canada Centre for Remote Sensing is presented.

A brief discussion of the problem of exchanging data among geographic information systems will also be addressed. Author

IMAGE SEGMENTATION BASED ON COLOR AND TEXTURE GRADIENT
Phu Thien Nguyen *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

An image segmentation scheme based on a model of human perception of color and texture is proposed. It consists of the following steps: spatial segmentation of each Red-Green-Blue (RGB) image using an edge detector, contour following and closing algorithms; characterization of each intersection by color (statistical parameters of the RGB values of pixels within the intersection), shape (perimeter, area, compactness), orientation, and topology (neighbor, inclusion); merging of the elementary segments based on the selection of their attributes; and segmentation by texture gradient based on the window correlation technique to identify coherent texture regions. A Knowledge Based System (KBS) for analyzing LANDSAT Multispectral Band Scanner (MSS) images and comparing this analysis to corresponding geocartogrphic data is presented. The preprocessing requirements for the LANDSAT and the geocartographic data are discussed for a uniform representation of the data. The segmentation of the LANDSAT data and the interpretation of the segments are presented. The preprocessed data are read into the Map/Image Congruency Evaluation (MICE) KBS where the image elements are classified and then compared with the map data, based on class, segment size, shape, and location. Results of the map/image congruency analysis are output and converted to image form. The MICE KBS is presented and the results generated for the LANDSAT MSS scene of the Prince George area of British Columbia are reviewed. Author

PRINCIPLE OF VISUAL COLOR CODING APPLIED TO SATELLITE IMAGERY [PRINCIPE DE CODAGE VISUEL DE LA COULEUR APPLIQUE A DES IMAGES SATELLITAIRES]
M.-J. Lefevre-Fonollosa and H. Cruchant *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 3 p In FRENCH; ENGLISH summary (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

In remote sensing, color is used essentially as a means of enhancing the results of image processing. In recent months, the use of color as a means of processing the spatial information content of image data was investigated. The characteristics of the human visual system were used in an approach to the processing of remote sensing imagery. Specifically, three channels of a spatial radiometer was used to simulate the sensor function of the human eye while the computer processing was used to simulate the function performed by the second segment of the system. When an image is subjected to this type of simulation-processing, the result is three new-images termed the color-coded image, the lighting-coded image, and the color-quantity-coded image. Comments on this approach and its prospects with suitable reference to examples based on the Thematic Mapper and (simulated) SPOT data are included. Author

A FILE ORGANIZATION SCHEME FOR POLYGON DATA
Chung Hee Hwang and Wayne A. Davis *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

A file organization scheme for representing polygon data by a quadtree is presented. The proposed scheme is an adaptive cell method that is based on extendible hashing and interpolation-based index maintenance. It aims, on the average, to locate the record associated with a given key with one disk access (or at most two), maintaining a high storage utilization ratio. It also aims to process range search and set operations efficiently. The dynamic file organization capabilities of the scheme and the algorithm for range search are described. Author

MATHEMATICAL MORPHOLOGY APPLIED TO RANGE IMAGE PROCESSING
Colin C. Archibald and Stanley R. Sternberg (Machine Vision International Ltd., Ann Arbor, Mich.) *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 7 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

Methods of low level image processing were predominately derived by generalizing one dimensional signal processing methods to 2 dimensions. Although much progress was made using Fourier domain analysis, it is still unintuitive and inflexible for many types of applications. Mathematical morphology is reviewed as a basis for low level image processing, and demonstrates that image domain transformations can be applied usefully to various types of images. Specifically, range images are processed using grey scale morphology to extract various features used in three dimensional analysis of a scene. This type of scene analysis has broad potential for applications in quality control and automated manufacturing. Author

INCREMENTAL CONSTRUCTION OF 3-D MODELS FROM A SEQUENCE OF FRAMED VIEWS: MATCHING PARTIAL OBJECTS
Shun-en Xie and Thomas W. Calvert *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 7 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

In the future intelligent mobile robots will be called upon to play many important roles. In many realistic situations, the knowledge of the structure and placement of objects in an environment should be learned rather than built in. Thus the mobile robot must often construct 3-dimensional models for the objects

by analyzing sensed multiple views. An approach which describes the incremental construction of 3-D body model in a practical office or warehouse environment by matching planned multiple views is presented. This approach combines such intelligent robot functions as attention, planning, sensing, learning, and knowledge rectification. A prototype system for matching and constructing 3-D body models was implemented and tested with synthesized images using C-PROLOG under Berkeley UNIX on a VAX 11/750.

IMAGE TECHNIQUES FOR THE IDENTIFICATION OF DEPRESSIONS AND OTHER OBSTACLES IN AUTOMATED GUIDANCE OF ROVING ROBOTS

Malek Adjouadi *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 5 p (For primary document see N87-12175 03-61)

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

The problem of detection of depressions or drop-offs in the automated guidance of roving robots is analyzed. The proposed approach is based on the principle that if one is too near a depression, one is bound to see new information which initially was occluded. To exploit this principle, two steps are undertaken. The first step involves the derivation of the correspondence process to allow the vision system to relate a location of interest in a sequence of frames. The second step involves the development of methods to detect and identify, in this location of interest, the occluded information.

A COMPUTATIONAL THEORY OF 3D SHAPE RECONSTRUCTION FROM IMAGE CONTOURS

Ping Liang and John S. Todhunter *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 5 p (For primary document see N87-12175 03-61)

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

The computational theory of 3-D shape reconstruction from image contours proposed is based on the variational principles and has the theoretical framework suggested recently by Poggio. By this theory, 3-D shapes can be reconstructed from image contours by general physical constraint assumptions, namely the assumptions of minimum potential energy, isotropism, and homogeneity of the material, and properly defined energy functionals. It is assumed that contours were classified as surface discontinuity boundary contours, surface contours, and extremal boundaries. Minimization of the energy functionals tends to maximize the symmetry and orthogonalize the surface junctions of the reconstructed object. Some early findings are obtained as the natural results of the theory. Theoretical developments and experimental results are successful and promising.

SELECTION AND USE OF IMAGE FEATURES FOR SEGMENTATION OF BOUNDARY IMAGES

Deborah Walters *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

An algorithm is developed to segment arbitrary boundary images into sets of boundaries which represent a single object, and to group together lines which correspond to a single object or object part. The algorithm is based on features which were found to be used by humans in the early stages of visual processing, and which have a high correlation with preceptually significant aspects of images. In addition, the data structure used is based on the image representation used in the primate visual cortex. By using perceptually valid features, the algorithm is able to enhance the perceptually significant edges in an image using simple, local, parallel computations. It demonstrates that selective processing, without domain specific knowledge, iterative processing, or top-down control of some mechanism shifts attention.

SPEEDED PHASE DISCRIMINATION: EVIDENCE FOR GLOBAL TO LOCAL PROCESSING

J. M. Barr *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

In recent years much attention was given to the advantages of multiple resolution preprocessing methods in computer vision. There is strong evidence that the parallel extraction of luminance changes over different spatial scales also occurs in human visual perception. The first experiment confirms the strong evidence that reponses to low resolution signals can be elicited as much as 100 msec faster than to high spatial frequency stimuli of the same contrast. A further experiment measured the reaction time to discriminate the relative phase of the higher frequency component of a luminance grating comprising a fundamental and its second harmonic. It was found that the decision can be made more rapidly when the fundamental is low than high. On the assumption that the gross structure of spatial forms is conveyed by low spatial frequencies, this supports the idea that the substrate for the subjective impression that rough describers of visual forms precede detailed preception. It is the progressive increase in response time with frequency, of the visual mechanisms implementing spatial filtering.

CORRESPONDENCE IN APPARENT MOTION: DEFINING THE HEURISTICS

Marc Green *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)

Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

Correspondence matching in apparent motion is based on two heuristics: match images if they have a similar form and are in close proximity. Psychophysical experiments are used to define these heuristics. Observers judged motion path between images in a competition paradigm. Results showed that the tokens used in form matching are spatial frequency and orientation. Further, proximity is defined in a 3-D spatial reconstruction rather than 2-D retinal coordinates. A possible representation for the computation of correspondence is a multidimensional detector space, with dimensions including spatial frequency, orientation, X, Y, Z (or disparity) coordinates.

DETERMINING DISPLACEMENT FIELDS ALONG CONTOURS FROM IMAGE SEQUENCES
Patrick Bouthemy *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

A framework was proposed for image flow analysis consisting of three major stages: determination of moving edges by some local process; integration of motion information along linked contours; and propagation of motion estimation through homogeneous regions obtained inside these contours. The first two stages will be examined. A procedure, based on some local modeling and maximum likelihood scheme, was designed to perform the first step. After some linking process, constraints provided by the measurements gained from the first stage can be combined to compute the velocity field along contours, by minimizing some simple functional. To this end, a gradient algorithm is used with a recursive estimation from one point to its successor in the chain. Author

A METHOD OF LEARNING RULES FROM UNCERTAIN DATA APPLIED TO THE COMPUTER VISION PROBLEM
D. Hutber and P. Sims *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 5 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

The construction of knowledge-based systems of a size large enough to be useful has led to problems of knowledge acquisition. A way of solving this is to enable the computer to automatically generate its own knowledge form sets of sample data. This becomes further complicated when the sample data may have errors or noise in it. A system is described that generates knowledge in the form of rules from uncertain data, in the domain of computer vision. The way in which the uncertainty arises and is processed is discussed, and some sample results are presented. Author

SEQUENTIAL ESTIMATION OF BOUNDARIES IN TEXTURE IMAGES
Dragana Brzakovic and Antonios Liakopoulos (System Dynamics, Inc., Gainesville, Fla.) *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 4 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

A method is described for estimating boundaries between perceptually distinct regions in an image. The method is a two step procedure which first identifies image regions which exhibit uniformity. Boundaries between uniform regions are approximated by a complete cubic spline function and the linear recursive filter is used to estimate the values of the function at the knots. Boundaries are assumed to be smooth; however, abrupt changes in boundary location may infrequently occur. In these exceptional cases flexibility of boundary approximation is achieved by adding additional knots at the positions where abrupt changes occur. Author

DETECTION OF SPECULARITIES IN COLOUR IMAGES USING LOCAL OPERATORS
Paul N. E. Pellicano *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 5 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 6th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

Areas of spectral reflectance, or highlights, can be analyzed for a wide range of information or clues that they give about a scene. A local algorithm for analyzing a moderately unconstrained color image to determine the areas of spectral reflectance is presented. The location of specular reflectances are marked by finding zero-crossings in concave down regions for two-dimensional arrays of intensities representing the color image. These zero-crossings correspond to the centers of the highlight regions. The highlight centers are then expanded to highlight regions by region growing in a direction orthogonal to the local orientation of the hightlight. Thus, at the conclusion of the algorithm, the information known about each highlight includes location, size, and direction. Author

DETECTING GLASS FIBERS USING COMPUTER VISION
Alfred S. Malowany, Martin D. Levine, Mussa R. Kamal, Ronald Kurz, and Abdol-Reza Mansouri *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 5 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

An application of computer vision in the field of chemical

engineering, the processing of images of glass fibers is presented. Fibers are used as reinforcement for several polymer products to enhance their mechanical and thermal performance. In order to evaluate the properties of the polymer products, however, a quantitative measure of fiber length and orientation is required. The algorithm presented here locates the fibers present in a given image and thus enables their quantification in length and orientation. This algorithm operates in two steps. In the first step, feature points in the image are extracted in order to enable the generation of hypotheses as to the possible presence of fibers. In the second, the generated hypotheses are verified and the hypotheses that yield the highest confidence are retained. Author

OPTICAL CHARACTER RECOGNITION OF TOUCHING CHARACTERS
S. Shlien and K. Kubota *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 6 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

A method for isolating and recognizing characters in typeset text containing, touching, or overlapping characters is described. The method relies on vector quantization techniques to represent the text by an ordered sequence of codes. Characters or character fragments are extracted form this code using a form of string matching and network searches. Compatibility relationships are applied to these fragments to obtain a list of possible input strings. Simulations on the Symbolics 3640 workstation do not indicate that this method would replace conventional template matching schemes. Author

CONTOUR LINE REGION SEGMENTATION Abstract Only
Lawrence OGorman and Gerald I. Weil *In* Canadian Information Processing Society Graphics Interface 1986: Proceedings 1986 5 p (For primary document see N87-12175 03-61)
Avail: Canadian Information Processing Society, 243 College Street, 5th Floor, Toronto, Ontario $30.00 Canada, $35.00 USA

In images such as of contour maps, fingerprints, and electric fields, regions of contour lines can be distinguished, and these regions are often used for image understanding. In this work, such images are collectively termed contour line images. The objectives are to determine the properties by which contour line regions are characterized, and to develop an approach using these properties to automatically determine regions. An algorithm is proposed to group lines into regions. This is based in part on the parallel-adjacency criterion which is defined here. The algorithm was applied to several contour line images, and the resultant regions are shown. Author

Multiversion or N-version programming was proposed as a method of providing fault tolerance in software. The approach requires the separate, independent preparation of multiple versions of a piece of software for some application. Specific topics addressed are: failure probabilities in N-version systems, consistent comparison in N-version systems, descriptions of the faults found in the Knight and Leveson experiment, analytic models of comparison testing, characteristics of the input regions that trigger faults, fault tolerance through data diversity, and the relationship between failures caused by automatically seeded faults. Avail: NTIS HC A03/MF A01 CSCL 09B

Information was collected on the efficacy of fault-tolerant software by conducting two large-scale controlled experiments. In the first, an empirical study of multi-version software (MVS) was conducted. The second experiment is an empirical evaluation of self testing as a method of error detection (STED). The purpose of the MVS experiment was to obtain empirical measurement of the performance of multi-version systems. Twenty versions of a program were prepared at four different sites under reasonably realistic development conditions from the same specifications. The purpose of the STED experiment was to obtain empirical measurements of the performance of assertions in error detection. Eight versions of a program were modified to include assertions at two different sites under controlled conditions. The overall structure of the testing environment for the MVS experiment and its status are described. Work to date in the STED experiment is also presented. B.G.

THE IMPLEMENTATION AND USE OF ADA ON DISTRIBUTED SYSTEMS WITH HIGH RELIABILITY REQUIREMENTS Semiannual Progress Report
J. C. Knight, S. T. Gregory, and J. I. A. Urquhart Aug. 1985 36 p
(Grant NAG1-260)
(NASA-CR-179806; NAS 1.26:179806; UVA/528213/CS86/107)
Avail: NTIS HC A03/MF A01 CSCL 09B

The use and implementation of Ada in distributed environments in which reliability is the primary concern were investigated. In particular, the concept that a distributed system may be programmed entirely in Ada so that the individual tasks of the system are unconcerned with which processors they are executing on, and that failures may occur in the software or underlying hardware was examined. Progress is discussed for the following areas: continued development and testing of the fault-tolerant Ada testbed; development of suggested changes to Ada so that it might more easily cope with the failure of interest; and design of new approaches to fault-tolerant software in real-time systems, and integration of these ideas into Ada. B.G.

SMP: A SOLID MODELING PROGRAM VERSION 2.0
Donald P. Randall, Kennie H. Jones, William H. vonOfenheim, Raymond L. Gates, and Christine G. Matthews Sep. 1986 218 p
(Contract NAS1-17999)
(NASA-CR-178183; NAS 1.26:178183) Avail: NTIS HC A10/MF A01 CSCL 09B

The Solid Modeling Program (SMP) provides the capability to model complex solid objects through the composition of primitive geometric entities. In addition to the construction of solid models, SMP has extensive facilities for model editing, display, and analysis.

The geometric model produced by the software system can be output in a format compatible with existing analysis programs such as PATRAN-G. The present version of the SMP software supports six primitives: boxes, cones, spheres, paraboloids, tori, and trusses. The details for creating each of the major primitive types is presented. The analysis capabilities of SMP, including interfaces to existing analysis programs, are discussed. B.G.

COMPUTER SIMULATION OF ON-ORBIT MANNED MANEUVERING UNIT OPERATIONS
Gary M. Stuart and Kathy D. Garcia 1986 7 p
(Contract NAS9-17354)
(NASA-CR-179904; NAS 1.26:179904) Avail: NTIS HC A02/MF A01 CSCL 09B

Simulation of spacecraft on-orbit operations is discussed in reference to Martin Marietta's Space Operations Simulation laboratory's use of computer software models to drive a six-degree-of-freedom moving base carriage and two target gimbal systems. In particular, key simulation issues and related computer software models associated with providing real-time, man-in-the-loop simulations of the Manned Maneuvering Unit (MMU) are addressed with special attention given to how effectively these models and motion systems simulate the MMU's actual on-orbit operations. The weightless effects of the space environment require the development of entirely new devices for locomotion. Since the access to space is very limited, it is necessary to design, build, and test these new devices within the physical constraints of earth using simulators. The simulation method that is discussed here is the technique of using computer software models to drive a Moving Base Carriage (MBC) that is capable of providing simultaneous six-degree-of-freedom motions. This method, utilized at Martin Marietta's Space Operations Simulation (SOS) laboratory, provides the ability to simulate the operation of manned spacecraft, provides the pilot with proper three-dimensional visual cues, and allows training of on-orbit operations. The purpose here is to discuss significant MMU simulation issues, the related models that were developed in response to these issues and how effectively these models simulate the MMU's actual on-orbiter operations. PS: A NONPROCEDURAL LANGUAGE WITH DATA TYPES AND MODULES Final Report
Maya B. Gokhale (Delaware Univ., Newark.) Oct. 1986 20 p Presented at the International Conference on Software Engineering
(Contract NAS1-18107; Grant UDRF-LTR860114)
(NASA-CR-178198; ICASE-86-67; NAS 1.26:178198) Avail: NTIS HC A02/MF A01 CSCL 09B

The Problem Specification (PS) nonprocedural language is a very high level language for algorithm specification. PS is suitable for nonprogrammers, who can specify a problem using mathematically-oriented equations; for expert programmers, who can prototype different versions of a software system for evaluation; and for those who wish to use specifications for portions (if not all) of a program. PS has data types and modules similar to Modula-2. The compiler generates C code. PS is first shown by example, and then efficiency issues in scheduling and code generation are discussed. Author

PARALLEL SCHEDULING OF RECURSIVELY DEFINED ARRAYS Final Report
Thomas J. Myers and Maya B. Gokhale (Delaware Univ., Newark.) Oct. 1986 26 p Submitted for publication
(Contract NAS1-18107; Grant UDRF-LTR860114)
(NASA-CR-178195; ICASE-86-66; NAS 1.26:178195) Avail: NTIS HC A03/MF A01 CSCL 09B

A new method of automatic generation of concurrent programs which constructs arrays defined by sets of recursive equations is described. It is assumed that the time of computation of an array element is a linear combination of its indices, and integer programming is used to seek a succession of hyperplanes along which array elements can be computed concurrently. The method can be used to schedule equations involving variable length dependency vectors and mutually recursive arrays. Portions of the work reported here have been implemented in the PS automatic program generation system. Author

INSTRUMENTATION TOOLS FOR PROGRAM TESTING M.S. Thesis [FERRAMENTAS DE INSTRUMENTACAO PARA TESTES DE PROGRAMAS]
Luiz Fernando Capretz Sep. 1986 109 p In PORTUGUESE; ENGLISH summary
(INPE-3983-TDL/235) Avail: NTIS HC A06/MF A01

Reliable program production is important, a premise taken into account in this work. Several methods, techniques and tools for program testing are studied, and problems and limitations found during the testing process are presented. Finally, a tool for program testing is proposed, which assembles additional information about the programs. This tool analyses commands and assertions put into the source code of the program as comments (probes) and constructs another program (instrumented program), in which, at the time of execution performs display, verification and analysis based on the inserted instrumentation. RECOGNITION OF TWO-DIMENSIONAL SHAPES M.S. Thesis
Gim P. Quek Mar. 1986 103 p
(AD-A168403) Avail: NTIS HC A06/MF A01 CSCL 09/4

A new scheme for coding the boundary of two-dimensional shapes is proposed in this thesis. Random points on the boundary are paired for this coding. Using this scheme, an effective and efficient correlation technique to match two-dimensional shapes is developed. This technique has a number of very desirable characteristics. It is able to match shapes of arbitrary scale and orientation. The given shape may have closed or open boundary or even have a portion of it obstructed from view. Matching can be performed at varying degrees of detail, giving this technique an added robustness against geometric distortions. It also has the capability to discriminate between different shapes. Computation time on the IBM 3033 computer is typically 10 CPU seconds to generate one correlation curve between two shapes, each with a 500-point boundary curve. Author (GRA)

A THIN CYLINDER PROBLEM Final Report
G. P. OHara Apr. 1986 21 p
(AD-A168665; ARCCB-MR-86013) Avail: NTIS HC A02/MF A01 CSCL 09/2

A test problem was required for the evaluation of the computer aided design (CAD) system, which is currently being purchased by Benet Weapons Laboratory. We needed a relatively simple finite element stress anlaysis problem which could easily be done on a CAD system, by the potential contractor, to demonstrate a particular system. The geometry selected was a simple thin cylinder of mean radius 1.0 subjected to an axial tension load. The load is distributed at the ends of the cylinder to produced a uniform unit (1.0) nominal stress. The cylinder is 3 PI (9.4278) long and contains a single perforation at mid-length, in the form of a circular hole of radius 0.15. The problem is to find the stress concentration factor (S.C.F.) for the hole when the thickness of the cylinder is

0.0143525. The most desirable solution is for a shell formulation with membrane and vending stiffness terms. Along with the S.C.F., it is also desirable to generate the following graphic output: (1) A deformed structure plot; (2) A maximum principal stress contour plot on the inside surface; and (3) A maximum principal stress contour plot on the outside surface. If necessary, the problem may be reduced to a membrane problem with only one contour plot. GRA

The Air Force Wright Aeronautical Laboratories Materials Laboratory is charged with developing a research program for applications of Artificial Intelligence as it relates to manufacturing. As a part of program development, advisory input was sought from experts from industry, academia, and government. A structured methodology was employed which featured a top-down approach leading from concept level articulation, through application area goals and objectives, to project level detail. This report documents the effort in terms of providing methodological background, application area goals and objectives, and results obtained from project generation and assessment. Author (GRA)

Certain new approaches to linear programming have recently received considerable publicity because of the promise of substantial improvements in efficiency compared to the simplex method. This note briefly discusses several research directions in methods for solving linear programs using nonlinear problem transformations. In particular, we describe application of a barrier transformation to the dual, and the development of sparse least-squares methods based on the LU factorization of the least-squares matrix of its transpose. PRO/MAPPER: A PLOTTING PROGRAM FOR THE DEC PRO/300 PERSONAL COMPUTERS UTILIZING THE MAPPER GRAPHICS LANGUAGE
J. W. Wachter May 1986 55 p
(Contract DE-AC05-84OR-21400)
(DE86-012635; ORNL/TM-9833) Avail: NTIS HC A04/MF A01

PRO/Mapper is an application for the Digital Equipment Corporation PRO/300 series of personal computers that facilitates the preparation of visuals such as graphs, charts, and maps in color or black and white. The user prepares an input data file containing English-language commands and writes it into a file using standard editor. PRO/Mapper then reads these files and draws graphs, maps, boxes, and complex line segments onto the computer screen. Axes, curves, and error bars may be plotted in graphical presentations. The commands of PRO/Mapper are a subset of the commands of the more sophisticated MAPPER program written for mainframe computers. The PRO/Mapper commands were chosen primarily for the production of linear graphs. Command files written for the PRO/300 are upward compatible with the Martin Marietta Energy Systems version of MAPPER and can be used to produce publication-quality slides, drawings, and maps on the various output devices of the Oak Ridge National Laboratory mainframe computers. APPLICATION OF PROGRAM POISSON TO AXIALLY-SYMMETRIC PROBLEMS - MAGNETOSTATIC AND ELECTROSTATIC - WITH USE OF A PROLATE SPHEROIDAL BOUNDARY
S. Caspi, M. Helm, and L. J. Laslett Jan. 1986 69 p
(Contract DE-AC03-76SF-00098)
(DE86-012826; LBL-20893) Avail: NTIS HC A04/MF A01

A version of the relaxation program POISSON has been produced that, for magnetostatic problems, can apply a boundary condition consistent with no external sources being present. This capability includes the treatment of axially-symmetric cases (using A* = rhoA as the working variable) with a boundary whose form is that of a prolate spheroid (and hence tends toward spherical in the limit eta = a/square root of (a squared - b squared) approaches infinity. The treatment of electrostatic problems (to obtain solutions for the scalar potential V) necessarily must differ in detail from the treatment of magnetostatic problems in cases of axial symmetry. It seems desirable, therefore, first to review the magnetostatic treatment that has been adopted for such axially-symmetric magnetostatic problems and then to suggest an analogous treatment that might similarly be introduced into the program to permit solution of similar electrostatic problems (again through the introduction of a prolate spheroidal boundary). THE IMPLEMENTATION AND USE OF ADA ON DISTRIBUTED SYSTEMS WITH HIGH RELIABILITY REQUIREMENTS Semiannual Progress Report, 5 Mar. 1982 - 31 Dec. 1986
J. C. Knight Aug. 1986 73 p
(NASA-CR-179842; NAS 1.26:179842; UVA/528213/CS87/109)
Avail: NTIS HC A04/MF A01 CSCL 09B
The general inadequacy of Ada for programming systems that must survive processor loss was shown. A solution to the problem was proposed in which there are no syntatic changes to Ada. The approach was evaluated using a full-scale, realistic application. The application used was the Advanced Transport Operating System (ATOPS), an experimental computer control system developed for a modified Boeing 737 aircraft. The ATOPS system is a full authority, real-time avionics system providing a large variety of advanced features. Methods of building fault tolerance into concurrent systems were explored. A set of criteria by which the proposed method will be judged was examined. Extensive interaction with personnel from Computer Sciences Corporation and NASA Langley occurred to determine the requirements of the ATOPS software. Backward error recovery in concurrent systems was assessed. B.G.

GENERALIZED NETWORK IMPLEMENTATIONS
John J. Jarvis, H. D. Ratliff, and Michael A. Trick 1986 97 p
(Contracts N00014-85-C-0797; N00014-83-K-0147)
(AD-A168296; AD-E900578; PDRC-86-03) Avail: NTIS HC A05/MF A01 CSCL 05/1

Generalized networks are an important class of optimization models, with uses in a wide variety of fields. This report describes the development and implementation of a generalized network algorithm. Jarvis et. al. recommend a generalized network model, system for closure optimization and planning (SCOPE), for crisis action deployment planning. In SCOPE, large generalized networks must be repeatedly solved. These networks have special structure, which results in computational advantages. In this report, a generalized network implementation is developed for solving very large generalized networks. This implementation includes new data structures for storing the basis, in-core/out-of-core handling of the arcs, and special handling of pure network structure. In this report, a detailed examination of the SCOPE model is provided and its effect on implementation issues is discussed. The SCOPE model is highly structured. This report demonstrates how this structure can be used to advantage. In a companion report extensive testing is presented which addresses the question what affects the computation time for a SCOPE model? GRA

A NETWORK ARCHITECTURE FOR DATA-DRIVEN SYSTEMS Final Report, 1 Aug. 1982 - 1 Aug. 1984
James E. McDonald Jul. 1985 71 p
(AD-A168764; AFWAL-TR-84-1186) Avail: NTIS HC A04/MF A01 CSCL 09/2

This technical report discusses the hardware and software constructs of a unique computer network designed by the author. The network is especially designed for a multiple computer system operating in a synchronous real-time simulation system environment. The network emulates a shared memory system but has the unique property of being serially linked. All currently available shared memory systems utilize parallel address and data transmission schemes that demand a close proximity of the computers. Now, due to the serial linking, the computers may be hundreds or thousands of meters apart. Innovative data-driven hardware and software concepts applied to the serially-linked shared-memory multi-computer structure allow network transmission and subsequent software execution to be commanded relative to the dynamics of shared data variables. This concept is contrasted to synchronous network transmission and software execution of conventional real-time multi-computer systems. GRA

OPTICAL COMPUTING BASED ON THE HOPFIELD MODEL FOR NEURAL NETS Annual Report
N. H. Hart May 1986 65 p
(Contract N00014-85-K-2036)
(AD-A168767; EO/MO-10) Avail: NTIS HC A04/MF A01 CSCL 06/4

Neural net models and their analogs present a new approach to signal processing that is collective, robust, and fault tolerant. The collective nature of processing means also high throughput where bandwidth or speed of the processing elements i.e., temporal degrees of freedom are traded by spatial degrees of freedom via massive interconnectivity of the elements (neurons) in the network. As a result neural nets can solve computationally extensive problems like those encountered for example in optimization, nearest neighbor search, inverse scattering in a matter of a few time-constants of the processing elements. In biological systems (the brain in particular) this is of the order of a tens of milliseconds since neurons operate with electronic conduction and hence can be made considerably faster with time constants approaching nano-seconds. Collective processing such artificial nets can therefore be extremely fast. The remarkable ability of neural nets in handling sketchy (erroneous or incomplete) information and their fault tolerance (graceful degradation in performance with element failure) make them particularly attractive in pattern recognition, robotics, and autonomous system intended to operate virtually unattended for long time periods. ELAND: AN EXPERT SYSTEM FOR THE CONFIGURATION OF LOCAL AREA NETWORKS APPLICATIONS
L. Tanca and S. Ceri 1986 30 p
(Rept-86-008; ETN-86-97941) Avail: NTIS HC A03/MF A01

A rule-based expert system for configuring Local Area Networks (LAN) and for designing distributed database applications over them is described. The system includes a general-purpose inference machine for solving synthesis problems, based on two separed modules: the Tree Traversal and the Matcher. The former performs a recursive descent on a tree-structured solution space and generates a description of requirements that the final solution should posses; the latter matches these requirements to existing commercial products. The inference machine and its concrete application to the design and configuration of LAN information systems are described. ESA

The system Local Area Network (LAN) is presented. This network is used for sequential information bit exchange between linked computers or computer periphery, and aims at a cheap and fast solution of so-called in-house data communication problems. Several LAN topologies, transmission techniques used in local networks, routing techniques used in LAN's, network allocation methods, and access methods are presented. The access methods CSMA/CD and token passing are compared. The specifications of the different LAN techniques are compared. The LAN standardization using the Open System Inteconnection reference model is explained. ESA

IMPLEMENTATION OF THE TWENTE UNIVERSITY MULTIPROCESSOR (TUMULT)-15 NETWORK INTERFACE FOR THE VME BUS
Gerard J. M. Smit and Paul Havinga May 1986 44 p
(INF-86-11; ISBN-90-365-0041-9; ETN-86-98519) Avail: NTIS HC A03/MF A01

The implementation of a multiprocessor interconnection network is presented. The implemented network inteconnects up to 15 processing elements in a ring topology. All the processing elements are identical and autonomous, which means that each element has its own private memory and a copy of a local operating

system. Each processing element is built up from standard VME-bus compatible modules. Implementation of the interface between the TUMULT network and the VME-bus is described. ESA

RAPID PROTOTYPING FACILITY FOR FLIGHT RESEARCH IN ARTIFICIAL-INTELLIGENCE-BASED FLIGHT SYSTEMS CONCEPTS
Eugene L. Duke, Victoria A. Regenie, and Dwain A. Deets Oct. 1986 19 p
(NASA-TM-88268; H-1367; NAS 1.15:88268) Avail: NTIS HC A02/MF A01 CSCL 09B

The Dryden Flight Research Facility of the NASA Ames Research Facility of the NASA Ames Research Center is developing a rapid prototyping facility for flight research in flight systems concepts that are based on artificial intelligence (AI). The facility will include real-time high-fidelity aircraft simulators, conventional and symbolic processors, and a high-performance research aircraft specially modified to accept commands from the ground-based AI computers. This facility is being developed as part of the NASA-DARPA automated wingman program. This document discusses the need for flight research and for a national flight research facility for the rapid prototyping of AI-based avionics systems and the NASA response to those needs. Author

RESEARCH IN ADAPTIVE AND DECENTRALIZED STOCHASTIC CONTROL. Final Report, 15 Mar. 1984 - 14 Nov. 1985
Steven I. Marcus Jan. 1986 9 p
(Grant AF-AFOSR-0084-84)
(AD-A168752; AFOSR-86-0295TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

Significant progress was made in a number of aspects of stochastic systems. The problem of adaptive control of priority assignment in queueing systems was solved. A distance-measures approach to the problem of approximation and identification of queueing systems was studied. A problem of adaptively controlling a discounted-reward finite-state Markov decision process was solved. Major new results were obtained for the problem of adaptive control with incomplete observations. In particular, the author studied in depth a problem of adaptive control with incomplete observations, in which the state is a finite state Markov process. In addition, earlier work on asymptotic approximations in non-linear filtering was completed. Author (GRA)

THE EXTRACTION OF KNOWLEDGE FROM DATA: AN EVALUATION OF INTELLIGENT KNOWLEDGE BASED SYSTEMS (IKBS)
J. B. Bell Aug. 1983 13 p
(BAe-BT-15035; LR49007; ETN-86-97970) Avail: NTIS HC A02/MF A01

Automatic target recognition (ATR) by a sensor-computer system, and analogies with human visual perception are discussed. The best approach to ATR modeling may not involve detailed replication of the brain's processing steps in recording the sensory input. However, the general logic of the brain is relevant, including ways of eliminating redundant information, ways of using selected feature extractors as building blocks at each level of restriction such as position on the generality of the feature, and the use of fuzzy logic to provide continuously variable levels of stringency in the encoding process. The early stages of visual processing were incorporated in the VISIVE program, enabling information on important details in a scene to be extracted. ESA

DISCRETIZATIONS FOR MULTIGRID METHODS
Ulrich Ruede Aug. 1985 9 p
(TUM-I8519; TUM-INFO-08-85-I19-280/1-FMA; ETN-86-98230)
Copyright. Avail: Issuing Activity

An ordinary differential equation and a two-dimensional Poisson's equation are used as model problems to compare multigrid algorithms using parameterized discretizations for different parameter values. The discretization parameters for the relaxations are tuned so that the high frequency solution components are well represented; the parameters for the calculation of the residual are chosen so that the low frequency components are well represented. This concept improves the final solution errors relative to the exact solution of the continuous problem by one order of magnitude for high frequency modes, the errors becoming smaller than the discretization errors on the finest grid. The discretizations are designed using an approximate Fourier mode analysis neglecting boundary conditions and tested numerically. ESA

NUMERICAL METHODS FOR THE SOLUTION OF ORDINARY DIFFERENTIAL EQUATIONS: INITIAL VALUE PROBLEMS
Jul. 1986 28 p
(ESDU-86011; ISBN-0-85679-563-1; ISSN-0141-3988) Avail:

ESDU

This Data Item ESDU 86011 is an addition to the Dynamics Sub-series. Methods are presented for solving numerically a set of first-order differential equations with an equal number of initial conditions specified at a single value of the independent variable. A differential equation of order greater than one can also be solved by the methods provided the highest derivative of the dependent variable can be isolated. Two classes of method are covered: single-step methods (specifically Runge-Kutta) and multi-step (specifically predictor-corrector). For Runge-Kutta, formulae are included for five fourth-order method (and several lower-order techniques), and offer flexibility between reducing truncation error and computation time. For predictor-corrector, formulae are given for three approaches and, in two cases, are provided for a number of different orders. The difficulties met with instability and stiff equations are briefly considered. The methods do not apply to boundary value problems or partial differential equations. ESDU

TRANSFORMATION OF TWO AND THREE-DIMENSIONAL REGIONS BY ELLIPTIC SYSTEMS Semiannual Status Report, 15 Nov. 1985 - 14 May 1986

C. Wayne Mastin and Joe F. Thompson 3 Jul. 1986 22 p

(Grant NsG-1577)

(NASA-CR-179851; NAS 1.26:179851) Avail: NTIS HC A02/MF A01 CSCL 12A

Efforts in transferring computational work from the LRC computer to the IRIS Graphics Workstation at MSU are reported and the computation of a conservative solution of a simple hyperbolic equation on an overlapping grid is discussed. Several conclusions concerning computations on overlapping grids are apparent. Problems only occur when there is a major difference in grid spacing on the individual component grids. In the case of hyperbolic equations, it is necessary that both interpolation and extrapolation be applied at the grid boundaries. When interpolated values are used at outflow boundary points, excessive oscillations in the numerical solution may be the result. The same conclusions would be valid for more complicated systems of hyperbolic equations such as the Euler equations for inviscid flow. Some of the solution values would be extrapolated at the overlap boundary, the exact number depending on the number of characteristics pointing out of the overlap region. It is also possible that similar boundary conditions may be needed for some parabolic equations such as high Reynolds number viscous flow equations. Efforts were also expended on the development of three-dimensional conservative interpolation procedures. Finally, the investigation of grid smoothing procedures were initiated during this reporting period. It was decided that the first grid smoothing algorithms will be based on the concepts of variational grid generation. M.G.

EIGENVALUE ASSIGNMENT STRATEGIES IN ROTOR SYSTEMS Final Report

John N. Youngblood and Kennth J. Welzyn Oct. 1986 95 p

(Grant NAG8-034)

(NASA-CR-179906; NAS 1.26:179906; BER-389-177) Avail: NTIS HC A05/MF A01 CSCL 12A

The work done to establish the control and direction of effective eigenvalue excursions of lightly damped, speed dependent rotor systems using passive control is discussed. Both second order and sixth order bi-axis, quasi-linear, speed dependent generic models were investigated. In every case a single, bi-directional control bearing was used in a passive feedback stabilization loop to resist modal destabilization above the rotor critical speed. Assuming incomplete state measurement, sub-optimal control strategies were used to define the preferred location of the control bearing, the most effective measurement locations, and the best set of control gains to extend the speed range of stable operation. Speed dependent control gains were found by Powell's method to maximize the minimum modal damping ratio for the speed dependent linear model. An increase of 300 percent in stable speed operation was obtained for the sixth order linear system using passive control. Simulations were run to examine the effectiveness of the linear control law on nonlinear rotor models with bearing deadband. The maximum level of control effort (force) required by the control bearing to stabilize the rotor at speeds above the critical was determined for the models with bearing deadband. Author

M-ESTIMATION FOR DISCRETE DATA: ASYMPTOTIC DISTRIBUTION THEORY AND IMPLICATIONS Technical Report, Aug. 1985 - Aug. 1986

Douglas G. Simpson, Raymond J. Carroll, and David Ruppert Nov. 1985 23 p

(Contract F49620-82-C-0009)

(AD-A168532; MIMEO-SER-1586; AFOSR-86-0320TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

The asymptotic distribution of an M-estimator is studied when the underlying distribution is discrete. Asymptotic normality is shown to hold quite generally within the assumed parametric family. When the specification of the model is inexact, however, it is demonstrated that an M-estimator with a non-smooth score function, e.g., a Huber estimator, has a non-normal limiting distribution at certain distributions, resulting in unstable inference in the neighborhood of such distributions. Consequently, smooth score functions are proposed for discrete data. GRA

MATCHING EXTENSION IN BIPARTITE GRAPHS. 1. INTRODUCTION AND TERMINOLOGY

M. D. Plummer Apr. 1986 17 p

(Contract N00014-85K-0488)

(AD-A168666) Avail: NTIS HC A02/MF A01 CSCL 12/1

All graphs in this paper will be finite and connected and will have no loops or parallel lines. Let n and p be positive integers with n < or = (p - 2)/2 and let G be a graph with p points having a perfect matching. Graph G is said to be n-extendable if every matching of size n in G extends to a perfect matching. This paper is concerned primarily with studying n-extendability in bipartite graphs. In the first section of this paper the author gathers together the various characterizations of 1-extendable bipartite graphs mentioned above and then give the natural generalizations to n-extendability with a unified proof of the equivalencies. In another paper the author presented some results on the connectivity of general n-extendable graphs. In the second section of this paper proves a result about connectivity which is peculiar to the bipartite case. GRA

DYNAMIC GRID MANIPULATION FOR PDES (PARTIAL DIFFERENTIAL EQUATIONS) ON HYPERCUBE PARALLEL PROCESSORS

William D. Gropp Mar. 1986 13 p

(Contract N00014-82-K-0184; Grant AF-AFOSR-0360-84)

(AD-A168679; YALE/DCS/RR-458) Avail: NTIS HC A02/MF A01 CSCL 09/2

Adaptive methods for partial differential Equations can be considered as a problem in managing a dynamic graph on a parallel processor. The properties we want for this graph are that edges in the graph, as much as possible, map to nearest neighbor links in the parallel processor, and that changes to the graph not require a major re-arrangement of the mapping of the nodes of the graph onto the processor. We will discuss a simple restricted set of transformations which are easy to implement on a message passing parallel processor, and discuss in detail the design choices made. These transformations are based on maintaining a graph of bounded node degree at the cost of a small amount of global communication. In designing adaptive algorithms of parallel processors, the communication speeds of the processors can have a major effect on the design. Different hypercubes can be characterized by three parameters: the floating point speed, the I/O startup time, and the I/O transfer rate. One aspect of algorithm design which is influenced by interprocessor communication is data structure granularity. We will discuss how this affects the choice of algorithm as a function of the three parameters for our algorithm and relate this to our experiments. Author (GRA)

SYSTOLIC ARRAY SYNTHESIS: COMPUTABILITY AND TIME CONES
Jean-Marc Delosme and Ilse C. Ipsen May 1986 23 p
(Contracts N00014-82-K-0184; N00014-84-K-0092; N00014-85-K-0461; Grant NSF ECS-83-14750)
(AD-A168697; YALEU/DCSRR-474) Avail: NTIS HC A02/MF A01 CSCL 09/2

Many important algorithms in signal and image processing, speech and pattern recognition of matrix computations consist of coupled systems of recurrence equations. Systolic arrays are regular networks of tightly coupled simple processors with limited storage that provide cost effective high throughput implementations of many such algorithms. While there are some mathematical techniques for finding efficient schedules for uniform recurrence equations, there is no general theory for more general systems of recurrence equations. The first elements of such a theory are presented in this paper and constitute a significant step towards establishing a complete methodology that determines systolic array implementations for a very general class of coupled systems of recurrence equations; these implementations exhibit provably optimal computation time while satisfying various user-specified constraints. OPTIMAL SAMPLING RATES FOR AUTO REGRESSIVE MODELS
T. G. Ryall Apr. 1986 19 p
(AD-A168740; ARL-STRUC-TM-435) Avail: NTIS HC A02/MF A01 CSCL 12/1

In time series analysis a particular model for a linear system is an autoregression model. Autoregression models are particularly well suited to structural linear systems which have been persistently excited by white noise. The white noise is assumed to be unmeasurable and it is assumed that there is no measurement noise. The variability of the results obtained in practice tends to depend on the sampling rates used. This memo examines in detail the asymptotic convariance matrix for estimates of the damping rate and frequency for a fixed length of record and variable sampling rates in a linear system which is completely described, in continuous time, by a single second order differential equation. It is shown that the selection of sampling rate plays an extremely important role in the quality of estimates. GRA

RECONSTRUCTION OF TWO-DIMENSIONAL SIGNALS FROM THE FOURIER TRANSFORM MAGNITUDE Ph.D. Thesis
David Izraelevitz Jun. 1986 161 p
(Contract N00014-81-K-0742; Grant NSF ECS-84-07285)
(AD-A168792; TR-517) Avail: NTIS HC A08/MF A01 CSCL 09/3

This thesis is concerned with the problem of reconstructing a discrete two-dimensional signal of known support from the Fourier transform magnitude only. This problem arises in many fields where imaging is desired, such as astronomy and wavefront sensing. Since the autocorrelation function is easily calculated from the Fourier transform magnitude, we attack the equivalent problem of signal reconstruction from a known autocorrelation function. The main result of the thesis is a new algorithm for realizing this reconstruction. This algorithm is guaranteed to yield the correct solution given accurate measurements and is much more computationally attractive than previous reconstruction algorithms. The result is based on the detailed analysis of the zeros of a polynomial which is essentially the two-dimensional z-transform of the known autocorrelation signal. From this analysis, a large numbers of zeros of the z-transform of the unknown discrete signal are extracted. This set of zeros is then used to extract the signal values via the solution of a set of linear equations. Examples of the application of this algorithm to several families of images is presented, along with a discussion of the accuracy and computational requirements of the new algorithm. We conclude with a discussion of the application of the ideas of this thesis to the area of two-dimensional filter design and stability testing. Author (GRA)

ERROR ESTIMATES FOR DIFFERENTIAL-ALGEBRAIC EQUATIONS
B. J. Leimkuhler Jun. 1986 54 p
(Contract DE-AC02-76ER-02383)
(DE86-012492; DOE/ER-02383/0124; UIUCDCS-R-86-1287; UILU-ENG-86-1741; COO-2383-0124) Avail: NTIS HC A04/MF A01

Recent work has shown that variable stepsize BDF (backward-differentiation formulas) methods converge for a large class of differential-algebraic equations (DAE) of index no greater than two; however, the usual error estimate based on the predictor-corrector difference is not accurate for index-2 problems and can lead to failure in numerical codes. Current research on the error estimation problem for DAEs is surveyed, and a promising alternative estimate based on a projection of the predictor-corrector difference is discussed and numerically tested. ON REALIZATION OF NONLINEAR SYSTEMS DESCRIBED BY HIGHER-ORDER DIFFERENTIAL EQUATIONS

A. J. vanderSchaft Jun. 1986 59 p

(Memo-569; ETN-86-98516; ISSN-0169-2690) Avail: NTIS HC A04/MF A01

Systems of smooth nonlinear differential and algebraic equations with external variables are studied. The realization problem is to replace the higher-order implicit differential equations by first-order explicit differential equations and the algebraic equations by mappings to the external variables. This involves the introduction of state variables. It is shown that under general conditions there exist realizations containing a set of auxiliary variables, called driving variables. Sufficient conditions for the existence of realizations involving only state variables and external variables, which can be split into input and output variables are given. It is shown that there are structural obstructions for the existence of such realizations. A constructive procedure to obtain realizations with or without driving variables is presented. The realization procedure is also applied to systems defined by interconnections of state space systems. A theory of equivalence transformations of systems of higher-order differential equations is developed. ESA

USE OF FUZZY SETS MATHEMATICS TO ASSIST PAVEMENT EVALUATION AND MANAGEMENT. EXECUTIVE SUMMARY (REVISED MARCH 18, 1986) Final Report

M. Andonyadis, A. G. Altschaeffl, and J. L. Chameau Jun. 1985 11 p Sponsored in part by Federal Highway Administration and Indiana Dept. of Highways

(PB86-214780; FHWA/IN/JHRP-85/14-ES-Rev; JHRP-85-14-ES-Rev) Avail: NTIS HC A02/MF A01 CSCL 13B

This report applies the mathematics of fuzzy sets that was created in the companion interim Report by Gunaratne, et al. The new scheme being suggested for pavement management is predicted on the presence of uncertaintly at various stages in pavement management which requires that judgment be used in the process. The fuzzy sets mathematics can methodically combine subjective information and crisp measurement data. Fuzzy sets are used to represent the subjectivity in pavement serviceability ratings and distress surveys, and the variability in Roadmeter, Skid-Tester and Dynaflect readings. The ranking of pavements is formulated using fuzzy multi-attribute decision-making concepts using an expert knowledge base. To use the new scheme required the one-time development of the knowledge base. GRA

N87-12299# Yale Univ., New Haven, Conn. School of Forestry and Environmental Studies.

CONTROLLING OUTLIERS IN CONTINGENT VALUATION EXPERIMENTS Final Report

R. Mendelsohn Apr. 1986 26 p

(Contract EPA-68-01-6596)

(PB86-210465; EPA 230/06-86-015) Avail: NTIS HC A03/MF A01 CSCL 12A

There is no established protocol for the analysis of data collected in contingent valuation surveys. This had led to seemingly arbitrary removal of some outlier observations, which leads to questions about the representativeness of the results reported in the literature. The report critiques the methods researchers have used to analyze the data from contingent valuation surveys and suggests procedures for future analyses. Three procedures regress the response on a set of economic and demographic variables (e.g., income, age, sex, prices). Then if the unweighted residuals appear to be normally distributed, analysis should proceed. The first process would drop outliers (iteratively) that are more than (say) six standard deviations from the mean response. The second process would weight observations close to the regression line more heavily than those further away, so that those with true extreme preferences are not eliminated. The third procedure would incorporate known independent sources of bias in the regression. A fourth approach would examine the median response rather than the mean; this would be more like a voting outcome but ignores extreme preferences. Testing of competing approaches is recommended. GRA

ON THE USE OF RIDGE AND STEIN-TYPE ESTIMATORS IN PREDICTION
Alan E. Gelfand 21 May 1986 26 p
(Contract N00014-86-K-0156)
(AD-A168349; TR-374) Avail: NTIS HC A03/MF A01 CSCL 12/1

For the usual regression model with fixed regressors, there is a considerable literature devoted to alternatives to ordinary least squares estimators of the regression parameters. These alternatives are biased with small variances resulting in reduced mean square error over some (perhaps all) of the parameter space. Two prominent classes of such estimators are ridge type and Stein type estimators. Consider the simplest prediction problem in this context, i.e., prediction at a single new vector of prediction values. The risk (squared error) is calculated for predictors based on estimators in the above families. While the ordinary least squares predictor is admissible, a simulation study reveals that over regions of the parameter space substantial reduction in risk is possible using estimators in these families. A simple preliminary procedure based upon the vector of prediction values is given to select a good estimator from these families. It is apparent that in multiple prediction a single choice of estimator need not be best. GRA

DFR (DECREASING FAILURE RATE) PROPERTY OF FIRST PASSAGE TIMES AND ITS PRESERVATION UNDER GEOMETRIC COMPOUNDING
J. G. Shanthikumar Jan. 1986 20 p
(Grant AF-AFOSR-0205-84)
(AD-A168671; AFOSR-86-0275TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

It is shown that if the transition kernel of a discrete time Markov chain with state space (0,1,...) is totally positive of order two (TP2), the first passage time from state 1 to state 0 has decreasing failure rate (DFR). This result is used to show that (i) the sum of a geometric number (i.e., geometric compound) of i.i.d. DFR random variables is DFR and (ii) the number of customers served during a busy period in an M/G/1 queue with increasing failure rate service times is DFR. Recent results of Szekli (1986) and the closure property of i.i.d. DFR random variables under geometric compounding are combined to show that the stationary waiting time in a GI/G/1 (M/G/1) queue with DFR (increasing mean residual) service times is DFR. We also provide sufficient conditions on the inter-renewal times under which the renewal function is concave. These results shed some light on a conjecture of Brown (1981). Author (GRA)

INFORMATION CAPACITY OF THE MISMATCHED GAUSSIAN CHANNEL
Charles R. Baker Dec. 1985 38 p
(Contracts N00014-81-K-0373; N00014-84-C-0212)
(AD-A170255) Avail: NTIS HC A03/MF A01 CSCL 09/4

Information capacity is determined for the additive Gaussian channel when the constraint is given in terms of a covariance different from that of the channel noise. These results, combined with previous results on capacity when the constraint covariance is the same as the noise covariance, provide a complete and general solution for the information capacity of the Gaussian channel without feedback. They are valid for both continuous-time and discrete-time channels, and require only two assumptions: the noise energy over the observation period is finite (w.p.l.), and the constraint is given in terms of a reproducing kernel Hilbert space norm. Applications include channels with ambient noise having unknown covariance, and channels subject to jamming. The results for the mismatched channel differ markedly from those for the matched channel. A CENTRAL LIMIT THEOREM FOR MARKOV PATHS AND SOME PROPERTIES OF GAUSSIAN RANDOM FIELDS Technical Report, Sep. 1985 - Aug. 1986
Robert J. Adler and R. Epstein Feb. 1986 62 p
(Contract F49620-85-C-0114)
(AD-A170258; TR-134; AFOSR-86-0380TR) Avail: NTIS HC A04/MF A01 CSCL 12/1

Our primary aim is to build versions of generalized Gaussian processes from simple, elementary components in such a way that as many as possible of the esoteric properties of these elusive objects become intuitive. For generalised Gaussian processes, or fields, indexed by smooth functions or measures on R sub d, our building blocks will be simple Markov processes whose state space is R sub d. Roughly speaking, by summing functions of the local times of the Markov processes we shall, via a central limit theorem type of result, obtain the Gaussian field. This central limit result, together with related results indicating how additive functionals of the Markov processes generate additive functionals of the fields, yield considerable insight into properties of generalised Gaussian processes such as Markovianess, self-similarity, locality of functionals, etc. Although the paper is comprised primarily of new results, and despite the fact that the subject matter is somewhat esoteric, our aims are primarily didactic and expository - we want to try to initiate the uninitiated into some of the mysteries of generalised processes via an easily understood model. ASYMPTOTIC DISTRIBUTIONS OF FUNCTIONS OF THE EIGENVALUES OF THE SAMPLE COVARIANCE MATRIX AND CANONICAL CORRELATION MATRIX IN MULTIVARIATE TIME SERIES
M. Taniguchi and P. R. Krishnaiah Mar. 1986 35 p
(Contracts F49620-85-C-0008; N00014-85-K-0292)
(AD-A170282; TR-86-08; AFOSR-86-0357TR) Avail: NTIS HC A03/MF A01 CSCL 12/1

This paper discusses the asymptotic distributions of eigenvalues of sample covariance matrices of multivariate time series since the eigenvalues play a fundamental role in multivariate problems. Section 2 gives the limiting distribution of eigenvalues of sample covariance matrices for non-Gaussian linear vector processes. Further Section 3 derives the asymptotic expansions of certain functions of eigenvalues of covariance matrix for multivariate Gaussian stationary processes and discuss their applications for time series principal component analysis. In Section 4 the author gives the asymptotic expansions of certain functions of canonical correlation matrix for multivariate Gaussian stationary processes, and discusses some asymptotic properties of a test statistic for canonical correlations. METHODS FOR CALCULATING THE PROBABILITY DISTRIBUTION OF SUMS OF INDEPENDENT RANDOM VARIABLES Final Report
George J. Schlenker Jul. 1986 79 p
(AD-A170465; AMSMC/SA/MR-8) Avail: NTIS HC A05/MF A01 CSCL 12/1

This report surveys numerical methods for obtaining the probability distribution of a sum of statistically independent random variables. Study objectives are to investigate the relative accuracy and computational effort for each of the following methods: (1) evaluation of closed-form solutions for particular cases, (2) discrete numerical convolution of probability densities, (3) Normal probability approximation to the distribution of a sum, (4) numerical inversion of the Laplace transform of the convolution, (5) Erlang approximation for convolutions of a two-parameter Weibull distribution, (6) convolution of probability densities using the FFT algorithm for calculating finite Fourier transforms, and (7) Monte-Carlo simulation. Methods are sketched for deriving analytic expressions for the distribution of the sum of RVs of certain distributions. Each numerical method is described and illustrated using RVs from several distributional forms, such as uniform, exponential, gamma, and Weibull, as well as mixture models. In terms of run time and accuracy, some methods are particularly suited to certain distributional forms. If problem applications are quite special and if the time for program coding (as well as running) is a consideration, Monte-Carlo simulation may be the preferred method. All computer source programs are listed in annexes. GRA

COMPARISON OF MAXIMUS/BOUNDING AND BAYES/MONTE CARLO FOR FAULT TREE UNCERTAINTY ANALYSIS
S. C. Hora (Hawaii Univ., Hilo.) and R. L. Iman Mar. 1986 71 p
Prepared in cooperation with Sandia National Labs., Albuquerque, NM.
(Contract DE-AC04-76DP-00789)
(DE86-011704; SAND-85-2839) Avail: NTIS HC A04/MF A01

A comparison of two methodologies for the analysis of uncertainty in risk analyses is presented. One methodology combines approximate methods for confidence interval estimation of system reliability with a bounding approach for information derived from expert opinion. The other method employs Bayesian arguments to construct probability distributions for component reliabilities using data from experiments and observation and expert opinion. The system reliability distribution is then derived using a conventional Monte Carlo analysis. An extensive discussion of the differences between confidence intervals and Bayesian probability intervals precedes the comparison. The comparison is made using a trial problem from the Arkansas Nuclear One-Unit 1 Nuclear Power Plant. It is concluded that the Maximus/Bounding methodology tends to produce somewhat longer intervals than the Bayes/Monte Carlo method, although this finding is based on comparisons made under nonidentical assumptions regarding the treatment of operator recovery rates. The Bayes/Monte Carlo method is shown to produce useful information regarding the importance of uncertainty about each component's reliability in determining overall uncertainty. DOE

COMPUTATION OF THE INVARIANT PROBABILITY OF A NONLINEAR STOCHASTIC SYSTEM AND APPLICATIONS TO QUEUEING SYSTEMS
B. N. Bui, S. Baudas, M. Grojnowski, and H. Korezlioglu Nov. 1985 11 p
(ENST-85D007; ISSN-0751-1345; ETN-86-97866) Avail: NTIS HC A02/MF A01

A method of computation or approximation of the stationary probability of a pair of discrete time stochastic processes, taking their values in finite spaces is presented. One of the processes is considered as a Markovian state process and the other is an observation process. The model can be used in the study of nonlinear transmission channels and voice packet transmission local area networks. The method, inspired from the study of random walks, is a recurrence method and can be extended to more complicated situations. ESA

THE NONLINEAR SIGMA MODEL: THREE LOOPS RENORMALIZATION AND LATTICE SCALING

M. Falcioni and A. Treves 19 Jun. 1985 27 p
(Preprint-466; ETN-86-97901) Avail: NTIS HC A03/MF A01

The first nonuniversal terms of the renormalization group functions for the nonlinear sigma-model regularized on a lattice, for a choice of different lattice actions were calculated. Such terms fix the leading corrections to universal asymptotic scaling. However, comparison with Monte Carlo simulations shows that the actual deviations from universal scaling are due to nonperturbative effects, and not to perturbative analytic corrections. The latter are nonetheless relevant to determine the ratios of scaling operators to lambda-parameters. ESA

MONOTONICITY OF RANK STATISTICS IN SOME NONPARAMETRIC TESTING PROBLEMS
B. F. Schriever Sep. 1985 17 p
(Rept-292; B8575511; ETN-86-98523) Avail: NTIS HC A02/MF A01

For nonparametric testing problems (one-sided two-sample problem, k-sample trend problem, testing independence against positive dependence) a partial ordering over the alternatives is defined. This partial ordering expresses the strength of the deviation from the null-hypothesis. All familiar rank tests turn out to be more powerful under increasing alternatives; that is, all familiar rank statistics preserve the ordering stochastically in samples whenever it is present between underlying distributions. As a tool, the sample equivalence of the ordering is introduced as a partial ordering over pairs of permutations. Functions, defined on pairs of permutations, which preserve this ordering are studied. ESA

STOCHASTIC INTEGRATION FOR OPERATOR VALUED PROCESSES ON HILBERT SPACES AND ON NUCLEAR SPACES
H. Korezlioglu and C. Martias Mar. 1986 60 p Revised
(Contract F49620-85-C-0144)
(AD-A168501; TR-85; AFOSR-86-0326TR) Avail: NTIS HC A04/MF A01 CSCL 12/1

The representation of a nuclear space valued square integrable martingale by means of another nuclear space valued square integrable martingale is given in terms of stochastic integrals of operator valued processes. The construction of the stochastic integral goes through that of operator valued processes on Hilbert spaces. A new approach is given for the Hilbertian case, so that only the integration of Hilbert-Schmidt operator valued processes is needed to represent square integrable martingales.

CLASSIFICATION OF WEAKLY INFINITE-DIMENSIONAL SPACES AND ESSENTIAL MAPPINGS
Piet Borst Jul. 1985 79 p
(Rept-289; B8575510; ETN-86-98521) Avail: NTIS HC A05/MF A01

A classification of weakly infinite-dimensional spaces is given by introducing the weak large transfinite dimension w-Ind. This function coincides with the covering dimension dim in the finite case. The classification provided by w-Ind is the same as the one given by Pol's (1983) index for weakly infinite-dimensional compact metric spaces. Results concerning the relation between w-Ind and essential mappings into Henderson's (1968) cubes J sup alpha, where alpha is a countable ordinal number are obtained. It is proved that for a compact metric space X, the following statements are equivalent: index X is greater than or = omega 0 sup alpha (ordinal exponentiation); w-Ind X is greater than or = alpha; there exists an essential mapping of X x C, the product of X with the Cantor set, to J sup alpha. ESA

LINEAR AND ROTATIONAL ACCELERATION OF A 3D RIGID BODY
K. S. Khan 26 Sep. 1984 12 p
(MED-Info-Sheet-715; LR50995; ETN-86-97953) Avail: Issuing Activity

Rigid body equations of motion based on kinematics principles are derived for accelerometers clustered at and around the center of gravity. Six and nine-accelerometer arrangements are compared. Results show that to compute correct accelerations at a point by employing rigid body kinematics, the angular velocities should be included in the equations. The choice of the location of accelerometers is the key to the solution of rigid body motion problems, i.e., the equations are much simpler to handle for accelerometers stationed at the body axes. The six-accelerometer configuration requires stepwise integrations for the evaluation of rotational accelerations. Step integration may accumulate errors and show instability. The nine accelerometer configuration is much more reliable, since it does not require stepwise integration. Rotational velocities and rotations can be found by integrating the rotational accelerations. ESA

(Contract NAS1-17263)
(NASA-CR-172490; NAS 1.26:172490) Avail: NTIS
HC A08/MF A01 CSCL 20A

A theoretical and experimental study was performed to devise lightweight sidewalls for turboprop aircraft. Seven concepts for new sidewalls were analyzed and tested for noise reduction using flat panels of 1.2 m x 1.8 m (4 ft x 6 ft), some of which were aircraft-type constructions and some of which were simpler, easier-to-construct panels to test the functioning of an acoustic principle. Aircraft-application sidewalls were then conceived for each of the seven concepts, and were subjectively evaluated for their ability to meet aircraft nonacoustic design requirements. As a result of the above, the following sidewall concepts were recommended for further investigation: a sidewall in which the interior cavity is vented to ceiling and underfloor areas; sidewalls with wall-mounted resonators, one having a conventional trim panel and one a limp one; and a sidewall with a stiff outer wall and a limp trim panel. These sidewalls appear to promise lower weights than conventional sidewalls adjusted to meet similar acoustic requirements, and further development may prove them to be practical. Author

TWO METHODS FOR CALCULATING ACOUSTIC WAVE PROPAGATION THROUGH AN INTERFACE
Come Crance Jan. 1986 134 p Transl. into ENGLISH from "Presentation de Deux Methodes de Calcul de Propagation dOndes Acoustiques en Presence dUn Dioptre" (Chatillon, France) Original language document was announced as N86-18128
(ESA-TT-955; ONERA-NT-1985-2; ETN-86-98243) Avail: NTIS
HC A07/MF A01

Two methods for calculating the amplitudes of acoustic waves propagated through a plane boundary are presented. The first is analytical and is based on the Cagniard method. It is used for solving the reflection and transmission of pulsed waves from an infinite line source or a point source at an infinite plane boundary separating two media with different acoustic velocities and densities; and the reflection of an acoustic pulse from an infinite line source or a point source at a plane boundary described as a surface of acoustic impedance Z. The second method is based on a fast Fourier transform algorithm. It is used to evaluate Sommerfeld type integrals. Its results are compared with those given by the stationary phase method and by the geometrical acoustics approximation. ESA

(ESA-TT-957; DFVLR-FB-85-32; ETN-86-98244) Avail: NTIS
HC A03/MF A01; original German version avail. at DFVLR, Cologne, West Germany DM 11

Sound propagation in radial fan hollow casings was studied

for cylindrical and spiral-shaped casings of the same volume and width. After measurement of the sound reflection through the different casings a monopole or dipole sound source of reduced expansion at the casing cut-off was introduced and the frequency responses in the intake and outflow canals determined. The influence of casing geometry and the flow in the casing on the rejection level and on the system frequency responses was determined. The applicability of the one-mode approximation for description of the frequency responses was verified. Torsional sound in the outflow canal can be reduced with a phase-variable sound source synchronous with the rotation frequency at the cut-off. ESA

STATISTICAL MECHANICS OF CHARGED OBJECTS: GENERAL METHOD AND APPLICATIONS TO SIMPLE SYSTEMS
Y. Rosenfeld and L. Blum 27 May 1986 51 p
(Contract N00014-81-C-0776)
(AD-A168918; TR-21) Avail: NTIS HC A04/MF A01 CSCL 20/13

Real fluids are composed of molecules that are objects of complex geometries and charge distributions. By studying the asymptotic high density limit (AHDL) and the asymptotic strong coupling limit (ASCL) one is able to reduce the problem of computing the thermodynamics and correlation functions of the system to a geometrical calculation involving overlap integrals between the objects. In previous work a simple geometrical, physically intuitive meaning of the direct correlation functions (dcf) I for point charges in a background (as interactions between smeared charges) and hard sphere (as overlap volumes) within the mean spherical approximation (MSA) was given, thus also revealing its analytic structure. A general variational approach to study a system composed of complex charged molecules is discussed. In this approach the variational trial functions for the free energy functional are constructed from the asymptotic limiting (AL) forms of the direct correlation functions. A number of examples are discussed, and in each case the variational form of the direct correlation is given explicitly. The relation to Onsager's procedure of immersing the system in a infinite conducting fluid of obtaining an energy bound is discussed in detail. GRA

RELEVANCE AT AN INTERMEDIATE-RANGE FORCE FOR NEUTRON-ANTINEUTRON OSCILLATION EXPERIMENTS
F. Massa 14 Mar. 1986 6 p
(Nota-Interna-864; ETN-86-97897) Avail: NTIS HC A02/MF A01

The existence of a massive hyperphoton coupled either to the hypercharge or to the baryonic quantum number is discussed. The former possibility is ruled out since a coupling to the hypercharge would lead to a rate for process K(+) yields pi(+) + gamma m (a real hyperphoton) much larger (more than three orders of magnitude) than the upper bound established experimentally for the occurrence of this process. The effect of this interaction on the possible observation of neutron-antineutron oscillations with a free neutron beam is considered. ESA

STRANGE DIBARYONS
G. dAgostini, G. Auriemma, G. Marini, G. Martellotti, F. Massa, A. Nigro, A. Rambaldi, A. Sciubba, J. P. deBrion, A. Caillet et al 26 Mar. 1986 31 p Presented at Topical Seminar on Few and Many Quark Systems, Pisa, Italy, 25-29 Mar. 1985
(Nota-Interna-865; ETN-86-97898) Avail: NTIS HC A03/MF A01

Dibaryonic systems with strangeness S=-2 and S=-1 were studied with a missing mass spectrometer, searching for narrow structures in a mass interval in the neighborhood of the YN, YY thresholds (between 2.0 and 2.5 GeV/csq). No evidence for the presence of structures is found in the reaction K(-)d yields K(+) + MM (B=2, I=1, S=-2) and in the reactions K(-)d yields pi(+) + MM, pi(-)d yields K(+) + MM (B=2, I=3/2, S=-1), at 1.4 GeV/c incident momentum. The production of a strange dibaryonic system (B=2, I=1/2, S=-1) called H1(+) (M=2130 MeV/csq) was studied with incident momenta between 0.9 and 1.4 GeV/c, in the reaction K(-)d yields pi(-) + H1(+) and in the line reversed reaction pi(+)d yields K(+) + H1(+). MULTICHANNEL NONPOTENTIAL SCATTERING THEORY
R. Mignani 17 Sep. 1985 28 p Submitted for publication
(Preprint-476; ETN-86-97911) Avail: NTIS HC A03/MF A01

Multichannel scattering theory is extended to the Lie-isotopic case, in order to take account of contact, nonpotential, nonhamiltonian forces among the colliding particles. It is shown that in the time dependent and in the stationary framework, the basic tools and equations of the conventional treatment (including channel propagators and wave operators, interchannel scattering and transition operators, and Lippmann-Schwinger equations) admit consistent generalizations to the nonpotential case. A two-isohilbert space formulation of the subject, based on the introduction of a Lie-isotopic asymptotic Hilbert space, is also presented. ESA

POWER SYSTEM APPLICATIONS OF FIBER OPTIC SENSORS
A. R. Johnston, S. P. Jackson, H. Kirkham, and C. Yeh Jun. 1986 85 p Sponsored in part by DOE
(NASA-CR-179921; JPL-Pub-86-22; NAS 1.26:179921; DOE/ET-29372/5) Avail: NTIS HC A05/MF A01 CSCL 20F

This document is a progress report of work done in 1985 on the Communications and Control for Electric Power Systems Project at the Jet Propulsion Laboratory. These topics are covered: Electric Field Measurement, Fiber Optic Temperature Sensing, and Optical Power transfer. Work was done on the measurement of ac and dc electric fields. A prototype sensor for measuring alternating fields was made using a very simple electroscope approach. An electronic field mill sensor for dc fields was made using a fiber optic readout, so that the entire probe could be operated isolated from ground. There are several instances in which more precise knowledge of the temperature of electrical power apparatus would be useful. This report describes a number of methods whereby the distributed temperature profile can be obtained using a fiber optic sensor. The ability to energize electronics by means of an optical fiber has the advantage that electrical isolation is maintained at low cost. In order to accomplish this, it is necessary to convert the light energy into electrical form by means of photovoltaic cells. JPL has developed an array of PV cells in gallium arsenide specifically for this purpose. This work is described. Author

DEVELOPMENT OF ALGORITHMS AND HARDWARE FOR STRUCTURED-LIGHT VISION Final Report
Murray H. Loew, Reza Momenan, Gao Shangkai, and James Hargrove 1986 319 p
(Contract N00014-83-K-0578)
(AD-A168197) Avail: NTIS HC A14/MF A01 CSCL 20/6

Computer vision is finding increased application in robotics and for shipbuilding, construction, machining, sorting, and inspection. An essential part of a computer vision system is the ability to measure range (distance) to points on the surfaces of three-dimensional objects. This information allows the description of such intrinsic characteristics of objects as orientation, surface condition, and dimensions. A goal of the work described here was the development, testing, and evaluation of a real-time system for measuring range, suitable for the kinds of applications described above. A second goal was the development of algorithms for description of objects, based on their range-image representations. We have shown the feasibility, and measured the performance, of a prototype ranging system that uses a technique called structured light; GWU has also derived and implemented algorithms for rapid description of a limited class of objects using only the data that would be supplied by such a system. Included are a FORTRAN computer program and the following papers: (1) PIPE: A Specialized Computer Architecture for Robot Vision; (2) A New Method for Characterization of Shape; (3) The Quadcode and Its Arithmetic; (4) Adjacency Detection Using Quadcodes. LARGE OPTICS TECHNOLOGY Final Report, 14 Apr. 1980 - 31 Dec. 1984
Robert R. Shannon 22 May 1986 28 p
(Contract N00014-80-C-0565)
(AD-A168222) Avail: NTIS HC A03/MF A01 CSCL 20/6

The purpose of this contract was to support and evaluate work done in the area of high energy laser beam projection systems. The principal areas of interest were the support of the DARPA LODE/LAMP/Alpha programs and particularly large optics technology. The contract was divided into three areas of importance: a review of the various project components to provide scientific engineering and technical assistance; the preparation of analyses as needed in the various project areas; and participation in specific technical meetings, including some proposal review. Another area of interest was the support of related work in the area of optics to provide technical information of importance to specific parts of the high-energy laser program. Reports were produced on the following subjects: Absolute Aspheric Measurement; Effect of Coatings on Aberrations; Modeling of Errors in Systems; Extrapolated Mean Square Methods; Subaperture testing; Absolute Measurement of Radius of Curvature; Wavefront Errors Produced by Multilayer Thin Film Optical Coatings; Analysis of alignment and Surface Figure Errors in Optical Systems; Extrapolated Least Squares Optimization Applied to Lens Design; and Testing of Large Telescopes. OPTICAL PHASE CONJUGATION VIA FOUR-WAVE MIXING IN BARIUM TITANATE M.S. Thesis
James R. Ryan Mar. 1986 72 p
(AD-A168908) Avail: NTIS HC A04/MF A01 CSCL 20/6

Optical phase conjugation is a nonlinear optical phenomenon that replicates a distorted electromagnetic wave. This process has potential in distortion correction, pointing and tracking, improved laser resonators, image enhancement, and optical communcations. Nonlinear effects that can produce a phase conjugate wave include; photorefraction, Brillouin scattering, Raman scattering, Kerr-like four-wave mixing, photon echoes, three wave mixing, and electro-restrictive effects. Photorefraction in a crystal of barium titanate can produce a phase conjugate replica of a laser beam through four-wave mixing. Barium titanate is unique because self generated conjugate returns will form from corner reflections. Self pumped optical phase conjugation was achieved at six wavelengths between 457.9 and 514 nm. Factors affecting the return included the laser wavelength, intensity, and angle of incidence with the c axis. The average return amounted to about 25% of the incident beam. The phase conjugate return interacted with the laser modes, significantly increasing the laser power. GRA

PHASE-ONLY OPTICAL FILTER FOR USE IN AN OPTICAL CORRELATION SYSTEM Patent
Joseph L. Horner, inventor (to Air Force) Issued 13 May 1986 16 p Supersedes AD-D011093
(AD-D012396; US-Patent-4,588,260; US-Patent-Appl-SN-596471; US-Patent-Class-350-162.13) Avail: US Patent and Trademark Office CSCL 20/6

A phase-only optical filter capable of being utilized within a phase-only optical correlation system is described. The phase-only optical filter is made by mathematically generating preselected phase-only information by a fast Fourier Transform technique. This generated phase-only information is transferred onto an unexposed holographic film. Therefore, the film is developed and subsequently bleached. The resultant bleached film is the phase-only filter which, when utilized in a correlation system, provides substantially 100% utilization of the source of electromagnetic radiation during the correlation process. FRESNEL LENS STUDY
May 1986 54 p Prepared in cooperation with Sandia National Labs.,Albuquerque, N. Mex.
(Contract DE-AC04-76DP-00789)
(DE86-012249; SAND-86-7034) Avail: NTIS HC A04/MF A01

Thick film sol-gel technology was evaluated to determine the feasibility of utilizing sol-gels to produce embossable materials ultimately for the production of all-glass Fresnel optics. The feasibility study has utilized the relatively undeveloped branch of organically modified sol-gels. The results of this work show that organically modified sol-gels possess properties which allow the formation of thick, patternable and adherent coatings. The study resulted in the fabrication of over 600 samples based on over 100 sol-gel formulations. Samples were evaluated for clarity, transmittance and other optical properties. Environmental tests were performed on selected groups. Although moderate success was obtained on producing a Fresnel lens layer bonded to glass, a fully densified lens was not achieved. The process and chemistries indicate that improvements based on these materials and techniques may lead to an acceptable all-glass Fresnel lens. DOE

P. Hollier, B. Laurent, F. Pasternak, P. Merat, P. Nicolas, J. Vermeiren, and B. Dierickx Paris ESA 1 Mar. 1986 305 p Partly in FRENCH and ENGLISH
(Contract ESTEC-6051/84-NL-PB(SC))
(Matra-094/PH/UB/137.85; ESA-CR(P)-2258; ETN-86-98135) Avail: NTIS HC A14/MF A01

A design and feasibility study of an instrument to produce thermal images of the Earth in 2 spectral bands between 10 and 12 microns is presented. The spatial resolution is 30 m and the radiometric resolution is 0.1 K. The study includes a parametric design and the analysis of problems due to the extension of the push-broom concept to the thermal infrared domain. A preliminary definition of the instrument is based on this analysis and shows that the high spatial resolution implies a mass on the order of 320 kg while for 50 m resolution that mass could be reduced to 120 kg. The development time of such an instrument is estimated as 8 yr. ESA

OBSERVATION WITH VIDEO EQUIPMENT IN THE WAVELENGTH RANGE 1.2 TO 2.0 MICROMETER
Carl Hugo Aagren Apr. 1986 21 p In SWEDISH; ENGLISH summary
(FOA-C-30417-E1; ISSN-0347-3708; ETN-86-98331) Avail: NTIS HC A02/MF A01; Swedish Inst. of National Defence, Stockholm, Sweden KR 50

A camera used in the near infrared range (NIR) which can be equipped with different image tubes was tested. The sensitive material is a mixture of PbO and PbS. When observations are limited to the higher wavelengths a carefully prepared filtration of the visible wavelength range must be carried out: types of filters are mentioned. All image generation observations in the 1.0 and 2.0 micrometer area are sharply influenced by water, the absorption band of which is between 1.3 and 1.5 for water vapor and 1.4 to 1.6 for liquid water and snow. Examples of snow photographs are given. A military application of video observation in NIR is the detection of winter camouflage. The NIR camera can also detect heat radiation from an object, but only when its temperature is above 200 C: this device is thus not competitive with IR cameras for this application. ESA

REDUCTION OF THE GENERAL SPITZER-HAERM PROBLEM IN PLASMA PHYSICS
Antonio Carlos deAlmeida Ferreira Aug. 1986 15 p Submitted for publication
(INPE-3978-PRE/989) Avail: NTIS HC A02/MF A01

The general Spitzer-Haerm problem is unfolded through a redefinition of the dependent variable into two separate simpler problems. The first takes the form of a second order differential equation, and the second that of an integration over the solution of the first problem, which provides the distribution function or, directly, the current and the heat flow. It is shown that the current and the heat flow can in general be synthesized from the solutions of the differential equation for two specific forms of the driving term. Author

THEORETICAL BEHAVIOR OF FULLY IONIZED MULTIPLE SPECIES MAGNETIZED PLASMAS UNDER ROTATION
J. A. Bittencourt Jun. 1986 59 p
(INPE-3915-RPE-510) Avail: NTIS HC A04/MF A01

A multiple species fluid model for a fully ionized, magnetized plasma under rotation is described. The basic fluid equations are the continuity and momentum equations for each species, including centrifugal, electromagnetic, pressure gradient and collisional forces, in cylindrical geometry. This model is used to describe the steady state behavior of the fully ionized cylindrical plasma column in a laser-initiated vacuum-arc plasma centrifuge. It is shown that there is a family of theoretically possible dynamical equilibrium configurations, which can be achieved by different combinations of ion rotation velocity, radial ion density distribution, and radial dependence of internal electric potential. A numerical analysis is presented which shows the radial distribution and parametric dependences of the various plasma parameters under equilibrium conditions, including the ion separation factor, considering a nickel-copper plasma. The numerical results are analyzed and discussed in light of experimentally measured plasma characteristics in a vacuum-arc plasma centrifuge. Author

A COMPUTATIONAL STUDY OF THE INFLUENCE OF MOLECULAR NITROGEN AND LASER ABSORPTION ON PLASMA CHANNEL FORMATION CREATED BY LASER RESONANCE SATURATION OF SODIUM VAPOR
Silvester Siu Kai Wong Apr. 1986 221 p Sponsored in part by Sandia National Lab., and by AF
(UTIAS-292; ISSN-0082-5255) Avail: NTIS HC A10/MF A01

Two aspects of plasma channel formation based on laser resonance saturation are examined. The influence of molecular nitrogen and attenuation of the laser pulse on the ionization are considered separately. The nitrogen molecules are shown to primarily cool the free electrons through vibrational excitation and to increase the rate of collisional quenching of the laser pumped resonance state population. A simplified 5-level model for sodium atoms was also developed for analyzing the laser ionization based on resonance saturation-LIBORS process. Results from this simplified model are found to be in excellent agreement with the more detailed 20-level model, and this model enables the attenuation of the laser pulse to be calculated as it creates ionization along its path. A comparison of the transmitted laser energy predicted by this model and that observed in a series of experiments is found to be quite good. The investigation provides further understanding and insights into the ionization of alkali vapors by resonant (or near resonant) laser irradiation and confirms the major role played by electron superelastic collisions. Author

NON-MAXWELLIAN FREE-ENERGY GENERATION IN THE MAGNETOTAIL DUE TO CHAOTIC PARTICLE MOTION
J. Chen and P. J. Palmadesso 30 May 1986 15 p
(AD-A168504; NRL-MR-5788) Avail: NTIS HC A02/MF A01 CSCL 04/1

It has previously been shown that the charged-particle motion in a magnetotail-like magnetic field is generally non-integrable and that the particle orbits can be classified into three distinct types; the bounded integrable orbits, unbounded stochastic orbits and unbounded transient orbits. The three distinct types of orbits occupy disjoint regions of the phase space. As a result, the different regions of the phase space retain the memory of the existing distribution function for different lengths of time. The concept of differential memory in single-particle distributions is discussed. Physical implications for the dynamical properties of the magnetotail plasmas, and the possible generation of non-Maxwellian features in the distribution function are discussed. GRA

MILLIMETER WAVE GENERATION BY RELATIVISTIC ELECTRON BEAMS Final Report, 1 Oct. 1982 - 30 Sep. 1985
Spencer S. Kuo, Bernard R. Cheo, K. K. Tiong, and M. H. Whang 1 Nov. 1985 47 p
(Grant AF-AFOSR-0001-83)
(AD-A168624; POLY-85-011; AFOSR-86-0306TR) Avail: NTIS HC A03/MF A01 CSCL 20/9

The classical technique of transformation and characteristics is employed to analyze the problem of strong turbulence in unmagnetized plasmas. The effects of resonance broadening and perturbation expansion are treated simultaneously without time securities. The renormalization procedure is used in the transformed Vlasov equation to analyze the turbulence and to derive explicitly a diffusion equation. Analyses are extended to inhomogeneous plasma and the relationship between the transformation and ponderomotive force is obtained. GRA

RADIAL FOKKER-PLANCK MODEL FOR PLASMAS CONFINED BY MAGNETIC MIRROR FIELDS
A. H. Futch May 1986 86 p
(Contract W-7405-eng-48)
(DE86-012225; UCID-20781) Avail: NTIS HC A05/MF A01

A time-dependent computer model has been developed for the spatially dependent distribution function f(r,v,t). An orbit averaged Fokker-Planck equation treats Coulomb collisions and various atomic physics processes. The motivation for the present code is to provide an accurate treatment of gyro-radius effects and realistic beam geometries which have been neglected in previous Fokker-Planck codes. Finite width beams may be offset from the plasma center to determine beam injection for build-up studies. The inclusion of a finite gyro-radius is essential for studying radial transport due to both quasilinear fluctuations and charge exchange collisions. Charge exchange with energetic beam atoms and plasma erosion due to charge-exchange collisions with thermal gas are both included. Quasilinear diffusion terms include the effects of turbulent diffusion in the model. The model has been

used to study particle and energy confinement times in the 2XIIB experiment and in the mirror plug of the TMX experiment. Calculated values of T(sub e) decrease from classical Fokker-Planck values (1000 eV for 2XIIB) to the 50 eV to 200 eV range observed in 2XIIB and TMX experiments. Radial density profiles and magnetic field agree with experiments. DOE

MAGNETOHYDRODYNAMIC SHOCKS IN MOLECULAR CLOUDS Ph.D. Thesis
David Fisher Chernoff 1985 471 p
Avail: Univ. Microfilms Order No. DA8609976

Part one develops the mathematical and physical theory of one dimensional, time-independent subalfvenic flow in partially ionized gas with magnetic fields, for application to shocks in molecular clouds. Unlike normal gas dynamic shocks, the neutral flow may be continuous and cool if the gas radiates efficiently and does not self-ionize. Analytic solutions are given in the limit that the neutral gas is either adiabatic or isothermal (cold). Numerical techniques are developed and applied to find the neutral flow under general circumstances. Part two extends the theory and results of part one in three ways: (1) to faster, superalfvenic flows, (2) to complex gases containing heavy charged particles (grains) in addition to ions, electrons and neutrals, and (3) to the entire range in (Omega tau), the ratio of charged particle damping time to gyroperiod, expected in gas flows in molecular clouds. Dissert. Abstr.

SIMULATION STUDIES FOR SURFACES AND MATERIALS STRENGTH Semiannual Report, 1 May - 31 Oct. 1986
Timur Halicioglu Oct. 1986 6 p
(Contract NCC2-297)
(NASA-CR-177046; NAS 1.26:177046) Avail: NTIS HC A02/MF A01 CSCL 20L

During this reporting period three investigations were carried out. The first area of research concerned the analysis of the structure-energy relationship in small clusters. This study is very closely related to the improvement of the potential energy functions which are suitable and simple enough to be used in atomistic simulation studies. Parameters obtained from ab initio calculations for dimers and trimers of Al were used to estimate energetics and global minimum energy structures of clusters continuing up to 15 Al atoms. The second research topic addressed modeling of the collision process for atoms impinging on surfaces. In this simulation study qualitative aspects of the O atom collision with a graphite surface were analyzed. Four different O/graphite systems were considered and the aftermath of the impact was analyzed. The final area of investigation was related to the simulation of thin amorphous Si films on crystalline Si substrates. Parameters obtained in an earlier study were used to model an exposed amorphous Si surface and an a-Si/c-Si interface. Structural details for various film thicknesses were investigated at an atomistic level. M.G.

DENSITY OF STATES DUE TO PAIRING OF IMPURITIES IN SEMICONDUCTOR SYSTEMS
E. A. deAndradaeSilva, I. C. daCunhaLima, and A. FerreiradaSilva Oct. 1986 18 p Submitted for publication
(INPE-4009-PRE/1001) Avail: NTIS HC A02/MF A01

The pair formation of hydrogen - like impurities in 3-D and 2-D systems is studied. The density of states is obtained for the ground state of the H2 - like molecule and H2+ - like ion for concentrations realizable in doped semiconductors and MOS structures. The joint density of states for the transition H2 yields H2+ is also obtained. The calculated bandwidth shows that pair formation is relevant in those systems. Author

ELECTRON TUNNELING MICROSCOPY Final Report, 1 Sep. 1984 - 30 Nov. 1985
John D. Baldeschwieler 20 May 1986 4 p
(Contract N00014-89-K-0638)
(AD-A168234) Avail: NTIS HC A02/MF A01 CSCL 14/5

Within the past few years a new technique for surface studies has been introduced by researchers at the IBM Research Laboratory in Zurich, Switzerland which is capable of atomic resolution. This method, called Scanning Tunneling Microscopy (STM), involves positioning a probe a few angstroms from the surface of interest using a piezoelectric ceramic. A small potential is applied across the gap and the electron tunneling current is measured. The probing tip is then scanned across the surface in two dimensions also using piezoelecric ceramics while adjusting the distance between the tip and surface to maintain a constant current. In this way the tip is made to follow the contours of the surface. The resolution obtained in this way is about 3A in the surface plane, and 0.1 A normal to the surface. GRA

SYNTHESIS AND CRYSTAL AND MOLECULAR STRUCTURE OF IN(C5Me5)-AN APPARENT OCTAHEDRAL CLUSTER
O. T. Beachley, Jr., Melvyn R. Churchill, James C. Fettinger, J. C. Pazik, and L. Victoriano 29 May 1986 13 p Submitted for publication
(Contract N00014-78-C-0562)
(AD-A166281; TR-15) Avail: NTIS HC A02/MF A01 CSCL 07/4

The new compound In(C5Me5) has been prepared and characterized by an X-ray structural study as an octahedral cluster. This new indium(I) compound is a golden yellow, volatile crystalline

solid at room temperature. An X-ray structural study demonstrates that the compound crystallizes in the rhombohedral space group R3 (C superscript 2 sub 3i; No. 148) with unit cell parameters (hexagonal setting) a=20.182(4), c=13.436(3)angstrom, V-4739(2) angstrom and Z=18. The structure refined to R sub F=3.6% and R sub wF=3.3% for all 1870 unique data. The crystal consists of an octahedral cluster (In(C5Me5)6) with indium atoms on the interior and eta 5 -C5Me5 units on the exterior. All pentamethylcyclopentadienyl rings exhibit eta 5-coordination to indium but the centroid indium vectors do not point toward the center of the hexaindium cluster as in other main-group clusters. DEEP-LEVEL TRANSIENT SPECTROSCOPY STUDIES OF GALLIUM ARSENIDE - ALUMINUM GALLIUM ARSENIDE HETEROSTRUCTURES AND SUPERLATTICES
Paul A. Martin May 1986 82 p
(Contracts N00014-76-C-0806; DAAG29-84-K-0001)
(AD-A168328; UILU-ENG-86-2212) Avail: NTIS HC A05/MF A01 CSCL 20/12

This report presents the results of two projects. First, the feasibility of using deep-level transient spectroscopy (DLTS) to measure conduction band-edge discontinuities in GaAS-AlGaAs quantum-well heterostructures is evaluated theoretically and experimentally. Second, defects in GaAs - AlGaAs superlattices are examined using DLTS. Deep-level transient spectroscopy is reviewed, as are theoretical and experimental attempts to predict and measure band offsets. A theory of electron capture into and emission out of quantum wells in response to pulsed bias is developed. DLTS studies of GaAs AlGaAs quantum-well structures are presented and compared with the results of previous studies of defects in MOCVD GaAs and AlGaAs. Emission of electrons out of the GaAs quantum well is observed, but at emission rates in excess of those predicted by thermionic emission or by phonon assisted tunneling. In the absence of a model for the emission process, meaningful data for band-edge discontinuities cannot be extracted from the measured emission rates. Further characterization of the emission process would be of great value in the development of devices based on heterojunction technology. Data are also presented from a DLTS study of defect states in GaAs - AlGaAs superlattices. Doubling the layer thickness from 50 to 100 A resulted in a dramatic change in the defects observed. This is accounted for by the presence of a conducting miniband in one super-lattice and its absence in the other. GRA

INTERFACIAL PROPERTIES OF GERMANIUM NITRIDE DIELECTRIC LAYERS IN GERMANIUM Final Report, 1 Jul. 1984 - 30 Jun. 1985
L. G. Meiners 1986 9 p
(Contract N00014-84-K-0459)
(AD-A168332) Avail: NTIS HC A02/MF A01 CSCL 20/3

The first year's effort on this project has been primarily devoted to the design and construction of a low-pressure chemical vapor deposition system for growth of the germanium nitride layers. The gas manifold layout is shown schematically, as is the reactor assembly, and the vacuum pumping assembly. The generator-cavity system is capable of delivering 0-600 W of microwave power at 2.45 GHz. The power generating section has been constructed from components contained in a portable home microwave oven and the cavity was assembled from easily machinable pieces. The cw magnetron source was mounted directly on a cylindrical microwave cavity. The plasma was contained in an on-axis 20-mm o.d. quartz tube. Design tradeoffs and operating information are discussed. GRA

RESEARCH ON SEMICONDUCTOR HETEROSTRUCTURES Final Report, Jun. 1977 - 85
Herbert Kroemer May 1986 10 p
(Contract N00014-77-C-0430)
(AD-A168357) Avail: NTIS HC A02/MF A01 CSCL 20/12

A wide diversity of topics related to various new properties of semiconductor heterostructures were investigated, ranging from an intense occupation with the problem of the band lineup at semiconductor heterojunctions, to the problem of the MBE growth of GaAs/Ge alloys and the structure of these alloys, with a variety of topics in between. The development, under this contract, of the C-V profiling technique for the determination of heterojunction band offsets has since then emerged as the most reliable technique of offset determination and which has widely displaced the quantum well absorption technique as the preferred method of offset determination. Below-gap light emission from staggered-lineup heterojunctions has become unusually timely with the discovery that the (Al, Ga)As/GaAs heterosystem is a staggered-lineup system. Several other topics investigated also contributed to an advancement of the understanding of semiconductor heterostructures. GRA

TOPICAL MEETING ON MICROPHYSICS OF SURFACES, BEAMS AND ADSORBATES HELD AT SANTA FE, NEW MEXICO ON 4 - 6 FEBRUARY 1985 Final Technical Digest
Jarus W. Quinn 18 Dec. 1985 123 p Meeting held at Santa Fe, N. Mex., 4-6 Feb. 1985
(Grant AF-AFOSR-0018-85)
(AD-A168618; AFOSR-86-0309TR) Avail: NTIS HC A06/MF A01 CSCL 07/5

The Topical Meeting on Microphysics of Surfaces, Beams, and Adsorbates was organized within the interdisciplinary area of molecule/surface interactions induced, or studied, by laser and ion beam techniques. Especially emphasized was the molecular physics and electromagnetism of beam activated chemical reactions for applications in fabrication of semiconductor devices, in photocatalysis, and in optical recording. Emphasis was on the laser spectroscopy of molecular collision and reaction processes on surfaces, new sensitive or high resolution spectroscopies for studies of adsorbates, and optical methods applied to surface characterization. LSI/VLSI ION IMPLANTED PLANAR GaAs IC PROCESSING Final Report, 1 Jan. 1983 - 31 Mar. 1985
C. G. Kirkpatrick Nov. 1985 55 p
(Contract F49620-83-C-0042; ARPA Order 3384)
(AD-A168786; MRDC41129.12FR; AFOSR-86-0304TR) Avail: NTIS HC A04/MF A01 CSCL 09/1

The scope of this program was two-fold: (1) to complete and stabilize the development of a planar fabrication process for high speed digital integrated circuits on 3-inch GaAs wafers, and (2) to utilize gate arrays up to the 1k equivalent gate level as the demonstration circuits for this process development. In addition to optimizing equipment and handling techniques for 3-inch GaAs wafers, the process development task concentrated on test chip characterizations, threshold voltage uniformity control, and materi-

sis evaluation. Piezoelectrically generated device non-uniformities were a primary consideration during this time. The gate array development involved two masked sets. The first was used to establish process and design criteria for gate arrays, as well as to fabricate a 5 x 5 multiplier. The second mask set was an extension of the previous work, and was used to fabricate gate arrays of the 1k equivalent gate complexity. The Mayo Foundation provided the expertise for auto-routing and personalization techniques.

SURFACE VIBRATIONS AND (2X1) SUPERSTRUCTURES ON FCC(110) METAL SURFACES
Joseph A. Stroscio, M. Persson, and W. Ho Jun. 1986 49 p
(Contracts N00014-82-K-0576; N00014-81-K-0505)
(AD-A168788; TR-22) Avail: NTIS HC A03/MF A01 CSCL 07/4

Electron energy loss spectra are presented for a number of adsorbate overlayers which form (2x1) superstructures on the fcc(110) surface of Nickel and Copper. These include (2x1) structures of H, N2, CO, and O. Lattice dynamical slab calculations are used to analyze the vibrational properties observed in the loss spectra which result from symmetry selection rules for dipole activity of the surface phonons. The calculated spectral densities, together with the symmetry selection rules, are used to analyze proposed models for the adsorbate overlayer structures. GRA

THE DISCRETE SITE STICKY WALL MODEL Interim Technical Report
J. P. Badiali, L. Blum, and M. L. Rosinberg 27 May 1986 13 p
(Contract N00014-81-C-0776)
(AD-A168910; TR-23) Avail: NTIS HC A02/MF A01 CSCL 20/13

The interface between a solid and a liquid is modelled by a flat surface with an array of sticky sites which could be placed on a regular lattice, or also randomly. It is first shown that the thermodynamics and distribution functions can be expressed entirely in terms of the distribution functions of the system without the sticky sites. Furthermore, the problem of the occupation of the sites (equivalent to the adsorption isotherm), is a lattice problem which exhibits phase transitions and critical points. A simple application to the interface between a solid and a fluid of hard spheres is discussed. GRA

INTERFACIAL REACTIONS BETWEEN AMORPHOUS W-S1 THIN FILMS AND POLYCRYSTALLINE OVERLAYERS
R. E. Thomas, J. H. Perepezko, and J. D. Wiley 1986 7 p Presented at the Fall Meeting of the Materials Research Society, Boston, Mass., Dec. 1985 Submitted for publication
(Contract DE-FG02-84ER-45096)
(DE86-008959; CONF-851217-63) Avail: NTIS HC A02/MF A01

Interactions between amorphous metal thin films and either a substrate or an overlayer can limit their effectiveness as diffusion barrier. It was found previously that Au and Al polycrystalline thin films in contact with amorphous W-Si lowers the crystallization temperature of the a-(W-Si) by at least 100 C. In contrast Cu and Mo have no apparent effect on the stability of the amorphous layer. The mechanisms leading to premature crystallization are not well understood. Amorphous W.72Si.28 was deposited by sputtering onto single crystal substrates. Overlayers of Al were then evaporated onto the W-Si. Using Auger electron spectroscopy depth profiling coupled with cross section transmission electron microscopy, interfacial reactions were studied between the amorphous layer and polycrystalline Al. Auger profiling results show that in the case of Al overlayers, W and Si diffuse out of the a-(W-Si) into the Al where WAl12 forms. These results can be explained in the context of three binary diffusion couples, W-Si, W-Al, and Al-Si, and the individual interactions associated with these couples. Author

DENSITY OF STATES AT MID GAP IN HYDROGENATED AMORPHOUS SILICON
E. Yahya and H. R. Shanks 1986 6 p Presented at the 3rd International Symposium on Optical and Optoelectrical Applied Science and Engineering, Innsbruck, Austria, 14 Apr. 1986
(Contract W-7405-eng-82)
(DE86-011403; IS-M-584; CONF-8604210-1) Avail: NTIS HC A02/MF A01

The density of states distributions near mid gap in a series of hydrogenated amorphous silicon films have been determined from space charge limited current measurements. The measurements were made on Au/aSi:H Schottky diode structures prepared by reactive rf sputter deposition. Samples with hydrogen concentrations near 16% as determined from infrared absorption had densities of states of 3 x 10 to the 14th power states/cu cm eV. The experimental results indicate that high quality aSi:H films with low densities of states can be obtained under certain deposition conditions and that the density of states at mid gap is hydrogen concentration dependent with a minimum near 16%. For a given hydrogen concentration, films thicker than 2 micrometers yielded

the lowest density of states consistent with a model in which diffusion currents can be neglected and where surface and interface layers have a higher defect density than the bulk of the film. DOE

TUNNELING IN ONE DIMENSION: GENERAL THEORY, INSTABILITIES, RULES OF CALCULATION, APPLICATIONS
G. Jona-Lasinio, F. Martinelli, and E. Scoppola 2 Sep. 1985 40 p Submitted for publication
(Preprint-475; ETN-86-97910) Avail: NTIS HC A03/MF A01

Techniques used to analyze the semiclassical limit in quantum mechanics are illustrated by one dimensional tunneling problems. A set of rules obeyed by the logarithmic derivative of the ground state wave function which are valid in any situation are presented. Double well problems are discussed. Tunneling through sequences of two types of barriers in situations of increasing complexity is analyzed. Inductive methods to derive the behavior in a long sequence from the analysis of short subsequences are obtained. Results are sufficient to treat physically interesting problems. A hierarchical model where tunneling can be analyzed over all possible scales is treated. ESA

ANALYSIS OF THE LIQUID CRYSTAL LIGHT VALVE USING BI12SIO20 AS THE PHOTOCONDUCTOR
S. S. Makh Nov. 1983 31 p
(LR49625; ETN-86-97950) Avail: NTIS HC A03/MF A01

The liquid crystal light valve (LCLV) using BSO as the photoconductor was analyzed, under ac conditions, using an equivalent electrical circuit. This permits the behavior of the LCLV to be examined as a function of temporal frequency of the driving voltage. Theoretical modulation transfer function curves can be drawn to look at the effects of photoconductor thickness on the device resolution. An analysis carried out by Aubourg et al (1982) who report that a 25V ac voltage is sufficient to switch the liquid crystal was repeated. Similar results are not obtained. ESA

N87-12376# British Aerospace Public Ltd. Co., Bristol (England). Materials Research Dept.
A MODEL FOR THE LIQUID CRYSTAL LIGHT VALVE. PART 1: ANALYSIS OF CHARGE TRAPPING IN THE BSO AND ITS EFFECT ON THE DEVICE RESOLUTION
S. S. Makh Jan. 1984 57 p
(BAe-BT-15603; LR49836; ETN-86-97972) Avail: NTIS HC A04/MF A01

The effect of charge trapping on the resolution of the Pockels readout optical modulator was analyzed according to Owechko and Tanguay (1979 to 1980). The variation of sensitivity and resolution is examined as a function of spatial frequency and charge separation. The model of Owechko and Tanguay is modified to solve the geometry of the liquid crystal light valve using bismuth silicon oxide as the photoconductor. The appropriate differential equations are set up and solved and the variation of sensitivity and resolution is examined as a function of symmetric and asymmetric charge location and spatial frequency. ESA

HEAT CAPACITY AND ENTHALPY OF LIQUIDS: ALKANES
May 1986 46 p Supersedes ESDU-77025
(ESDU-86007; ISBN-0-85679-559-3; ISSN-0141-4062; ISSN-0141-4070) Avail: ESDU

This Data Item ESDU 86007 is an addition to the Physical data, chemical engineering, and Physical data, mechanical engineering Sub-series. The heat capacity and enthalpy data are given for 70 alkanes tabulated at 10 K intervals between the normal melting point and 0.96 critical temperature along the saturation line. The data were obtained by fitting a polynomial equation to experimental data for heat capacity for each compound taken from a wide range of sources in the literature; the constants of the equations were also faired with molecular structure for compounds that were members of the same chemical series. The enthalpy values were obtained by integrating the specific heat capacity polynomial for each compound. The coefficients of the equations are tabulated together with values of critical temperature and normal melting point for each compound. An estimation of the accuracy of the predictions is included. ON THE ELEMENTARY THEOREMS OF DECISION THEORY
Narassinga R. Chaganty Jun. 1986 20 p
(Contract DAAL03-86-K-0094)
(AD-A170285; FSU-STATISTICS-M732; TR-D-91-ARO; ARO-23699.1-MA) Avail: NTIS HC A02/MF A01 CSCL 12/1

This document considers a statistical decision problem in which nature has a finite number of states. The elementary theorems of decision theory, namely the Minimax theorem, the Complete class room theorem, and theorems on the structure of admissible rules, are proved in most texts under the assumptions that the risk set is closed from below and bounded from below. The condition that the risk set is bounded from below is sufficient for the existence of the lower boundary points; however, that it is not necessary can be seen from simple examples. The purpose of this paper is to extend the elementary theorems of decision theory to include the case in which the risk set is not bounded from below and the set of lower boundary points is nonempty. The author also shows that if the risk set is bounded from above then it is necessary for the risk set to be bounded from below for the set of lower boundary points to be nonempty. Examples are presented to illustrate this theorems. Author (GRA)

The Jet Propulsion Laboratory (JPL) bibliography 39-26 describes and indexes by primary author the externally distributed technical reporting, released during calendar year 1984, that resulted from scientific and engineering work performed, or managed, by the Jet Propulsion Laboratory. Three classes of publications are included: (1) JPL Publications (82-, 83-, 84-series, etc.), in which the information is complete for a specific accomplishment; (2) articles from the quarterly Telecommunications and Data Acquisition (TDA) Program Report (42-series); and (3) articles published in the open literature. USING OPTICAL DISK AS THE STORAGE MEDIA DEVICE FOR THE MASTER PERSONNEL FILES
Terry L. Brooks Apr. 1986 38 p
(AD-A168390; ACSC-86-0350) Avail: NTIS HC A03/MF A01 CSCL 09/2

Growing demands on the HQ Air Force Military Personnel Center (AFMPC) system warranted research on optical disk computer technology to determine its potential to enhance the personnel system's capability, and to complement the Honeywell systems in this already demanding environment. This paper reviews the current state-of-the-art and recommends that HQ AFMPC budget for the acquisition of an optical disk prototype system to further explore the advantages of this type of storage media device to the HQ AFMPC processing environment. This storage media will serve as a supplement to the current Honeywell system. Other suggested Optical disk applications for HQ AFMPC to pursue include: possible replacement for the numerous paper records that are placed on microfilm at HQ AFMPC. This area requires a labor intensive environment for transferring records from paper to microfiche. The use of the optical disk system could reduce or possibly eliminate the manpower requirement for this paper to microfilm transition. Reduction in the space requirements of the storage media computer equipment at HQ AFMPC. This could result in a possible elimination of the bulky offline storage

systems (magnetic tape) and a reduction in the manpower requirement. GRA

A USER'S GUIDE TO THE SOCIOECONOMIC ENVIRONMENTAL DEMOGRAPHIC INFORMATION SYSTEM (SEEDIS)
Fredic C. Gey Jan. 1986 130 p
(AD-A168917; IWR-86-UM-1) Avail: NTIS HC A07/MF A01 CSCL 05/3

SEEDIS, the Lawrence Berkeley Laboratory's Socio-Economic Environmental-Demographic Information system, is an integrated information system for retrieving, analyzing, and displaying selected portions of large data bases. These include a wide variety of geographically linked data on the United States' population, economy, agriculture, employment, mortality, air quality, and energy production and use. For Corps of Engineers' planners, SEEDIS is primarily useful for obtaining demographic and socioeconomic data for economic base studies, social profiles and other plan formulation and evaluation tasks. Using SEEDIS Corps analysts can: (1) retrieve over 50,000 pieces of information at county levels of detail and over 1,000 pieces of data for sub-county levels of geography; (2) transform SEEDIS data into formats useable by statistical analysis programs (SPSS and SAS) as well as by popular microcomputer Spreadsheet programs (LOTUS 1-2-3); and (3) download SEEDIS files or transformed files to microcomputer using communications software. This manual guides a new SEEDIS user on a step-by-step tour through the elements of SEEDIS. This journey is illustrated by examples screens, each of which builds upon previous ones. The examples focus on a three county geographic area (the Topeka Kansas SMSA) and on data from the 1947 to 1977 County Data Book and 1980 Census summary tape files. GRA

ARMY TECHNOLOGY DEVELOPMENT. IBIS QUERY. SOFTWARE TO SUPPORT THE IMAGE BASED INFORMATION SYSTEM (IBIS) EXPANSION FOR MAPPING, CHARTING AND GEODESY Final Report
Steven Z. Friedman, Richard E. Walker, and Robert B. Aitken Jun. 1986 126 p
(AD-A169609; JPL-D-2802; ETL-0422) Avail: NTIS HC A07/MF A01 CSCL 09/2

The Image Based Information System (IBIS) has been under development at the Jet Propulsion Laboratory (JPL) since 1975. It is a collection of more than 90 programs that enable processing of image, graphical, tabular data for spatial analysis. IBIS can be utilized to create comprehensive geographic data bases. From these data, an analyst can study various attributes describing characteristics of a given study area. Even complex combinations of disparate data types can be synthesized to obtain a new perspective on spatial phenomena. In 1984, new query software was developed enabling direct Boolean queries of IBIS data bases through the submission of easily understood expressions. An improved syntax methodology, a data dictionary, and display software simplified the analysts' tasks associated with building, executing, and subsequently displaying the results of a query. The primary purpose of this report is to describe the features and capabilities of the new query software. A secondary purpose of this report is to compare this new query software to the query software developed previously (Friedman, 1982). With respect to this topic, the relative merits and drawbacks of both approaches are covered. GRA

PSYCHOLOGICAL CONCEPTS IN A PARALLEL SYSTEM
James A. Anderson and Gregory L. Murphy 27 Jun. 1986 50 p Submitted for publication
(Contract N00014-81-K-0136; Grants NSF BNS-82-14728; NSF BNS-83-15145)
(AD-A169615) Avail: NTIS HC A03/MF A01 CSCL 05/10

Many parallel information processing systems have been proposed which are loosely based on the architecture of the nervous system. Many of the testable predictions of these systems fall in the realm of cognitive science since they perform some computations well and some poorly and have pronounced psychologies. In such system, simple elements are connected to each other; the elements act like neurons in that they sum excitation and inhibition from other elements. Information is represented as large state vectors of element activities, and it can be shown that simple synaptic learning rules can serve to associate arbitrary state vectors using a matrix of connections. One version of this class of models has been shown in the past to form concepts and to perform classification computations. This paper discusses the general importance and structure of psychological concepts and describes three simulations of a simple neural model that attempts to reproduce a few of the important properties of human concept formation. PDES LOGICAL LAYER INITIATION TASKS Final Report
J. C. Kelly 28 Apr. 1986 684 p
(Contract DE-AC04-76DP-00789)
(DE86-012289; SAND-86-1048C) Avail: NTIS HC A99/MF A01

PDES stands for Product Data Exchange Standard. A long-term project, chaired by Kalman Brauner of the Boeing Company, existed within the IGES Committee to develop PDES. This project had two primary objectives: (1) to develop an exchange standard for product data in support of industrial automation, and (2) to represent the US position in the International Standards Organization (ISO) arena relative to the development of a single worldwide standard for the exchange of product data. Product Data is taken to be more general than product definition data. It includes data relevant to the entire life cycle of a product; manufacturing, quality assurance, testing, and support. Development of an exchange standard for product data involved settling on a set of logical structures to contain the product data information, and also settling on the manner in which these structures will be implemented in computer form. DOE

COMPUTING COVERS FOR EMBEDDED FUNCTIONAL DEPENDENCIES
Georg Gottlob 1986 33 p
(Rept-86-006; ETN-86-97940) Avail: NTIS HC A03/MF A01

A reduction by resolution algorithm for computing covers for the functional dependencies embedded in a subset of a given relation schema is presented. Although the problem of computing covers for embedded dependencies is inherently exponential, the algorithm behaves polynomially for several classes of inputs. It can be used for the solution of related problems in the theory of data base design, such as deciding whether a given data base scheme is in Boyce-Codd Normal Form or decomposing a scheme into Boyce-Codd Normal Form. ESA

ESTIMATING BUCKET ACCESSES: A PRACTICAL APPROACH
Alle IJbema and Henk Blanken Jul. 1985 32 p
(INF-85-18; ETN-86-98168) Avail: NTIS HC A03/MF A01

The data base query optimization problem of estimating the number of bucket accesses, when drawing randomly and without replacement k balls from m buckets containing together n balls is discussed. The expected number of buckets from which at least

one ball has been drawn depends strongly on the distribution of the balls over the buckets. A set of ball distributions covering many practical situations is defined. For a member of this set the expected number of upper and lower bound for this number can be given. A very fast method to approximate this expected number for an arbitrary member of the set is given. ESA

LOGICAL TREATMENT OF KNOWLEDGE SEMANTIC INTEGRITY AND ORGANIZATION IN DATA BASE MANAGEMENT SYSTEMS Ph.D. Thesis [TRAITEMENT LOGIQUE DE L'INTEGRETE ET DE L'ORGANISATION SEMANTIQUE DES CONNAISSANCES DANS LES SYSTEMES DE GESTION DE BASES DE DONNEES]
Judith Olivares 1986 164 p In FRENCH Sponsored by Fondation Venezuelienne Gran Mariscal d'Ayacucho
(ETN-86-98398) Avail: NTIS HC A08/MF A01

Data semantic integrity in data base management systems was studied. The organization of knowledge such as general laws of an environmental reality is analyzed using a method which allows their coherent definition. The proposed ideas are formalized using first order predicate calculus. Prolog language is used to implement these ideas. It is shown that this logics approach is applicable to obtain a uniform treatment of data semantic integrity, operation on open or closed data universes, and the treatment of implicit data. ESA

EXTENDING A RELATIONAL INTERFACE WITH RECURSION
Peter M. G. Apers, Maurice A. W. Houtsma, and Frank Brandse May 1986 26 p
(INF-86-10; ISBN-90-365-0040-0; ETN-86-98518) Avail: NTIS HC A03/MF A01

The mu-calculus is used to extend a relational interface with recursion. With a mu-calculus, regular and non regular recursion can be expressed uniformly. Transition graphs are used to graphically represent a regular recursive query. Algorithms to process the transitive closure and regular recursive queries are proposed. The latter is based on transforming transition graphs. The minimization objectives are the number of joins and unions. ESA

PUBLIC PERSPECTIVES ON GOVERNMENT INFORMATION TECHNOLOGY: A REVIEW OF SURVEY RESEARCH ON PRIVACY, CIVIL LIBERTIES AND THE DEMOCRATIC PROCESS
W. H. Dutton and R. G. Meadow Jun. 1985 91 p Sponsored in part by Office of Technology Assessment
(PB86-218419) Avail: NTIS HC A05/MF A01 CSCL 05B

The primary purpose is to review survey research on public attitudes toward governmental uses of new communication, computing, and information technologies. Particular attention is paid to the implications of governmental information technologies for civil liberties and democratic processes. A secondary purpose is to identify generalizations about the public's views toward these issues that tend to be supported or refuted across surveys. A third and final purpose is to speculate on possible public reactions to governmental uses of emerging technologies which have implications for privacy or other civil liberties. GRA

VARIABILITY STUDIES OF 3C 371 Final Report, 1 Apr. 1985 - 30 Sep. 1986
Diana M. Worrall Oct. 1986 4 p
(Contract NAG8-523)
(NASA-CR-179772; NAS 1.26:179772) Avail: NTIS HC A02/MF A01 CSCL 03A
The compact extragalactic radio source, 3C 371, was observed with the X-ray detectors of the EXOSAT satellite for 19.5 hours in 2 observing periods separated by 18 days. This resulted in the discovery of X-ray variability of the source on time scales between 8 hours and about 25 minutes and the confirmation of earlier reports of variability on longer time scales. The short time scale variability agrees remarkably well with earlier predictions based on fitting multifrequency data from the source to a relativistically beamed inhomogeneous synchrotron self-Compton (SSC) jet model. This SSC model is frequently applied to BL Lac objects and related sources, such as 3C 371. However, the number of free parameters in model fits tends to be large, and so independent support such as from this work is important. The X-ray spectral results for 3C 371 also may provide qualitative support for the SSC model in that the spectrum probably consists of two components, with the steeper one at low photon energies. In terms of the model, the low-energy spectrum would be dominated by synchrotron emission extending down to radio energies, whereas the higher energy X-rays would be dominated by Compton radiation. M.G.

THE ARECIBO S-BAND RADAR PROGRAM c32
Donald B. Campbell *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 3-4 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 17I
Reduction to images of the 1983 monostatic Venus mapping data was completed. Analysis of the images, including detailed comparisons with Pioneer Venus data and Soviet Venera 15/16 images, continued. Feature locations in Arecibo Venus radar images produced between 1975 and 1983 were used to make a new determination of the rotation vector. This result is of general interest but was also required for planning and cartographic purposes for the Magellan mission. A new set of observations of Venus were made in March/April 1985, aimed at imaging low northern and high southern latitudes, including the south polar region, at 1 to 2km resolution. A limited number of ranging observations were made to Mercury and Venus. Ten asteroids were detected increasing the number studied with the Arecibo system to almost 40. A system to allow high time resolution, as well as high Doppler frequency resolution, studies of small asteroids or comets which make close approaches to the Earth was implemented. A radar

detection of Halley's Comet was obtained when it approached to within 0.62 AU of the Earth in November/December of last year. It is still uncertain whether the echo is a reflection from the nucleus or from a cloud of cm-sized particles in the vicinity of the nucleus. E.R.

ADVANCED INFRARED ASTRONOMY
Michael J. Mumma, Drake Deming, Fred Espenak, and Theodor Kostiuk *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 11-13 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

The CO2 laser heterodyne spectrometer was used at the 3-m IRTF on Mauna Kea to make measurements of Mars during the 1984 opposition. Analysis of the observations of the mesospheric non-thermal emission demonstrated the existence of a warming of the Mars polar mesosphere, similar to the seasonal effects which are well known to occur at the Earth's mesopause. A search for CO2 and NH3 on Comet Halley was done with the new Kitt Peak system as well as with the IRTF heterodyne system. A Lamb-dip absorption cell was designed and constructed. Its use will allow extreme frequency stabilization of the laser local oscillator, which will greatly facilitate measurements of winds and dynamical phenomena. The Lamb-dip cell was used at Kitt Peak to study zonal and meridional winds in the atmosphere of Venus. Water vapor was detected in Comet Halley using Fourier transform spectrometer. The 2.65 micrometer upsilon sub 3 band was seen in emission, confirming non-thermal-equilibrium excitation models for comets. A study was made of the variability of Jovian ethane emission. The average volume mixing ratio of ethane in the Jovian stratosphere was found to be 3x10 to the -6 power, with the greatest variability seen in the auroral regions. E.R.

N87-12412*# New Mexico State Univ., Las Cruces. Dept. of Astronomy.
LONG-TERM CHANGES IN REFLECTIVITY AND LARGER SCALE MOTIONS IN THE ATMOSPHERES OF JUPITER AND SATURN **c91**
Reta F. Beebe *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 17-18 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03B

A multi-color, broad-band photographic program for monitoring atmospheric variability of Jupiter and Saturn with the 61-cm, f/75 telescope was continued. The archivial product consists of approximately 20 sequential images on 3 1/4 x 4 1/4 glass plates with a plate scale of 4.53 arc sec/mm. An eleven-step sensitometric wedge, recorded times of acquisition, and fiducial marks which determine the orientation of the plate, are recorded on each individual plate. This allows accurate positional measurements, as well as detailed relative surface brightness determinations. Detailed measurements of the Red Spot are being utilized in a study of zonal velocity variation and the ability to predict the longitude of the Red Spot during the Galileo mission. An ongoing 5-color series of Saturn has been maintained to map the seasonal changes in the belt-zone reflectivity. Digitization of a series of blue images containing the Red Spot and a series of red and blue images excluding the Red Spot are being processed and reduced to normalized surface brightness maps. This data is being utilized to map time-dependent brightness variations of selected features, belts, and ones. E.R.

SEARCH FOR VOLATILES IN THE SURFACE OF ICY SATELLITES **c91**
R. H. Brown *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 20 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03B

It is proposed to measure the reflectance spectra of the icy satellites of Jupiter, Saturn and Uranus in the spectral region 1.8 to 2.4 micrometers. These observations use the new Cooled Grating Array Spectrometer using a 32-element InSb photodiode array detector and produce spectra of higher resolution and precision than any data yet obtained; the ultimate scientific objective is to search for the signatures of methane clathrate, ammonium hydroxide or carbon monoxide clathrate (compounds predicted to exist on icy surfaces in the outer solar system by several theories of formation of these bodies) in the region of the spectrum where water ice has a relative maximum in reflectance. At the very least, these data will allow upper limits to be placed on the amount of these chemical species that can be present. The specific targets is Europa, Ganymede, Enceladus, Ariel and Titania, bodies that have the highest probability of having some or all of these volatiles on their surface according to current formation models. E.R.

THEORETICAL AND OBSERVATIONAL PLANETARY PHYSICS c91
John Caldwell *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 21-22 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03B

This program supports NASA's deep space exploration missions, particularly those to the outer Solar System, and also NASA's Earth-orbital astronomy missions, using ground-based observations, primarily with the NASA IRTF at Mauna Kea, Hawaii, and also with such instruments as the Kitt Peak 4 meter Mayall telescope and the NRAO VLA facility in Socorro, New Mexico. An important component of the program is the physical interpretation of the observations. There were two major scientific discoveries resulting from 8 micrometer observations of Jupiter. The first is that at that wavelength there are two spots, one near each magnetic pole, which are typically the brightest and therefore warmest places on the planet. The effect is clearly due to precipitating high energy magnetospheric particles. A second ground-based discovery is that in 1985, Jupiter exhibited low latitude (+ or - 18 deg.) stratospheric wave structure. E.R.

Ring orbit studies for Uranus have been particularly fruitful because of the ability, through occultations, to obtain data of high spatial resolution at the rate of 1 to 2 times per year. The occultation program at M.I.T. involves: (1) identifying the scientific questions that can be answered by occultation events, (2) predicting the zone of visibility for the useful events, (3) maintaining and improving a set of portable high-speed photometric systems, (4) obtaining the observations, and (5) reducing the data and interpreting the results. Two stellar occultations by Uranus occurred in May 1985, and were observed with a network of large telescopes that encompassed the Northern and Southern Hemispheres. Portable quartz-oscillator time standards were used at all observatories, and were calibrated before and after each event. Observations obtained form Cerro Tololo and McDonald Observatories of the 4 May and 24 May 1985 occultations by the Uranian rings clearly show a companion to the delta ring on both the immersion and emersion traces. The occultation by Ceres that occurred on 12 November 1984 was observed. Preliminary results give a mean diameter of 933 + or - 10 km, which implies a geometric albedo, Pv = 0.07 + or - 0.01 and a density 2.7 + or - 0.3 gm cu/cm. Hence Ceres is likely composed of silicate material throughout. E.R.

A very extensive Io sodium imaging program beginning with the first images of the cloud and culminating in comprehensive characterization of the cloud's appearance and behavior as a function of both time and Io's orbital position now forms the basis for a collaborative modeling analysis and a continued observational study with emphasis on understanding how the cloud's behavior is diagnostic of spatial and temporal variations in the physical conditions of the inner Jovian magnetosphere. The sodium cloud was found to have a variety of systematic variations, a pronounced east-west orbital asymmetry, and temporal changes which could be diagnostic of time changes in both Io and its plasma environment. New comet imaging programs initiated at the 3.6-meter Canada-France-Hawaii Telescope draw upon both ultra high time resolution and high spatial resolution imaging capabilities. Seven observing runs between Dec. 1984 and May 1986 were devoted to observing Halley, Giacobini-Zinner, and several other comets. Among these observations were the first images of Halley through IHW filters, and images of Giacobini-Zinner during the ICE encounter which have been directly correlated with ICE magnetic field measurements. Diffraction-limited telescopic observations were obtained of solar system objects and a program of research into Uranus, Neptune, Pluto and the asteroids based upon the data obtained was persued. Two camera systems appropriate for this work were developed. Most importantly, the PAPA photon address camera was developed and proven. Algorithms were developed for both phase and amplitude recovery and were validated on theoretical and laboratory data and to a limited extent on telescopic data. A laboratory simulator was constructed that was used for development but is also available for controlled investigation of image reconstruction. During 1985 two successful expeditions were made to Hawaii and Cerro Tololo and a large body of data on Pluto, Uranus, Neptune and two asteroids are on tape. E.R.

RESEARCH IN PLANETARY ASTRONOMY AND OPERATION OF THE 2.2-METER TELESCOPE
David N. B. Hall, Dale P. Cruikshank, David Morrison, and William M. Sinton *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 28-31 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

The turn-around in the secular change in brightness of Pluto was detected, the planet is now beginning to brighten. The spectral signature was found of an ammonia bearing compound in the surface ices of Europa. Specific Io volcanic hotspots were detected from infrared photometry of the mutual events of the Jovian satellites. The polarized emission from the volcanic hotspots on Io was discovered and the locations of those hotspots were determined. The orbit of Charon was refined from speckle observations of the Pluto-Charon system. The spectral properties of liquid nitrogen-methane mixtures with reference to the infrared spectrum of Triton were studied. Major progress was made in modeling asteroid lightcurves from a modern theory of photometric properties of the asteroid surfaces. Several additional olivine-rich asteroids from near-infrared spectrophotometry were discovered. Important photometric, spectroscopic, narrow-band imaging data on Comet P/Halley was acquired, along with Schmidt photographs of Comet P/Halley and its tail. E.R.

The interior structure of the Jovian planets was studied by means of observational data obtained by ground-based astronomy. Recent work was oriented toward a determination of oblateness from occultation measurements of the shape of planetary atmospheres. This provides a determination of the degree of central condensation of the planet, which is then compared with interior models and theoretical equations of state. As a serendipitous result of the attempts to measure the oblateness of Neptune, a partial Neptune ring (or arc) was discovered following an occultation observation on July 22, 1984. During 1985, older observations were reexamined to determine whether Neptune

arcs had been detected (but not identified) during previous occultations. It appears that Neptunian arcs may locally imitate Uranian rings, with an 1981 event resembling Uranus' epsilon ring, while an 1984 event was more similar to the thinner Uranian rings such as the alpha ring. E.R.

Telescopic observations were made of gases and plasmas in the Jupiter system, and related phenomena such as the recently-discovered sodium atmosphere of Mercury. Sodium absorption in Io's atmosphere was observed to distances as large as 5 Io radii during the mutual-eclipse season of the Jovian satellites. Analysis of Jovian disk spectra has proceeded, as planned, from an emphasis on the H2 ortho-para ratio to analysis of methane absorptions and determination of cloud structure. Several 2-channel photometers were constructed in 1978 for the Uranus event at which the rings were discovered and a smaller, single-channel unit was built more recently. Although the photometers themselves are still fully usable, the data-acquisition systems have major deficiencies. E.R.

PLANETARY INFRARED ASTRONOMY USING A CRYOGENIC POSTDISPERSER ON FOURIER TRANSFORM SPECTROMETERS
Donald E. Jennings, Virgil G. Kunde, Rudolf A. Hanel, William C. Maguire, and Gerald M. Lamb *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 36-37 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03B

High resolution infrared spectra of planets from ground-based observatories were analyzed and instrumentation to improve sensitivity was developed. A cryogenic postdisperser (a narrow bandpass spectral filter) for use with Fourier transform spectrometers (FTS's) at facility observatories was constructed. This instrument has improved the sensitivity of FTS observations at 8 to 20 microns by about an order of magnitude. Spectra of Jupiter, Saturn and Comet Halley were obtained using the postdisperser with FTS facilities at the Kitt Peak 4-meter and McMath telescopes. Spectral resolution as high as 0.01/cm was achieved. E.R.

The origin of carbon monoxide has been a puzzle for some time, and it has become apparent that CO serves as a tracer of disequilibrium processes in the Jovian atmosphere. High resolution spectra with a Fabry-Perot spectrometer was obtained. From a detailed synthetic spectral analysis of the CO line profiles, it was established that the CO is located in the troposphere of Jupiter. It must therefore be a product of convection upward from hotter levels in the deep atmosphere, and is not a product of infall of material from above the stratosphere. Six lines of CO in Saturn was detected, a surprising result because disequilibrium models predicted that the CO mixing ratio would be too low to be observable if upward convection is the dominant mechanism. Therefore several possibilities for the origin of the CO now exist, none completely satisfactory at this time. E.R.

The Voyager data in a newly produced noise-reduced and recalibrated format has been received. New color spectrograms were developed on high resolution color terminals which display this data. The production of these new spectrograms utilizing the new format data is quite important, because it eliminates a serious problem of noise contamination and miscalibration in the old data set. In addition, a new Jovian plasma model was introduced, which includes the Io torus and accounts for 7 ionic species. The new plasma model is important in the ray tracing of hectometric (HOM) and kilometric (KOM) radiation which may be influenced by the Io torus. E.R.

The millimeter wavelength 3-element array at OVRO was used to observe Halley's comet in carbon monoxide (negative result) and to set an upper limit from continuum flux of 15 km on the size of the nucleus, assumed to be a black body. The Saturn system was observed with the array and ring brightness temperatures at a wavelength of 2.7 mm were obtained. A B-ring temperature of 30 K was compared to the results at lambda = 2 cm of about 7 K indicates the measurement of true emission from the Ring particles at mm-wavelengths. Brightness temperatures of Titan, Neptune, Uranus, Io, Europa, Ganymede, and Callisto were made, all tied to Mars. Accurate microwave spectra of all these objects from 3 mm to 6 cm were obtained. E.R.

INFRARED OBSERVATIONS OF PLANETARY ATMOSPHERES
Glenn S. Orton, Kevin H. Baines, and Jay T. Bergstralh *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 49-50 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

Infrared data was obtained on planetary atmospheres which provides critical information on atmospheric structure, composition, and cloud properties in support of planetary missions such as Voyager and Galileo. Mapping of Jupiter and Saturn in thermal and reflected solar radiation is a high-priority monitoring and exploratory activity. Some of these images of Jupiter are shown. Radiation at 17.8 micrometer probes the upper tropospheric temperature structure where spatial structure bears a strong resemblance to visible and near-infrared reflected sunlight such as at 2.0 micrometer. At 7.8 micrometer, stratospheric temperatures appear to have a three-banded structure, enhancements near the magnetic poles and occasional transient features such as the equatorial filament near the right limb. Clouds or hazes are observed high in the stratosphere looking at wavelengths such as 2.2 micrometer, where gaseous opacity is very strong. Other maps examine cloud properties from thermal radiation not strongly influenced by gaseous opacity and the distribution of condensable gases, such as ammonia. Millimeter and submillimeter filtered radiometric observations were made of Jupiter, Uranus and Neptune via collaborative work. Radiometric observations of Uranus and Neptune at 21 and 32 micrometer were acquired and analyzed as well as grating array spectra in the ranges of 8 to 14 micrometer, 16 to 23 micrometer, and 18 to 32 micrometer. These showed evidence for C2H2 in the stratosphere of Uranus and C2H4 in the stratosphere of Neptune. E.R.

SPECTROSCOPIC OBSERVATIONS OF THE PLANETS
Tobias Owen *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 51-52 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

The first phase of a program to determine D/H in the atmospheres of all of the major planets and Titan was completed. D/H on Titan and Uranus is significantly higher than on Jupiter and Saturn. Titan has the highest value, consistent with the possibility for hydrogen escape. These measurements were all made in terms of CH3D/CH4. They suggest that at least two reservoirs for deuterium exist in the outer solar system - a large one in hydrogen and a much smaller one in hydrogen-containing compounds that have not isotopically equilibrated with the hydrogen. This result also demonstrates that a large fraction of the carbon in the outer solar nebula was in the form of methane and it supports the nucleation model for the formation of the outer planets. Other studies included an investigation of the phosphine abundance over the Great Red Spot (GRS) of Jupiter, pre-Voyager determination of the amount of acetylene on Uranus, and the carbon isotope ratio in Halley's Comet. UV spectra of the GRS obtained with the IUE show no evidence of the enhancement of phosphine that would be expected if the red color of this object is caused by P4. E.R.

GROUND-BASED OBSERVATIONS OF THE JUPITER PLASMA TORUS
Frank Scherb and Fred L. Roesler *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 53-54 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

The intensity variation of (SIII) 9531 A emission from the hot plasma torus of Jupiter was measured using a scanning Fabry-Perot spectrometer. During the observational period, which covered 43 rotations of Jupiter, the (SIII) intensities showed a periodic variation consistent with a zone of enhanced emission approximately 90 deg in longitude, rotating with a period of 10.2 hours, or 2.8% longer than Jupiter's rotational period. Dessler developed a theoretical model of account for Jovian magnetospheric phenomena that differ in repetition period by 3%. In his model, periodic modulation of magnetospheric phenomena is controlled in part by the spin period of magnetic features below the surface of the planet. The differing observed periods are then due to differential rotation of the subsurface magnetic features at different latitudes. A consequence that follows from this concept of differential rotation of the internal planetary magnetic field is that not all the apparent subcorotational plasma flow in the torus is caused by plasma mass loading, as described by Hill and his associates. As a result, the mass loading required to produce the residual subcorotational flow is less than previously estimated. E.R.

A CONTINUED PROGRAM OF PLANETARY STUDY AT THE UNIVERSITY OF TEXAS MCDONALD OBSERVATORY
Harlan J. Smith, Edwin S. Barker, William D. Cochran, and Laurence M. Trafton *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 55-56 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

The beginning of eclipses of the Pluto-Charon system was detected. The onset of coma formation of P/Halley at 5.4 au was detected and evidence of sublimation at 4.8 au when CN emission was detected. Extensive spatial maps of the gas in the comae of comets Halley and Giacobini-Zinner were obtained in fall 1985. Halley was time variable, and Giacobini-Zinner was depleted in C2 and C3 relative to CN. Comet Kopff was shown to have a pre-perihelion brightness maximum of its gas, consistent with mantle development if the comet is a high obliquity object. New Haser model scale lengths for CN, C3, and C2 were determined using results from the Faint Comet Survey. Spectra of 12 asteroids in unusual orbits showed no evidence of any comet-like emission features. In particular, 3200 Phaethon (1983 TB) has no gas or dust coma, in spite of the similarity of its orbit with the Geminid meteor stream. Data were analyzed on Saturn's H2 and CH4 bands for the recent southern summer using a Tomasko-Doose type of haze distribution. This haze model fits the data moderately well, giving a CH4 mixing ratio of (4.2 + or 0.4)x003. Simple functions were found to approximate the collision-induced rotation-translation thermal opacity of H2. E.R.

Profiles were obtained for Uranus at a spectral resolution exceeding 450,000 for four quadrupole lines of H2. A preliminary reduction of the line profile for the S3(0) transition is shown. Excellent data for the determination of the HD abundance for Uranus was obtained for the R5(0) and R5(1) transitions. An HD profile is shown. Preliminary analysis yields a value for the D/H ratio similar to that for Jupiter. Complete spatial coverage was obtained of Jupiter in spectrally resolved NH3 lines for which the molecular parameters are known. The S4(1) and S3(1) H2 features for Neptune were observed. While the S4(1) feature has the same equivalent width as for Uranus, the S3(1) feature is about 40% smaller. The Titan observations have confirmed the previous observations of the 6819 A CH4 feature for Titan. The profile width is consistent with the surface pressure determined via Voyager observations. E.R.

ANALYSIS OF JOVIAN DECAMETRIC DATA: STUDY OF RADIO EMISSION MECHANISMS
David H. Staelin *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 62 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

Catalogues of approx. 200 decametric arcs and approx. 200 gaps between arcs were studied, in an effort to reconcile the data with predictions for the model wherein reflections of Io-induced currents each emit in a conical pattern and yield a distinct radio arc. The most recent interpretations of this data suggest that these Io-produced Alfven waves persist for at least one or two passages of Io, and that the emission cone half angles are approx. 40 to 90 deg., varying from arc to arc. Below 1.2 MHz it was discovered that Jupiter emits radiation strongly modulated in frequency with periods of approx. 200 kHz; this quasi-sinusoidal emission (MSA) can shift more than 180 deg. in phase over periods of 6 seconds, although these shifts are usually much smaller. MSA is not strongly correlated with the longitudes of Io or Jupiter, and typically occurs in patches covering approx. 500 kHz or more for periods of a few minutes. Furthermore, this modulation sometimes resembles a train of impulses in frequency with exponential decays toward high frequencies. Comparison of these results with the previous studies of V-shaped S-bursts is suggestive of an emission mechanism. E.R.

Uranus and Jupiter HD/H2 spectra determine bulk D/H ratios which are significantly different from theoretical expectations, with the Uranus D/H about half the Jovian value. Feasibility of Mars photochemistry study with a PEPSIOS spectrometer was demonstrated with visible band O2, H2O, and CO2 spectra; and near infrared (1.57 micron) spectra of CO and CO2; and NASA/IRTF observations have been proposed in support of the Mars Observer mission objectives. Analysis of monochromatic images clearly resolve the azimuthal and radial structure in the Jovian nebula (ion partitioning, temperature structure, ion/neutral interactions), adding a unique and important post-Voyager perspective and providing a baseline for forthcoming Galileo experiments. Simultaneous ground based and IUE observations of Jovian nebula are under analysis. Doppler resolved image sequences (data cubes) of Io sodium neutrals clearly isolate the high velocity charge exchange jet, a sensitive ground-based probe of the tenuous neutral atmosphere of Io. E.R.

The Voyager 1 and Voyager 2 narrow angle cameras have been imaging Uranus and Neptune (through several filters) from distances of several AU for the past four years. The justification for this is to determine the way in which the albedoes of the two planets vary with angle from the sun. The Voyager 1 spacecraft has already reached a phase angle of approx. 40 deg. for Neptune and approx. 70 deg. for Uranus. The albedo of a gaseous planet depends on the phase angle (angle from the sun through the planet to the observer), the color being observed, and the vertical distribution and nature of aerosols and clouds in the atmosphere of the planet. Since the colors are known and the phase angles, and phase curves will be used to constrain models of the aerosol and cloud structrures of Uranus and Neptune. A knowledge of the way albedo varies with phase angle allows one to compute the total amount of sunlight being absorbed by a planet. With knowledge of the solar flux incident on the planet and knowledge of how much infrared is being emitted by the planet (at least in the direction of the Earth and sun) one can determine a rough extimate of the internal heat source of the planet. Although Jupiter and Saturn have measured internal heat sources of magnitude comparable to their absorbed energy from the sun, preliminary results indicate that Uranus may not have an internal heat and that Neptune if it has one that heat source is small. E.R.

Narrowband CCD profiles of C2 and grains in several comets (including P/Halley and P/Giacobini-Zinner) were performed. Rotational light curves were made of Comet P/Arend-Rigaux

(visible and infrared) yielding the size, shape, albedo, and rotation period of the nucleus. Production rates were measured as a function of heliocentric distance for OH, CN, and C2 in P/Giacobini-Zinner and for OH, NH, CN, C3, and C2 in P/Halley. Detection and measurement was made of forbidden (O I) lines near 6300 and 5577 A in P/Halley, permitting the production rate of oxygen from CO to be distinguished from that from H2O. Identification of C-12C-13 lines in cometary spectra indicating a possible enrichment of C-13 over the telluric value was made. An assessment of techniques for detecting (determining the existence of) a trans-Neptunian comet belt is included. E.R.

The first comprehensive spectrophotometric survey in the near-infrared (0.8 to 2.5 microns) was carried out with the NASA Infrared Telescope Facility and special filters optimized for spectroscopy of solid surfaces. About 105 asteroids have been observed (in 52 photometric passbands) to date. These spectra provide a much improved database for determining the mineralogy of the various asteroid spectral classes previously defined on the basis of visible (0.3 to 1.0 micron) data. Preliminary results from analysis of these spectra include: (1)Class 'A' asteroids are dominated by olivine and correspond to the rare brachinite meteorites; (2)Class 'S' asteroids have highly variable olivine/pyroxene ratios inconsistent with chondritic compositions; (3)Classes 'P' and 'D' are apparently 'ultracarbonacous' material which extends the known range of chondrites to lower condensation temperatures; (4)The distribution of spectral types shows that the asteroids were heated by a mechanism whose intensity declined rapidly with solar distance; and (5)Spectra of the proposed flyby targets for CRAF were used to evaluate the results obtainable from this mission. E.R.

STUDIES OF ASTEROIDS AND COMETS
Edward L. G. Bowell, Kari Lumme, Lawrence C. Wasserman, Tobias J. N. Kreidl, Schelte J. Bus, and Brian A. Skiff *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 73-74 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

About 3000 accurate positions of asteroids and comets were measured concentrating particularly on close-Earth approachers, but also targeting asteroids in need for follow-up observations because of unusual orbital characteristics or poor observational history. In 1985, 36 of the discoveries were numbered. Very accurate + or - 0.1 arcsec?) positional measurements were made of P/Halley on four nights in November and December 1985 in support of Giotto mission navigation. The asteroid orbit files were maintained, and ephemeris data for observational planning were supplied to colleagues worldwide. Considerable progress was made in understanding how information on asteroid shapes, surface albedo variegation, and rotational states can be derived from lightcurve and phase curve data. The analytical formulation was completed of a new asteroid magnitude system for the International Astronomical Union; the system was adopted at the New Delhi General Assembly by IAU Commission 20. Photographic photometry of about 10000 images of faint asteroids observed during the course of the United Kingdom Schmidt-CalTech Asteroid Survey in 1981 was continued, completing the microdensitometric scanning and all process of software development for data handling. E.R.

IMAGING STUDIES OF COMETS
John C. Brandt *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 75 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

Extensive photography was conducted on comet Giacobini-Zinner in support of the flyby of the International Cometary Explorer (ICE) through the plasma tail on 9/11/85, and a dense series of plates was secured of Halley's Comet during the 7-month interval approximately centered on perihelion, i.e., 1985 November - 1986 May. The hundreds of high quality plates of Halley contain copious numbers of dramatic plasma events, including DE's, helical waves, and turning tail rays. Initial study of the plate material lends support to the magnetic sector boundary model of DE's developed by Niedner and Brandt. E.R.

ATLAS OF COMET HALLEY 1910 II c90
John C. Brandt and Bertram Donn *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 76 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03B

An Atlas of Comet Halley 1910 II photographs and spectra is being prepared. The major section consists of 838 photographic observations from fifteen observatories around the world. Multiple images of many photographs are reproduced to bring out detail in the near nucleus region, in the coma and in the tail. The Atlas contains a total of 1209 photographic images of the 1910 apparition. In addition there are sections showing drawings from 1935 and 1910. A short section compares 1910 drawings and photographs. The final two sections display digitally processed images from 1910 and 1910 spectra. A three part appendix contains diagrams of various data associated with the 1910 apparition, a set of tables of all 1910 images and a bibliography. Author

The study uses an emission line, differential imaging camera built by the Science Operations Branch. This instrument allows photometric data to be obtained over a large area of a comet in a large number of resolution elements. The detector is a 100x100 Reticon array which with interchangeable optics can give resolutions from 2' to 30' over a field of 1' to 15'. The camera through its controlling computer can simultaneously take images in on-line and continuum filters and through computer subtraction and calibration present a photometric image of the comet produced by only the emission of the molecule under study. Initial work has shown two significant problems. First the auxiliary equipment of the telescope has not allowed the unambiguous location of faint comets so that systematic observations could be made, and secondly initial data has not shown much molecular emission from the faint comets which were located. Work last year on a software and hardware display system and this year on additional guide motors on the 36-inch telescope has allowed the differential camera to act as its own finder and guide scope. Comet IRAS was observed in C2 and CO+, as well as an occultation by the comet of SAO029103. The perodic comet Giacobini-Zinner was also observed in C2. E.R.

Observations of Europa using the Cooled Grating Array Spectrometer have resulted in the discovery of new absorption features in the spectrum of the trailing side of Europa which have

been attributed to either magnetospherically implanted sulfur compounds or recently emplaced hydrates of ammonia. More observations are planned to determine which of these two classes of compounds are responsible. Two asteroid occultations have been observed so far, but with some negative results (the occultations paths shifted sufficiently that the groups responsible for timing the visual occultation got no data). High-quality data in the thermal infrared were obtained nevertheless; those data are useful for constraint of thermal models of asteroids and will be analyzed in that context. Work was completed to perfect a computer code that will fit a triaxial-ellipsoid thermal model to the IR data while constrained by the visual lightcurve. E.R.

INFRARED IMAGING AND PHOTOMETRY OF COMET GIACOBINI-ZINNER
Humberto Campins *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 80-81 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

Infrared images and photometry were obtained to determine the spatial distribution and physical characteristics (temperature, albedo, size distribution, total mass, etc.) of the grains in the coma of Comet GZ. A 10.8 m image of Comet GZ obtained on August 4 represents the first groundbased thermal-infrared image of a Comet. Among the most significant results are: (1)An estimate of the number of grains that the ICE spacecraft must have encountered, which led the plasma wave team to conclude that they could only detect impacts on the antennae and not on the whole body of the ICE spacecraft; (2)The discovery of a population of large grains (radius > 100 micrometer), not observed in most other comets, which formed a curved tail near the nucleus (within 80 arcsec or 34,000 km); and (3)the detection of structure in the spatial distribution in the coma of the particle albedo, which was tentatively attributed to the presence of very fluffy grains which are likely to have multiple internal scattering of incident sunlight. The albedo map of Comet GZ was obtained by combining the 10.8 micrometer image shown with a simultaneous image taken at 0.68 micrometer, a bandpass which isolates the scattered continuum. E.R.

PLANETARY ASTRONOMY
Clark R. Chapman, D. R. Davis, R. Greenberg, and W. K. Hartmann *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 82-84 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

Comets were studied during their relatively quiescent phases at large distances from the sun. This program, has resulted in a variety of CCD images of comets in several visible and near-IR bands selected to sample the continuum, rather than emission features. The most extensive dataset was obtained for P/Halley during January 1985 (plus scattered earlier data), near the time the comet turned on. The data were reduced in a preliminary fashion. Other comets predicted to be relatively inactive (including Neujmin 1 and Arend-Rigaux) were most active than expected. P/Gehrels 3 was also observed. E.R.

SPECKLE INTERFEROMETRY APPLIED TO ASTEROIDS AND OTHER SOLAR SYSTEM OBJECTS
Jack D. Drummond and E. Keith Hege *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 85-86 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

Speckle interferometry is a high angular resolution technique that allows study of resolved asteroids. By following the changing size, shape, and orientation of minor planets, and with a few general assumptions (e.g., geometric scattering, triaxial ellipsoid figures, no albedo features), it is possible to directly measure an asteroid's true dimensions and the direction of its spin axis in one or two nights. A particular subset of triaxial ellipsoid figures are equilibrium shapes, and would imply that some asteroids are thoroughly fractured. Such shapes if they exist among the asteroids would allow a determination of bulk density since there is a unique relation among spin period, size, shape, and density. The discovery of even a single rubble pile, (just as the finding of even one binary asteroid by speckle interferometric techniques) would drastically alter the notion of asteroids as small solid planets. The Pluto/Charon system was studied to aid in improving the orbital elements necessary to predict the eclipse/occultation season currently in progress. Four asteroids were reduced to their size, shape, and pole direction: 433 Eros, 532 Herculina, 511 Davida, and 2 Pallas. E.R.

PLANETARY SPECTROSCOPY
Uwe Fink *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 87-88 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

Infrared spectroscopic studies of the solar system in support of spacecraft investigations were researched. The studies include the physical behavior of comets, the atmospheres of the gaseous planets, and the solid surfaces of satellites and asteroids. Studies of the gaseous and solid emanations of comets using the techniques of CCD spectroscopy and imaging were focused on. An intensive observational effort was mounted, to observe comet Halley with the recently developed state of the art CCD camera system. Comet P/Giacobini-Zinner was observed. The major emphasis was placed on spectroscopy and a synoptic spectrum at least once a month was obtained. A large number of images of Halley for particular emission species and continuum regions were also obtained. The species in vestigated were: C3 (4060 A), CO+ (4505), C2 (5139), NH2 (5980), H2O+ (6185), OI (6300) and CN (9180). E.R.

PHOTOMETRY OF SMALL ASTEROIDS AND COMETARY CORES
Tom Gehrels, Wieslaw Z. Wisniewski, and Ben H. Zellner *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 89 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

The first asteroid lightcurves have now been made with a new technique of CCD photometry. The apparent magnitude is fainter (V>17) than what can be done with the 1.52-m Catalina reflector with a photomultiplier photometer. With the CCD system, however, the lightcurve shows remarkably good repetition; finding the asteroid is, of course, no problem as the object is recognized later by its motion on the CCD. Asteroid 1985RV has a lightcurve amplitude of about 0.4 mag and its period of rotation P = 4.0 hours, on the assumption that the lightcurve has two maxima and two minima as is the case for nearly all other asteroids. The diameter is about 3 km. 1985RV is a first example of results that are being obtained on asteroids and comets with CCD in the Catalinas, Kitt Peak, and Cerro Tololo. E.R.

CCD SCANNING FOR ASTEROIDS AND COMETS
Tom Gehrels and Robert S. McMillan *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 90-91 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

A change coupled device (CCD) is used in a scanning mode to find new asteroids and recover known asteroids and comet nuclei. Current scientific programs include recovery of asteroids and comet nuclei requested by the Minor Planet Center (MPC), discovery of new asteroids in the main belt and of unusual orbital types, and follow-up astrometry of selected new asteroids discovered. The routine six sigma limiting visual magnitude is 19.6 and slightly more than a square degree is scanned three times every 90 minutes of observing time during the fortnight centered on New Moon. Semiautomatic software for detection of moving objects is in routine use; angular speeds as low as 11.0 arcseconds per hour were distinguished from the effects of the Earth's

atmosphere on the field of view. A typical set of three 29-minute scans near the opposition point along the ecliptic typically nets at least 5 new main-belt asteroids down to magnitude 19.6. In 18 observing runs (months) 43 asteroids were recovered, astrometric and photometric data on 59 new asteroids were reported, 10 new asteroids with orbital elements were consolidated, and photometry and positions of 22 comets were reported. 511 independent fields were photographed with the 0.46m Schmidt during 15 observing runs along with a limited number of 1.2m Schmidt exposures. From these fields 122 new asteroids were reported. Special sets of field using the 1.2m Schmidt are continuing to yield numerous new faint asteroids. The combined result from both telescopes include 4 Mars-crossers, 3 Hungarias, 2 Phocaeas, a unique high inclination object (1985XB), 1 Apollo (1985PA) and Aten (3362) Khufu. Halley was regularly monitored (astrometry and large-scale phenomena) IHW participation. Scientifically value photographs were obtained from both 0.46m and 1.2m Schmidt Telescopes. Other accessible comets were observed including G-Z. Recently a new comet (1986d) was discovered. E.R.

RADIATIVE TRANSFER IN PLANETARY ATMOSPHERES c91
William M. Irvine and F. Peter Schloerb *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 96-97 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

The research effort was concentrated toward comet P/Halley, although observations of other comets including Giacobini-Zinner, Hartley-Good and Thiele were made as opportunities arise. In preparing for the apparition of P/Halley, detailed predictions for the emission in the 18 cm OH transitions were made in order to assist observers and to indicate what type of data would be particularly valuable. Likewise, since occultations by the comet of background radio sources can provide unique types of information, the tracks of P/Halley and P/Giacobini-Zinner were surveyed with the NRAO Very Large Array, background sources were mapped, and a catalogue of occulted sources published. Beginning in September, 1985, regular observations of the 18 cm OH lines have been made for P/Halley using the 43 m antenna of the NRAO in Greenbank, West Virginia. These data promise to provide the most accurate time sequence for the OH emission for any comet ever obtained at radio wavelengths. From the linewidth and shape, information is obtained on the kinetics of the gas in the cometary coma. An extensive series of observations have been undertaken with 14 m antenna to study emission from the HCN molecule in P/Halley. These data provide the first definitive detection of this component of the cometary ices. Interesting variations in the production of HCN were observed with time scales less than a day. Likewise, there appeared to be variations in the ratio of the hyperfine components of the J = 1-0 transition. E.R.

The spectroscopic and morphological characteristics of comets over a wide range of heliocentric distances are investigated as they may suggest or constrain models of cometary formation environments and evolution. This program also contributes to the understanding of the general comet population with which spacecraft data will be compared. Long slit spectra and direct images of all observable comets (M2<18) are obtained on a monthly basis with either a UV sensitive microchannel plate or a red sensitive CCD spectrograph/camera. Scale lengths of the principal emission of OH, NH, CN, C3, C2, NH2 and OI different comets can be compared. The direct images are used for studies of dust anisotropy which can provide data on the spin vector and gross surface morphology. Author

INFRARED OBSERVATIONS OF PLANETS
Larry A. Lebofsky and George H. Rieke *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 102-103 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

A positive correlation was found between the strength of the 3-micron water feature and the strength of the absorption feature shortward of 0.4 microns. This is similar to what is seen in laboratory spectra of carbonaceous chondrites whose silicate compositions range from hydrated phyllosilicates to anhydrous olivine. Features were found in the IRAS images that appear to be related to solar system objects. Analysis of the data has yielded narrow trails of dust coincident with the orbits of comets Temple 2, Encke, and Gunn. Dust is found both ahead and behind comet orbital positions due to low-velocity ejection of large particles during perihelion passage. The occultation diameters of Ceres and Pallas were used

to improve the standard thermal model used in the reduction of thermal IR observations of asteroids. E.R.

Work on asteroid classification continued was rewarded with the discovery of two Earth-approaching M asteroids. The M class is rare and these are the first found among the near-Earth asteroids to have the spectral albedo characteristic of this class. The two asteroids are newly discovered 1986 DA and 1986 EB which were observed at N and Q bandpasses (i.e., 10 and 20 microns) with the 3 m IRTF telescope and at five wavelengths from 0.36 to 0.85 microns from Kitt peak National Observatory's 0.36 m telescope. The derived diameters are about 2 km for both objects. In the asteroid radiometry program N or Q photometry was obtained for more than 40 asteroids in Feb. 1986. Radiometric diameter calibration support were provided for stellar occultations of stars by 230 Athamantis and 129 Antigone. The data were reduced but not analyzed. Infrared spectra (0.8 to 2.6 microns) of 60 asteroids were reduced and are now ready for compositional analysis. E.R.

During the past year some 500 observations were made on 66 nights and published on the MPCs (Minor Planet Circulars/ Minor Planets and Comets). In addition, a handful of measurements of earlier plates were completed and published. 121 of the observations published referred to comets. Of special importance were observations of comets (P/Giacobini-Zinner and P/Halley) in connection with the NASA ICE and ESA Giotto missions, but a special effort was made to get good coverage of almost all of the observable comets. Observations were also made of (2060) Chiron and of the earth-approaching objects (1627) Ivar, (1866) Sisyphys, (1943) Anteros, (3362) 1984 QA, 1985 JA, PA, TB and WA, and 1986 DA and EB. 46 minor planets were given permanent numbers entirely as a result of the observations. PLANET-CROSSING ASTEROIDS: INTERRELATIONSHIPS WITHIN THE SOLAR SYSTEM c90
Lucy-Ann McFadden and Michael F. AHearn *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 106-107 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03B

Near-infrared reflectance spectra 0.6 to 2.5 micrometer were acquired of asteroids 1627 Ivar (Amor), 43 Ariadne, 335 Roberta, 386 Siegena and 695 Bella (3:1 Kirkwood Gap) with the IRTF, Mauna Kea. CCD spectra 0.5-1.0 micrometer were acquired of 1866 Sisyphus (Apollo), 17 Thetis, 695 Bella, 797 Montana, and 877 Walkure (3:1 Kirkwood Gap) using facilities at Cerro Tololo Inter-American Observatory. An upper limit on the production rate of CN in asteroid 3200 Phaeton of $< 4 \times 10$ to the 23rd power sec was determined based on photometric measurement: at 3871A using facilities at Lowell Observatory. This value is in the range of the lowest production rate measured for a comet, however, it does not constitute a positive detection of CN in this asteroid. A first attempt of look for companion objects or evidence of dust debris associated with this asteroid was made with a CCD camera. Whereas the search extended to 19th magnitude (corresponding to 150m and 330m for albedos of 0.15 and 0.03 respectively), a look close enough to the asteroid was not attained to definitively eliminate the presence of coorbiting dust debris. E.R.

Since 1969 every bright comet was measured which has reached a distance of one astronomical unit from the sun. Observing techniques were developed which make it possible to observe as close as elongation 3 deg., and to find, track and measure comets at all wavelengths in full daylight. Comet Halley was measured on twenty four occasions between December 12, 1985 and March 25, 1986. Clear weather seems to come on holidays, and days on which are observed including Winter Solstice, Christmas, New Years, Valentines day, Super Bowl Sunday and the Vernal Equinox. Halley is observed within hours of perihelion passage. Author

RADAR INVESTIGATION OF ASTEROIDS c32
Steven J. Ostro *In* NASA, Washington Reports of Planetary

Astronomy, 1985 Sep. 1986 p 118-119 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 17I

The number of radar detected asteroids has climbed from 6 to 40 (27 mainbelt plus 13 near-Earth). The dual-circular-polarization radar sample now comprises more than 1% of the numbered asteroids. Radar results for mainbelt asteroids furnish the first available information on the nature of these objects at macroscopic scales. At least one object (2 Pallas) and probably many others are extraordinarily smooth at centimeter-to-meter scales but are extremely rough at some scale between several meters and many kilometers. Pallas has essentially no small-scale structure within the uppermost several meters of the regolith, but the rms slope of this regolith exceeds 20 deg.; much larger than typical lunar values (approx. 7 deg.). The origin of these slopes could be the hypervelocity impact cratering process, whose manifestations are likely to be different on low-gravity, low-radius-of-curvature objects from those on the terrestrial planets. The range of mainbelt asteroid radar albedoes is very broad and implies big variations in regolith porosity or metal concentration, or both. The highest albedo estimate, for 16 Psyche, is consistent with a surface having porosities typical of lunar soil and a composition nearly completely metallic. Therefore, Psyche might be the collisionally stripped core of a differentiated small plant, and might resemble mineralogically the parent bodies of iron meteorites. E.R.

GROUND-BASED OBSERVATION OF COMET HALLEY
Frank Scherb and Fred L. Roesler *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 120-121 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

Approximately five hundred Fabry-Perot scans of H2O+, H alpha, and (OI) emissions from comets Halley, Hartley-Good, and Thiele were obtained at Kitt Peak in November, December and January. The analysis of the data is in a very early stage, but preliminary results were obtained on the production rate Q(H) of hydrogen, Q(D) of metastable oxygen, and Q(H2O) of water. The rate Q(H) varied with heliocentric distance R as R to the power -3.5 + or - 0.5. The rate Q(D) varied as R to the power -4.8 + or - 0.1. The ratio of Q(H2O) to Q(D) was 15 + or - 5. E.R.

RECOVERY OF THE UCAS ASTEROIDS
Eugene M. Shoemaker and Schelte J. Bus *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 122-123 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

The astrometric measurements of the original 1961 UCAS survey plates were computed, leading to a grand total of 1252 orbits for newly discovered asteroids ranging in absolute magnitude from H = 10.5 to 19.5. New programs were created and existing computer routines were revised at Lowell Observatory, which has streamlined the process of correctly identifying asteroid images on archival photographic plates. The recovery and accurate measurements were made of 130 UCAS asteroids at other oppositions on plates taken by C. T. Kowal at Palomar Mountain in 1978 and 1979. When added to the 90 other UCAS objects identified by other investigators, this brings the total of multiple-opposition orbits to 220. Of the 56 UCAS asteroids known to be planet crossing, 11 were recovered at second oppositions. The recovery and accurate measurements of about 20 non-UCAS asteroids identified on the plates were examined. E.R.

HIGH RESOLUTION SPECTRAL IMAGERY OF COMETS
William Hayden Smith *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 124 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

C-13/C-12 data at a spectral resolution of 75,000, resolving the background interferences was obtained. Some data was obtained for N-15/N-14. In April, observations were obtained for the D/H ratio. The model analysis of these observations is beginning with the goal of presentation at the Heidelberg Halley meeting. A very large quantity of observations were obtained of both features with variations on the time scale of an hour being measured. At times, the 5577 feature dominates, and at times it is nearly absent. To date, a large body of data have been obtained for C2, NH2, (O I), and probably H2O+, CN, and from the MKO data, OH. These features can all be correlated with respect to their relative velocities and distribution at the time of observation. The Greenstein effect will be used to measure similar results for CN, OH, and few other selected molecular features. E.R.

A SEARCH FOR EARTH-APPROACHING ASTEROIDS
L. G. Taff *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 127 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

New automated methods were developed for the detection and discrimination of Earth-approaching asteriods. Specifically, utilizing state-of-the-art, electron-bombarded, silicon diode, beam scanned, low light level television cameras and the most advanced video processing equipment available. The improvement of the limiting magnitude for a 50% probability of detection, increase the areal search rate, and minimize the burden on humans of the search effort. To this end, three increasingly automated and sophisticated versions of the data acquisition, storage, and processing systems, were designed and implemented. The celestial sphere were searched for Earth-approaching minor planets. An example of this effort is the recent cataloging of 1982 HS=3343 VNEDZEL. This particular high eccentricity, high inclination object is of a type even more rare than are Earth-approaching asteriods. Several of these were found. E.R.

PHYSICAL PROPERTIES OF ASTEROIDS c90
Glenn J. Veeder *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 ' p 131-132 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03B

The physical properties of asteroids were studied by telescopic observations and laboratory and theoretical work. Spectrophotometry from 0.3 to 1.1 microns and 1.2, 1.6 and 2.2 micron photometry allow spectral-compositional classification of asteroids. Based on laboratory data and telescopic observations, it was found that infrared measurements at 1.2, 1.6 and 2.2 microns provide a relatively rapid and accurate method for the classification of minor planets and are important in comparing asteroids with meteorites. This technique was proven and employed in an expanded survey of Apollo-Amor-Aten and other unusual asteroids recently scanned by IRAS. Author

PASSIVE MICROWAVE REMOTE SENSING OF THE ASTEROIDS USING THE VLA: CONTINUATION c32
William J. Webster, Jr. *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 133-134 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 17I

The structure and composition parameters for a selected set of the main belt asteroids were inferred by employing microwave remote sensing techniques developed for Earth observations. Precise flux density measurements made with the Very Large Array (VLA) and the 11 m mm-wave antenna of the National Radio Astronomy Observatory are used to define the microwave continuum spectra of these asteroids. These spectra were inverted in order to estimate the near-surface bulk properties (radii, roughness, composition) independent of previous optical or infrared spectroscopy. Author

Comets constitute the most accessible samples of the outer solar system in its most primitive state. The physical and chemical properties of comet nuclei were determined to infer the conditions and processes related to the origin and evolution of the outer solar system. The procedure is to acquire and analyze digital spectra of a sample of comets covering a large range in heliocentric distance. During 1984 to 1986 the emphasis has been on Comet P/Halley (1982i). Large ground-based telescopes and state-of-the-art detectors were used to observe Comet P/Halley pre- and post-perihelion, covering a heliocentric distance range, 0.9 to 6.1 AU. Author

COMETARY DYNAMICS c90
Donald K. Yeomans *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 138 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03B

In order to provide observers with accurate cometary ephemerides, up-to-date astrometric positions must be used to update the existing orbit and ephemeris for each object. In addition, nongravitational forces must be taken into account; these forces are assumed due to the rocket effect of outgassing cometary ices. Once successfully modeled, the cometary nucleus spin direction, spin axis evolution, and the volatility of the nucleus ices can be inferred. The predicted ephemerides also become far more accurate. WORKSHOP ON EARTH-ORBITAL PLANETARY ASTRONOMY
Jay T. Bergstrahl and Michael J. S. Belton (Kitt Peak National Observatory, Tucson, Ariz.) *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 141-142 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

During the last 15 years, a revolution has occurred in the understanding of the physical nature of the solar system. The most conspicuous contributions have come from investigations on spacecraft, ranging from the early Explorers to the current Voyagers. Less conspicuous but equally important are the discoveries that have come from parallel investigations in ground-based, airborne and Earth-orbital astronomy. The role of Earth-based remote observations in achieving the goals of Solar System Exploration's Planetary Astronomy Program are currently under review. To assess the specific need for future Earth-orbital facilities, a workshop was convened at Jet Propulsion Laboratory on 13 to 15 January, 1986. The charter of the workshop included requests to (1)identify and need for Earth-orbital observations within the context of the current goals of the Solar System Exploration Program and (2)identify candidate facilities and instruments required to support these needs. SPECTROSCOPIC PLANETARY DETECTION
Drake Deming, Fred Espenak, John J. Hillman, Theodor Kostiuk, Michael J. Mumma, and Donald E. Jennings *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 143-144 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

The Sun-as-a-star was monitored using the McMath Fourier transform spectometer (FTS) on Kitt Peak in 1983. In 1985 the first measurement was made using the laser heterodyne technique. The FTS measurements now extend for three years, with errors of order 3 meters/sec at a given epoch. Over this 3 year period, a 33 meter/sec change was measured in the apparent velocity of integrated sunlight. The sense of the effect is that a greater blueshift is seen near solar minimum, which is consistent with expectations based on considering the changing morphology of solar granular convection. Presuming this effect is solar-cycle-related, it will mimic the Doppler reflex produced by a planetary companion of approximately two Jupiter masses, with an 11 year orbital period. Thus, Jupiter itself is below the threshold for detection by spectroscopic means, without an additional technique for discrimination. However, for planetary companions in shorter

period orbits (P approx. 3 years) the threshold for unambiguous detection is well below one Jupiter mass. Author

STELLAR OBSERVATIONS WITH THE VOYAGER EUV OBJECTIVE GRATING SPECTROGRAPH
Jay B. Holberg, R. S. Polidan, and D. C. Barry *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 148-149 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

During the periods of interplanetary cruise the Voyager ultraviolet spectrometers are used to provide unique and otherwise unobtainable observations in the extreme ultraviolet (EUV, 500 to 1200) and the far ultraviolet (FUV, 912 to 1220 A). These observations include the spectra of hot stellar sources as well as emission from the interplanetary medium. Recent results of note include: (1)Extensive spectrophotometric coverage of a superoutburst of the dwarf nova VW Hydri, which showed a clear 1/2 day delay in the outburst at 1000 A relative to that observed in the optical and a curious dip in the FUV light curve near maximum light. The Voyager observations were part of a comprehensive and highly successful campaign involving EXOSAT, IUE and ground based observations of this dwarf nova; (2)A comprehensive study of Be star spectra and variability. These results show the critical importance of FUV observations in the study of the effects of stellar rotation in hot stars; (3)The detection of a strong O VI absorption feature in the spectrum of the PG 1159-like object H1504+65. This detection along with the optical identification of weak O IV lines was a key to the interpretation of this object; which is of extremely high (>150,000K) temperature and appears to be a unique example of a stellar atmosphere devoid of H and He; (4)An analysis of an extremely long duration spectrum of the EUV and FUV sky background, which establishes important new upper limits on both continuum and line emission. This result also provide the first detection of interplanetary Lyman gamma. Author

THE RADIAL VELOCITY SEARCH FOR EXTRASOLAR PLANETS c90
Robert S. McMillen and Peter H. Smith *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 150-151 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03B

Stars are observed with a ground-based instrument designed to measure small changes in the line-of-sight velocities. The purpose of the observations is to detect large planets by the oscillatory reflex motion they induce on the stars they are orbiting. The instrument is an optical spectrometer for which wavelengths are first calibrated by transmission through a tunable Fabry-Perot etalon interferometer. Changes in the line-of-sight velocities are revealed by changes in the Doppler shift of the absorption-line spectra of stars. The scrambling of incident light by an optical fiber and the stability of wavelength calibration by a tilt-tunable Fabry-Perot etalon provide immunity to systematic errors that historically have effected more conventional radial velocity spectrographs. A cross-dispersed echelle spectrograph spatially separates the orders of constructive interference transmitted through the etalon. Selecting several echelle diffraction orders in the vicinity of 4250 to 4750 A, which are imaged on a CCD, about 350 points on the profile of the stellar spectrum are sampled by successive orders of interferometric transmission through the etalon. JETS, MASS OUTFLOWS AND DISKS ASSOCIATED WITH YOUNG STELLAR OBJECTS c90
Stephen E. Strom *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 152-155 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03B

Over the past 3 years, a series was obtained of the CCD images of regions surrounding young stellar objects (YSO's) located in a variety of environments with the goal of providing a census of the properties of mass outflows associated these objects. A catalog describing the optical morphology and kinematics of 38 mass outflows associated with young stellar objects (YSOs) was completed. The direct detection was reported of disks surrounding HL Tau and LI551/IRS 5 -- both sources of optical jets and large-scale mass outflows. In each case, the disk dimensions are on the order of several hundred astronomical units and the disk dust masses approximately 10 to the -7th power solar masses. A program aimed at indirect detection of circumstellar disks associated with YSOs was started. The technique involves comparison of an observed bolometric luminosity (L(bol)) with an independent measure of the true luminosity (L(spec)) of a YSO which derives from the observed strengths of surface-gravity-sensitive spectral features. E.R.

PLANETARY OPTICAL AND INFRARED IMAGING
Richard J. Terrile and Bradford A. Smith *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 156-157 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

Images were acquired of a circumstellar disk of orbiting material around the nearby star beta Pictoris. This material is believed to be associated with the formation of planets and provides a first look at a planetary system much younger than our own. Preliminary work was also done to acquire multicolor photometric data and polarimetry on the beta Pictoris disk as well. A coronagraphic search for other proto-planetary systems is also underway. Coronagraphic imaging provided the first clear images and a determination of the geometric albedo of the rings of Uranus. A search for material around the asteroid Amphitrite showed that the region around the asteroid was free of particles larger than 500 meters in radius or diffuse material with an optical depth larger than .000001. NASA IRTF infrared images of Jupiter and Saturn are providing information on the relative heights and cloud top temperatures of atmospheric features. Author

A RESEARCH PROPOSAL ON SPECTROSCOPY OF GASES AND SOLIDS OBSERVED IN THE SOLAR SYSTEM
Francisco P. J. Valero, Louis J. Allamandola, Charles Chackerian, Jr., Lawrence P. Giver, and David Goorvitch *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 167-168 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

It is well recognized and accepted that the interpretation and analysis of any type of remote planetary spectroscopic observation requires that basic molecular parameters be available. Furthermore, the newly developed capabilities of air, ground, and space borne spectrometers trained on bodies in the solar system are producing results which are extremely difficult to understand on the basis of available data. This is particularly true in the case of spectral features arising from gases and volatiles condensed as ices. With the objective to continue to extend the understanding of spectroscopic observations of solar system objects (including comets), laboratory studies of both gas phase molecules and ices and dusts are proposed. THE INTERNATIONAL HALLEY WATCH
Ray L. Newburn, Jr. *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 171-173 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

The International Halley Watch has been designed to maximize the scientific value of ground-based observations of Halley's Comet. Important in their own right, such observations have also enhanced the value of space observations, setting the brief duration flyby data in the context of the overall apparition, placing the extremely high resolution encounter data into the normal scale of observations, and filling in missing data. The IHW has standardized observing techniques wherever useful and possible, coordinated the observing, and is now collecting data from publication in a comprehensive Halley Archieve. The IHW has been designed to avoid the problems of 1910 where the two major monographs on Halley were not published until 21 and 24 years later and where much data remains unpublished to this day. The Giacobini-Zinner Watch preovided support to the ICE mission and complements the IHW by using the same ground-based techniques at the same time of study another very different comet for comparison. INTERNATIONAL HALLEY WATCH: DISCIPLINE SPECIALISTS FOR PHOTOMETRY AND POLARIMETRY
Michael F. AHearn *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 174 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

The last of the 75 sets of standard filters were distributed, including re-allocation of several sets from north to south at the beginning of 1986. Observations of the photometric standard stars from several observatories were collected and synthesized into a standard system of magnitudes. Transformation equations were derived to yield absolute fluxes in various cometary emission bands and in the continuum. These transformations turned out to vary with the comet's radial velocity for some filters and with the filter's temperature for some filters, and from one set of filters to another, all effects were quantitatively assessed. Non-linearities in the extinction, observed through the OH filter, were modelled and techniques for linearizing the extinction were developed. Although not among the official goals of the IHW, NASA Headquarters chose to work through the IHW to develop two CCD camera systems. Two iterations of an archive format were performed and a third is in the works. E.R.

INTERNATIONAL HALLEY WATCH: DISCIPLINE SPECIALISTS FOR LARGE SCALE PHENOMENA
John C. Brandt and Malcolm B. Niedner, Jr. *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 175-176 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

The largest scale structures of comets, their tails, are extremely interesting from a physical point of view, and some of their properties are among the most spectacular displayed by comets. Because the tail(s) is an important component part of a comet, the Large-Scale Phenomena (L-SP) Discipline was created as one of eight different observational methods in which Halley data would be encouraged and collected from all around the world under the aspices of the International Halley Watch (IHW). The L-SP Discipline Specialist (DS) Team resides at NASA/Goddard Space Flight Center under the leadership of John C. Brandt, Malcolm B. Niedner, and their team of image-processing and computer specialists; Jurgan Rahe at NASA Headquarters completes the formal DS science staff. The team has adopted the study of disconnection events (DE) as its principal science target, and it is because of the rapid changes which occur in connection with DE's that such extensive global coverage was deemed necessary to assemble a complete record. INTERNATIONAL HALLEY WATCH: DISCIPLINE SPECIALISTS FOR RADIO SCIENCE
William M. Irvine, F. P. Schloerb, E. Gerard, R. D. Brown, and P. Godfrey *In* NASA, Washington Reports of Planetary Astronomy, 1985 Sep. 1986 p 177-178 (For primary document see N87-12407 03-89)
Avail: NTIS HC A10/MF A01 CSCL 03A

Some 34 radio observatories in 18 countries are participating in the Radio Science Net of the International Halley Watch. Approximately 100 radio astronomers are contributing to this effort, which has included observations of comets P/Crommelin and P/Giacobini-Zinner as well as P/Halley. It is clear that the record of data for the 18 cm OH ground state lambda doublet, which provides fundamental information on the gas production rate, kinematics, and potentially the magnetic field in the coma, will be vastly more complete and of higher accuracy than has even been obtained on any previous comet. The coverage by a number of radio observatories will enable short period variations to be studied and correlated with simultaneous data obtained at other wavelengths. Likewise, the first definitive detection of the important parent molecule hydrogen cyanide in a comet was obtained and is being studied by groups in the United States, Sweden, and France. The first detection of the comet with the Very Large Array telescope operated by NRAO was achieved and has produced exciting results for the distribution of emission at high angular resolution from the OH radical. At this writing data are still being obtained and being processed, and there are still strong indications that exciting information will be obtained from radar studies of P/Halley and from searches for additional parent molecules. The purpose of the Near-Nucleus Studies Net is to study the processes taking place in the near-nucleus environment as they relate to the nature of nucleus. This accomplished by measuring the spatial and temporal distribution of dust, gases and ions in the coma on high resolution images taken from many observatories around the world. By modeling the motions of discrete dust features in Comet Halley, it is often possible to determine the locations of the emission sources on the surface and learn about the nucleus structure. In addition to the general goals shared by all IHW nets, the scientific goals of the net has been to determine (1)the gross surface structure of the nucleus, (2)the nucleus spin vector, (3)the distribution and evolution of jet sources and (4)the interrelationships between the gas, dust and ion components of the coma. An additional Comet Giacobini-Zinner watch was carried out by the NNSN in support of the NASA International Cometary Explorer flyby. Author

The Astrometry Network of the International Halley Watch (IHW) has organized and coordinated more than 300 astrometric observers from 47 countries in an effort to provide for accurate positional information on comets Halley and Giacobini-Zinner. This information is being used to constantly update the existing orbits and ephemerides for the various flight projects to these two comets and also for the other ground-based observers within the IHW organization. The astrometric data, as well as the resultant orbits and ephemerides, are being distributed to all requesting observers and they will be cataloged within the general IHW archive system. Author

HIGH ANNULAR RESOLUTION STELLAR INTERFEROMETRY Final Report, 1 Dec. 1980 - 30 Nov. 1984
J. C. Dainty 31 Jul. 1985 255 p
(Grant AF-AFOSR-0003-81)
(AD-A168755; AFOSR-86-0312TR) Avail: NTIS HC A12/MF A01 CSCL 03/1

Research carried out on high annular resolution stellar interferometry is divided into many headings. Some areas of research are atmospheric turbulence, space time structure of images, speckled speckle, and detection of grating behind diffusers. Other areas of investigation are the phase problem, infrared speckle interferometry and phase conjugation. E.R.

A NEW CROSS-CORRELATION METHOD TO DERIVE SHIFTS FROM STELLAR SPECTRA
P. Monderen, C. deLoore, and P. J. Rousseeuw 1985 22 p
(Rept-85-38; ETN-86-98468) Avail: NTIS HC A02/MF A01

A method to determine shifts between stellar spectra, based on the sum of the absolute values of the differences of the intensities is proposed. A minimum of the objective function is sought, and it becomes much easier to determine the optimal wavelength shift. The method is robust against inaccuracies in the data, making it especially appropriate to analyze fuzzy data. The method was tested on artificial profiles as well as on the spectrum of Beta Arietis and the light curve an Al Velorum star. In all cases it compares favorably with the classical approach. ESA

ASTRONOMICAL OBSERVATIONS WITH AN INFRARED ARRAY CAMERA Ph.D. Thesis
Richard Mark Tresch-Fienberg 1985 251 p
Avail: Univ. Microfilms Order No. DA8602271

Astronomical observations with an infrared array camera demonstrate that arrays are excellent for high spatial resolution photometric mapping of celestial objects. A 16 x 16 pixel array camera system based on a bismuth-doped silicon charge injection device optimized for use in the 8 to 13 micron atmospheric window is described. Observing techniques and image processing algorithms that are unique to the use of an array detector are also discussed. Multi-wavelength, 1 to 2 arcsec resolution images of three different celestial objects are presented. For the galactic center, maps of the infrared color temperature and emission optical depth are derived. The results are consistent with a model in which a low density region with a massive luminosity source at its center is encircled by a ring of gas and dust from which material may be infalling toward the nucleus. Multiple liminosity sources are not required to explain the infrared appearance of the galactic center. Images of Seyfert galaxy NGC 1068 are the first to resolve the infrared structure of the nucleus and show that it is similar to that at optical and radio wavelengths. Infrared emission extended northeast of the nucleus is identified with the radio jet. Combined with optical spectra and charge coupled device images, the new data imply a casual relationship between the Seyfert activity in the nucleus and the starburst in the disk. Infrared images confirm the presence of two populations of dust grains having different spatial distributions in planetary nebula NGC 7027. Continuum and unidentified feature emission appear to arise from different regions within and perhaps immediately surrounding the ionized zone. Dissert. Abstr.

THE OBSERVATION AND ANALYSIS OF LUNAR OCCULTATIONS OF STARS WITH AN EMPHASIS ON IMPROVEMENTS TO DATA ACQUISITION INSTRUMENTATION AND REDUCTION TECHNIQUES Ph.D. Thesis
Glenn H. Schneider 1985 534 p
Avail: Univ. Microfilms Order No. DA8606759

A program of observation and analysis of lunar occultations was conceived, developed, and carried out using the facilities of

the University of Florida's Rosemary Hill Observatory (RHO). The successful implementation of the program required investigation into several related areas. First, after an upgrade to the RHO 76-cm. reflecting telescope, a microprocessor controlled fast photoelectric data acquisition system was designed and built for the occultation data acquisition task. Second, the currently available model-fitting techniques used in the analysis of occultation observations were evaluated. A number of numerical experiments on synthesized and observational data were carried out to improve the performance of the numerical techniques. Among the numerical methods investigated were solution schemes employing partial parametric adjustment, parametric grouping into computational subsets, and preprocessing of the observational data by a number of smoothing techniques for a variety of noise conditions. Third, a turn-Key computational software system, incorporating data transfer, reduction, graphics and display, was developed to carry out all the necessary and related computational tasks in an interactive environment. Twenty-four occultation observations were obtained during the period March 1983 to March 1984. The observational data and the solutions resulting from the subsequent reductions are presented graphically and tabularly for each of the occultation events. Several angular diameter determinations were made. Among those of particular interest were 32 Librae, 1 Geminorum-B1, and X07596. The visual/spectroscopic binary 1 Geminorum was discovered to have a fourth, previously undetected, component. Two other stars, X13534 and X13607, were found to be binary with companions closer than 15 milliseconds of arc. Previously unknown faint companions were discovered for ZC1221 and ZC0126. Dissert. Abstr.

MULTIWAVELENGTH STUDIES OF CYGNUS X-3 Ph.D. Thesis
Lawrence Alan Molnar 1985 216 p
Avail: Univ. Microfilms Order No. DA8602248

Observations of low-level radio emission from Cyg X-3 show that this emission is characterized by successive flares whose spectral evolution is similar to the giant radio flares observed in Cyg X-3. As with the giant flares, we interpret these flares to be expanding sources of electron synchrotron radiation. We find that the timing of the flare onsets are periodic with a period several percent longer than the binary orbital period. We suggest the radio period is the result of periodic modulation of the binary separation. Modulation at the radio period may be caused by precession of the line of apsides in an eccentric orbit. We perform three body simulations that show that the modulation of the binary separation in a triple system may mimic the radio period much of the time, but would also show well-defined phase jumps twice per orbit of the third star. We present VLBI data at 1.3 cm wavelength that confirm our interpretation of the flares as expanding sources. We find that the effect of X-ray scattering by the interstellar medium on the observed X-ray light curve is to decrease the depth of modulation from its intrinsic value for photon energies less than 6 keV. EXOSAT observations of the X-ray light curve show that the shape of the light curve as well as its depth is dependent on photon energy. These data are not consistent with either cocoon or stellar wind models for the light curve. They are consistent with an accretion disk corona model. We review the evidence for detections of gamma rays and secondary muons from Cyg X-3 and find no convincing evidence for either. Dissert. Abstr.

N87-12503 Johns Hopkins Univ., Baltimore, Md.
X-RAY AND RADIO IMAGES OF FOUR SUPERNOVA REMNANTS WITH THREE DISTINCT X-RAY SIGNATURES Ph.D. Thesis
Yutaka Matsui 1986 156 p
Avail: Univ. Microfilms Order No. DA8601282

Radio images of Kepler's supernova remnant (SNR) and new X-ray images of the three SNRs--PKS1209-52, W28, and 3C400.2 were investigated. Although all of them are shell-like SNRs at radio wavelengths, there are distinct X-ray signatures among them. New high resolution radio images of Kepler's SNR reveal shell structure which is very similar to that of the X-ray image. Linear polarization mapping at 6 cm shows the existence of a radial component in the magnetic field. There is a correlation between rotation measure and X-ray surface brightness, which makes it possible to estimate a total magnetic field of 7 x 10(-5) gauss and an energy density of relativistic electron 6 x 10(-10) ergs cm(-3) in the shell. The correlation between radio emissivity and X-ray emissivity can be ascribed to acceleration of thermal electrons to relativistic energies at the shock front. The X-ray image of PKS1209-52 reveals fragmented shell structure which resembles the radio image. There is, however, a compact X-ray source near its center. The inhomogeneous nature of the X-ray emission is most likely a result of the interaction of the blast wave with the inhomogeneous interstellar medium. The age of PKS1209- 52 is in the range 10,000 to 23,000 years depending on the nature of the ambient medium. The SNRs W28 and 3C400.2 have centrally-peaked X-ray emission despite their radioshell morphologies. Comparisons of their X-ray and radio properties with known Crab-like SNRs suggest that the synchrotron radiation process is not a very plausible X-ray production mechanism. If the SNRs have evolved in relatively dense regions as suggested by radio and optical observations, they may have already evolved into the late adiabatic or radiative stage. Dissert. Abstr.

OPTICAL SPECTROSCOPIC STUDIES OF WOLF-RAYET CARBON AND OXYGEN STARS Ph.D. Thesis
Ana Victoria Torres 1985 164 p
Avail: Univ. Microfilms Order No. DA8608647

This thesis analyses the optical spectra of 65 galactic and 18 LMC WC and WO stars. Up to now, the classification of WC stars had been based on visual estimates of ratios of line strengths. Using the ratios of O V 5590 A, C III 5696 A and C IV 5801,12 A, and the full width half maximum (FWHM) of the lambda 4650 line, I have quantified the WC subtype classification, which represents an ionization/excitation sequence. A few galactic stars are reclassified and nearly all LMC stars are found to be of subtype WC4, rather than WC5, as previously classified. The wind terminal velocities are estimated for the majority of the stars in our sample by using the property that the FWHM of the lines correlate with excitation potential. In those cases when the ultraviolet (UV) spectrum is available, the agreement with the terminal velocity measured from UV P Cygni profiles is very good. The values range between 800 and 5000 km s(-1), with the earliest WC subtypes showing the highest velocities. Two WO stars show terminal velocities as high as 6000 and 7000 km s(-1). The C/He ratio is determined for WC stars using local thermodynamic equilibrium (LTE) and recombination theory. These models give C/He ratios larger than those calculated by other means and they are several times greater than solar, in agreement with evolutionary models of stars that are burning helium in the core. The calculations suggest that the C/He ratios do not depend on spectra subclass. If true, this implies that there is no evolutionary connection between WCE and WCL stars. Dissert. Abstr.

AN XUV SPECTROSCOPIC OBSERVATION OF THE WHITE DWARF STAR HZ 43 Ph.D. Thesis
Walter Hal Tompkins 1986 91 p
Avail: Univ. Microfilms Order No. DA8608237

A soft X-ray objective grating spectrometer utilizing grazing incidence optics was designed for astronomical observations, assembled at Stanford, calibrated and flown in 1983. The target was the hot white dwarf star HZ 43, which is of particular interest because it is one of the two brightest non-solar extreme ultraviolet sources in the sky. The emission is thought to be thermal in origin, with an effective temperature of 60,000 degrees. The basic experimental configuration involved a confocal, coaxial pair of nested Wolter-Schwarzschild Type 1 telescopes, an annulus of free standing gold 500 l/mm transission gratings, and a microchannel plate detector in the focal plane with proximity focussed resistive anode readout. The point response function was measured in the visible. The angular size (full width at half maximum) was 25 arc seconds with a sharp central core of less than 5 arc second angular extent. The instrument as a whole was calibrated

in a vacuum facility at U.C. Berkeley. Each telescope was illuminated with a pencil of monochromatic light at the following wavelengths: 68, 130, 160, 170, 218, and 256 A. A gas flow proportional counter was used as an absolute detector to monitor the source intensity. Maximum sensitivity was between 60 to 150 A with a peak spectrometer effective area including both first orders of 0.2 cm(2). Dissert. Abstr.

N87-12506 Harvard Univ., Cambridge, Mass.
X-RAY STUDIES OF BL LACERTAE OBJECTS Ph.D. Thesis
Grzegorz Maria Madejski 1986 254 p
Avail: Univ. Microfilms Order No. DA8609747

Spectral X-ray data is presented for BL Lac objects observed by the Imaging Proportional Counter (IPC) and the Monitor Proportional Counter (MPC) aboard the Einstein Observatory and the data are interpreted in a context of overall radiation spectra using synchrotoron and synchrotron self-Compton models. The objects considered are: OJ 287, PKS 0735+178, I Zw 186, PKS 0548-322, Mkn 180, BL Lacerte, PKS 2155-304, H 0414-009, and H 0323+022. The overall electromagnetic distribution in those objects as arising due to the synchrotron process was interpreted in at least two spatial regions, with sizes respectively: approximately 10 to the 18th power cm for the radio component and approximately 10 to the 16th power cm for the optical component.Dissert. Abstr.

N87-12507 California Univ., Los Angeles.
A PHOTOMETRIC INVESTIGATION OF THE RICH SUPERCLUSTER FOURTEEN FIFTY-ONE PLUS TWENTY-TWO Ph.D. Thesis
Robin Bruce Ciardullo 1986 170 p
Avail: Univ. Microfilms Order No. DA8614076

The morphological properties of rich supercluster 1451 + 22 are investigated using photographic galaxy photometry in a two color system especially sensitive to redshift. By measuring some 125,000 galaxies in five Palomar Schmidt fields, the supercluster's shape, density profile, density contrast, and galaxy population are found. The data suggest that the structure of 1451 + 22 is that of a face-on pancake, flattened against the plane of the sky, although spherical models are not ruled out. Filaments which are rich in early type galaxies do exist, but most of the mass of the supercluster lies outside these regions. In addition, 1451 + 22 seems to exhibit a core-halo structure, with the central degree containing a much higher galaxy density and a larger percentage of elliptical and SO galaxies than the outer regions. If 1451 + 22 is flat, the mean luminosity density contrast of the supercluster over the field is rho/rho sub field approx 10, and the total mass of the system probably M is greater than 10 to the 16th power solar masses. If the supercluster is quasi-spherical, the observed density contrast is rho/rho sub field approx 5, implying a total mass to light ratio of M/L solar luminosity approx.130, and a cosmological density parameter omega approx 0.3. Dissert. Abstr.

The 155-cm reflector was used for observations of comets and minor planets on 32 nights during April-October. The distribution was fairly uniform, ranging from 45 in June and September to 28 in July: on September 1 a total of 17 observations was made. A table is included which lists the 230 measurements published during the semester. These include six additional measurements going back to 1984 and the republication of a previously misidentified 1976 observation as a new discovery. Thirty-two of the observations refer to comets, 83 to numbered minor planets, and the remainder to unnumbered minor planets. Among the older-numbered minor planets observed were the Earth-approaching objects (3103) 1982 BB, (3199) 1982 RA (Nefertiti), (3361) 1982 HR and (3362) 1984 QA (Khufu), some of which were of interest for radar experiments. Unnumbered Earth-approaching objects observed were 1963 RH, 1983 RD, 1985 TB and 1986 DA, as well as the new discoveries 1986 JK, 1986 LA and 1986 PA. M.G.

CHROMOSPHERIC ACTIVITY OF COOL GIANT STARS Final Report
Thomas Y. Steiman-Cameron 23 Nov. 1986 9 p
(Grant NAG5-425)
(NASA-CR-177184; NAS 1.26:177184) Avail: NTIS HC A02/MF A01 CSCL 03B

During the seventh year of IUE twenty-six spectra of seventeen cool giant stars ranging in spectral type from K3 thru M6 were obtained. Together with spectra of fifteen stars observed during the sixth year of IUE, these low-resolution spectra have been used to: (1) examine chromospheric activity in the program stars and late type giants in general, and (2) evaluate the extent to which nonradiative heating affects the upper levels of cool giant photospheres. The stars observed in this study all have well determined TiO band strengths, angular diameters (determined from lunar occulations), bolometric fluxes, and effective temperatures. Chromospheric activity can therefore be related to effective temperatures providing a clearer picture of activity among cool giant stars than previously available. The stars observed are listed. NON-THERMAL RADIATION MECHANISMS AND PROCESSES IN SS 433 AND ACTIVE GALACTIC NUCLEI Ph.D. Thesis
David Louis Band 1985 307 p
Avail: Univ. Microfilms Order No. DA8602188

Studies of the jet emitting compact binary system SS 433 and the non-thermal synchrotron-self-Compton scattering process reveal features of the interaction of compact objects with their environments. The Einstein MPC X-ray observations of SS 433 are best fit by a non-thermal power law spectrum where both the intensity and (energy) spectral index varied on a timescale of hours to days. Flares characterized by an intensity increase and a hardening of the spectral index are attributed (within the context of the slaved disk model) to accretion surges that occur at certain orbital phases in a binary with a Roche-lobe filling primary whose spin axis is misaligned with the orbit axis. The synchrotron-self-Compton methodology in spherical geometries is refined, emphasizing both geometrical and spectral factors for both homogeneous and inhomogeneous sources. Electron and photon energy distribution cutoffs, as well as the high energy Klein-Nishina scattering cross-section, are considered in the spectral calculation. Physically reasonable variations on the standard model create observable breaks, spectral index changes, and peaks in the observed spectrum. Finally, the model of expanding sources (perhaps embedded in jets) is extended to include both continuous electron injection and inverse Compton X-ray production. Application of

this methodology to SS 433 suggests that the radio flares require additional electron injection into the expanding sources in the jets, while the X-ray emission cannot originate in these expanding sources. Analogous to the sources with radio quiet quasars, a self-consistent non-thermal source within the binary can satisfy observational constraints. Dissert. Abstr.

N87-12512 Cornell Univ., Ithaca, N.Y.
GALAXY GROUPS: NEUTRAL HYDROGEN AND DYNAMICS Ph.D. Thesis
Stephen Ewing Schneider 1986 213 p
Avail: Univ. Microfilms Order No. DA8607210

Observations of galaxies and intergalactic gas via the 21 cm line of neutral hydrogen are used to investigate the dynamics of galaxy groups. A study of 36 apparent groups observed at Arecibo demonstrates the variety of problems encountered when using galaxy redshifts to determine dynamical masses, and it is argued that inherent selection effects in such group samples prevent a meaningful interpretation of group dynamics. Fortuitously, a cloud-complex of intergalactic gas was discovered during the observations which allows a detailed dynamical study of the large-scale distribution of matter in the M96 group of galaxies. The intergalactic gas is distributed around the group's two central galaxies along a simple and uniquely-defined Keplerian orbit. This remarkable 200 kpc diameter ring of gas provides one of the only direct and well-constrained determinations of the mass of a group of galaxies away from any of the luminous matter in the group. From the modest mass-to-light ratio found, and from the structure of the orbit, it appears that any dark matter in the group is concentrated toward the individual galaxies. The intergalactic gas also provides a probe of the intergalactic environment away from the hot gas in galaxy clusters, and possible sub-thermal effects in diffuse intergalactic neutral hydrogen are considered. The internal dynamics of the intergalactic gas are examined in VLA observations, and the cloud gas is found to break up into clumps of gas that may be dynamically independent. Several scenarios for the origin and maintenance of the ring of intergalactic gas are considered, and the relationship of the gas to the surrounding galaxies is studied. Dissert. Abstr.

THE EMISSION LINES FROM ACCRETION DISKS IN CATACLYSMIC VARIABLE SYSTEMS Ph.D. Thesis
Frederic Victor Hessman 1985 406 p
Avail: Univ. Microfilms Order No. DA8609512

The line profiles and relative fluxes of the emission lines in the quiescent spectra of cataclysmic variables contain information about the physical state of the material in the accretion disks around the white dwarfs. Seven physical and phenomenological models for the emission line regions are discussed and the resulting emission line profiles and fluxes computed. The available observations are compared with detailed, theoretical, LTE accretion disks constructed using a wide variety of models for the viscosity. The structure of the optically thin parts of the disk is difficult to reconcile with that of simple disk models using heating due to viscous dissipation alone. H beta and H delta emission line profiles from Cassegrain spectra of SS Cygni have been deconvolved into radial emissivity distributions that are adequately characterized by a power-law in radius with an index of about-1.6. The excitation temperature measured by these Balmer lines is effectively constant over the entire disk. A detailed analysis of high resolution Coude observations indicates that the accretion disk line flux is modulated at high velocities in phase with the orbit. This extra emission can be adequately modeled by a sinusoidal variation in azimuth which is peaked towards the center of the disk. The impact of this model on the implied structure of the accretation disk and of the central star is discussed. Dissert. Abstr.

N87-12514 Maryland Univ., College Park.
THE PHYSICAL CHARACTERISTICS OF THE X-RAY EMITTING GAS IN CLUSTERS OF GALAXIES AND CONSTRAINTS ON DARK MATTER Ph.D. Thesis
Mark Jeffrey Henriksen 1985 216 p
Avail: Univ. Microfilms Order No. DA8608610

A model independent approach to the analysis of the X-ray emission from rich clusters of galaxies was formulated and applied to both spectral and imaging data. Temperature and density profiles are found which show, with 90% confidence, that the intracluster medium in many clusters is better fit by a nonisothermal equation of state than an isothermal one. This means that isothermal models are not adequate to describe the intracluster medium. More accurate abundances are determined for 10 clusters. As a result, weak evidence is found that hotter more evolved cluster have a lower iron abundance that cooler, less evolved ones. These results question the existing enrichment scenarios for the intracluster medium. Constraints are derived on the amount and distribution of mass which binds the gas. The centrally peaked X-ray emission observed in the X-ray images is successfully modeled by a Gaussian function added to a diffuse component. This analysis indicates that the luminosity in the central component was overestimated. The model advocated is able to derive all of the parameters which describe the intracluster medium in a self-consistent manner. Dissert. Abstr.

N87-12515 Cornell Univ., Ithaca, N.Y.
TOPICS IN THE THEORY OF NEUTRON STAR COOLING Ph.D. Thesis
Robert Clifton Duncan 1986 136 p
Avail: Univ. Microfilms Order No. DA8607319

The neutrino emissivity was calculated for interacting, degenerate quark matter, which may make up the dense cores of neutron stars. Quantum chromodynamic interactions between quarks are included to first order. Also considered, is the very early cooling epoch, lasting up to approximately 1 minute after formation, when a neutron star is optically thick to neutrons. The threshold color temperature of the emergent neutrino flux was determined. Estimates of the total mass loss from a hot neutron star which is cooling from an initially isothermal state were made. Implications of these results for Type II supernovae are briefly discussed. Dissert. Abstr.

NUMERICAL HYDRODYNAMIC MODELS OF PLANETARY NEBULAE Ph.D. Thesis
Matthew Simon Bobrowsky 1985 188 p
Avail: Univ. Microfilms Order No. DA8614202

Numerical models were calculated using the equations of mass, momentum, and energy conservation. The hydrodynamic equations are expressed in different form in order to facilitate numerical solution for the evolution of the gas. The dependent variables are defined at discrete points on a grid in the m-t plane (Lagrangian coordinates), in which the time steps are chosed to satisfy the Courant condition for numerical stability. Energy input is provided by photoionization of hydrogen and, in one case, a stellar wind, while cooling occurs mainly by de-excitation from excited electronic states of the more common ion. The models contain ionization and shock fronts depending on the various boundary conditions used. Dissert. Abstr.

N87-12518 Maryland Univ., College Park.
THE EARTH'S NUTATIONAL MOTION DETERMINED FROM RADIO INTERFEROMETRY Ph.D. Thesis
George Harry Kaplan 1985 224 p
Avail: Univ. Microfilms Order No. DA8614243

The connected-element radio interferometer at the National Radio Astronomy Observatory site at Green Bank, West Virginia, has been used since 1978 in a continuous program of astrometric observations. These observations have been used to obtain new information on the periodic motion of the Earth's rotation axis in inertial space. Observational determinations of this motion, referred to as astronomical nutation, provide information on the internal structure and dynamics of the Earth. Additionally, the reduction of various types of high-precision geodetic and astrometric data require that this motion be accurately known. A general description of various aspects of the Earth's rotation is given, and the basic physical origin of the nutational motion is developed. A discussion of the various effects which enter into highly accurate modern theories of this motion is given. The observing program and data reduction procedures are described. Finally, the results obtained are presented and their implications discussed. It is found that to the level of accuracy of the Green Bank data analyzed here, theories developed from modern Earth models adequately describe the nutational motion. Dissert. Abstr.

EXTENDED ATMOSPHERES OF OUTER PLANET SATELLITES AND COMETS Annual Report, 1 Aug. 1985 - 31 Jul. 1986
William H. Smyth and Michael R. Combi Sep. 1986 28 p (Contract NASw-3966)
(NASA-CR-176888; NAS 1.26:176888) Avail: NTIS HC A03/MF A01 CSCL 03B

An analysis of the extended atmospheres of outer planet satellites and comets is made. Primary emphasis is placed on cometary atmospheres because of the return of Comet P/Halley.

As part of a collaborative effort with A.I.F. Stewart, observations of the hydrogen coma of Comet P/Giacobini-Zinner obtained from the Pioneer Venus Orbiter ultraviolet spectrometer (PVOUVS) were successfully analyzed at AER and are reported. In addition, significant pre-modeling and post-modeling activities to support and analyze the PVOUVS observations of Comet P/Halley successfully acquired in late 1985 and early 1986 are also discussed. Progress in model preparation for third-year analysis of the Voyager UVS Lyman-alpha brightness distribution emitted by hydrogen atoms in the Saturn system is also summarized.

PIONEER 10 AND 11 (JUPITER AND SATURN) MAGNETIC FIELD EXPERIMENTS Final Report
Douglas E. Jones Oct. 1986 133 p
(Grant NAG2-145)
(NASA-CR-179856; NAS 1.26:179856) Avail: NTIS HC A07/MF A01 CSCL 03B

Magnet field data obtained by the vector helium magnetometer (VHM) during the encounters of Jupiter (Pioneer 10 and 11) and Saturn (Pioneer 11) was analyzed and interpreted. The puzzling characteristics of the Jovian and Saturnian magnetospheric magnetic fields were studied. An apparent substorm (including thinning of the dayside tail current sheet) was observed at Jupiter, as well as evidence suggesting that at the magnetopause the cusp is at an abnormally low latitude. The characteristics of Saturn's ring current as observed by Pioneer 11 were dramatically different from those suggested by the Voyager observations. Most importantly, very strong perturbations in the azimuthal ring current magnetic field suggest that the plane of the ring was not in the dipole equatorial plane, being tilted 5 to 10 deg relative to the dipole and undergoing significant changes during the encounter. When these changing currents were corrected for, an improved planetary field determination was obtained. In addition, the ring and azimuthal currents at Saturn displayed significantly different time dependences.

BASALT DEPTHS IN LUNAR BASINS USING IMPACT CRATERS AS STRATIGRAPHIC PROBES: EVALUATION OF A METHOD USING ORBITAL GEOCHEMICAL DATA Final Report
Constance G. Andre Oct. 1986 27 p
(Grant NAGw-444)
(NASA-CR-179858; NAS 1.26:179858) Avail: NTIS HC A03/MF A01 CSCL 03B

A rare look at the chemical composition of subsurface stratigraphy in lunar basins filled with mare basalt is possible at fresh impact craters. Mg/Al maps from orbital X-ray flourescence measurements of mare areas indicate chemical anomalies associated with materials ejected by large post-mare impacts. A method of constraining the wide-ranging estimates of mare basalt depths using the orbital MG/Al data is evaluated and the results are compared to those of investigators using different indirect methods. Chemical anomalies at impact craters within the maria indicate five locations where higher Mg/Al basalt compositions may have been excavated from beneath the surface layer. At eight other locations, low Mg/Al anomalies suggest that basin-floor material was ejected. In these two cases, the stratigraphic layers are interpreted to occur at depths less than the calculated maximum depth of excavation. In five other cases, there is no apparent chemical change between the crater and the surrounding mare surface. This suggests homogeneous basalt compositions that extend down to the depths sampled, i.e., no anorthositic material that might represent the basin floor was exposed. Author

SIMULTANEOUS SOLAR MAXIMUM MISSION (SMM) AND VERY LARGE ARRAY OBSERVATIONS OF SOLAR ACTIVE REGIONS Annual Report, 1 Sep. 1985 - 30 Oct. 1986
Kenneth R. Lang 30 Oct. 1986 158 p
(Grant NAG5-501)
(NASA-CR-177187; NAS 1.26:177187) Avail: NTIS HC A08/MF A01 CSCL 03B

The research deals mainly with Very Large Array and Solar Maximum Mission observations of the ubiquitous coronal loops that dominate the structure of the low corona. As illustrated, the observations of thermal cyclotron lines at microwave wavelengths provide a powerful new method of accurately specifying the coronal magnetic field strength. Processes are delineated that trigger solar eruptions from coronal loops, including preburst heating and the magnetic interaction of coronal loops. Evidence for coherent burst mechanisms is provided for both the Sun and nearby stars, while other observations suggest the presence of currents that may amplify the coronal magnetic field to unexpectedly high levels. The existence is reported of a new class of compact, variable moving sources in regions of apparently weak photospheric field. Author

LOW LEVEL DECIMETRIC (1.6 GHz) SOLAR BURST ACTIVITY
H. S. Sawant, J. E. R. Costa, R. H. Trevisan, C. J. B. Lattari, and P. Kaufmann Oct. 1986 23 p Submitted for publication
(INPE-4004-PRE/997) Avail: NTIS HC A02/MF A01

Observations of solar bursts were carried out in the month of July 1985 for about two weeks in R and L circular polarization with high sensitivity (0.01 s.f.u.) and high time resolution (3 msec) at 1.6 GHz, by using the 13.7 m Itapetinga antenna. Five intervals of solar burst activity, each one lasting for a couple of minutes, were observed and indicated a variety of decimetric bursts. Predominantly two classes of fast burst were observed: i.e., spike and blip. However, some of those bursts were two orders of magnitude less intense than those reported earlier. Detailed properties of all these bursts are presented. Low level blips have typical duration approx. 350 msec, excitation time approx. 130 + or - 25 msec, decay time approx. 200 + or - 25 msec and a low degree of circular polarization of about 15%. Investigation of these properties suggests that blips probably originate at second harmonic by beam plasma interaction. Also, low level ms-spikes with the half power duration in the range of 5 to 20 msec suggest that source sizes should be smaller than 50 Km and/or the bandwidth of emission should be 0.001%, if the process of emission is electron cyclotron maser. Author

RELATIVE TIMINGS OF MM-WAVES AND ASSOCIATED M-WAVES SOLAR BURSTS
H. S. Sawant, R. H. Trevisan, J. E. R. Costa, P. Zlobec, and M. Masserotti Oct. 1986 27 p Submitted for publication
(INPE-4013-PRE/1004) Avail: NTIS HC A03/MF A01

Observations of type III bursts (starting frequencies 237 to 408 MHz) and meter-wave narrowband fine time (approx. 300 msec) structures obtained with high sensitivity and high time resolution were compared with millimeter (22 GHz) wavelength bursts obtained simultaneously. For the major time structure (approx. 1 sec) the differences observed in the peak time of the type III burst and the associated mm -lambda emission are in the range of + or - 1 sec. In most cases, the type III burst peaked later by approx. 500 msec compared to the associated mm-lambda bursts. These observed time delays, along with the starting frequency (237 MHz) of the type III bursts suggest that the type III emission should be at the fundamental. Acceleration of the electrons should be time dependent and the acceleration region should be located where the electron density is approx. 10 to the 9th power/cu cm. Narrowband m-lambda fine structures with duration up to approx. 200 msec were found to be often associated with mm-lambda time structures, and the difference in their peak times was about + or - 150 msec on the average. Also in most cases, the peaks of narrowband m-lambda fine time structures led the associated mm-lambda time structures by approx. 150 msec. These observed time differences are three times smaller than those observed in the case of the type III bursts and in majority of cases, of opposite sign. These average small differences and their sign can be accounted for, if the narrowband m-lambda fine structures are assumed to be due to processes of secondary acceleration, and source of acceleration region should be near the region where m-lambda fine structure is produced. VOYAGER MICROWAVE SCINTILLATION MEASUREMENTS OF SOLAR WIND PLASMA PARAMETERS Ph.D. Thesis
Jan Morris Martin 1985 206 p
Avail: Univ. Microfilms Order No. DA8602508

During the solar conjunctions of Voyager 1 and 2 spacecraft in August 1979, September 1980, and November 1982, temporal variations of intensity and frequency of the dual-wavelength (3.6 and 13 cm) radio transmissions from the spacecraft were observed and subsequently analyzed to infer characteristics of the solar wind plasma flow. Measurements of the temporal wave structure function were used to estimate the spectral index of the power law spatial spectrum of irregularities. Theoretical intensity scintillation spectra were compared with measured intensity spectra to obtain least-squares estimates of: (1) mean velocity, (2) random velocity, (3) axial ratio, and (4) electron density standard deviation. Uncertainties in parameter estimates were calculated by standard propagation of errors techniques. Several conclusions may be drawn from these scintillation measurements: (1) the lack of

latitudinal variation of density fluctuations and mean velocity is consistent with the shrinkage or disappearance of the north polar coronal hole in 1979-80 (the latitudinal variation observed in density fluctuations in 1982 confirm the hole reappearance); (2) simultaneous intensity and phase scintillation spectra provide strong evidence that the underlying spatial spectrum of density fluctuations is not Gaussian (the results are consistent with a power law spatial spectrum); (3) measured density fluctuations at 10 solar radii are consistent with fast-mode wave theory of solar wind heating, but at 20 solar radii measured values are 2 to 5 times theoretical values. Dissert. Abstr.

N87-12527 Colorado Univ., Boulder.
LARGE-SCALE STRUCTURE AND DYNAMICS OF SOLAR ACTIVE REGIONS OBSERVED IN THE FAR ULTRAVIOLET Ph.D. Thesis
James Andrew Klimchuk 1985 210 p
Avail: Univ. Microfilms Order No. DA8608618

In this thesis high resolution Dopplergrams in CIV (1548) are examined for the purpose of understanding the large scale dynamics of solar active regions and the closely related problem of magnetic structure. The Dopplergrams are compared with photospheric magnetograms and H sub alpha filtergrams in order to determine the relationship of the flows to the overall magnetic field topology. These observations sample three different heights in the atmosphere and can potentially be used to map the field from the photosphere up through the transition region. Vector properties of the flow and field are inferred from center-to-limb variations in the measured Doppler shift and longitudinal field component. It was found that spatial correlations between features seen in Dopplegrams, magnetograms, and filtergrams are quite close, and that active regions can be naturally divided into three basic parts; strong field regions, weak field corridors between opposite polarities, and surrounding weak field areas. Sizable uncertainties in the Dopplergram interpretation have prevented the description of the transition region flows unambiguously. Two possible scenarios that are consistent with the data are identified. In the most likely of the two, the flows vanish within corridors and surrounding areas, and they produce constant (across the disk) absolute red shifts of about 18 km/s within strong field regions. Dissert. Abstr.

N87-12528 Maryland Univ., College Park.
GAMMA RAYS AND NEUTRONS FROM SOLAR FLARES Ph.D. Thesis
Ronald James Murphy 1985 224 p
Avail: Univ. Microfilms Order No. DA8614259

Recent observations with the Gamma-Ray Spectrometer (GRS) on the Solar Maximum Mission (SMM), along with observations from a number of ground-based and spacecraft detectors, contain a wealth of information on particle acceleration in solar flares. The analysis and interpretation of this data is crucial to the understanding of the flare process. A general analysis of gamma-ray and neutron production in solar flared and a comparison of theoretical calculations with data are presented. An overview of the flare phenomenon is given, recent gamma-ray and particle observations are discussed, the theory of each production process is reviewed and detailed calculations are presented, and a comparison of these calculations with data is made. Dissert. Abstr.

HIGH ENERGY NEUTRINO EMISSION FROM BINARY X-RAY SOURCES
G. Auriemma, H. Bilokon, and A. F. Grillo 23 Jul. 1985 10 p
Presented at 1st Symposium on Underground Physics, St. Vincent, Italy, 25-28 Apr. 1985
(Preprint-471; ETN-86-97906) Avail: NTIS HC A02/MF A01

The production of high energy neutrinos associated with the gamma-ray production in Cyg X3, Vela X1, and LMC X4 X-ray sources is discussed. It is shown that based on the observational parameters of the binary systems, the time average of the ratio of the neutrino luminosity to gamma-ray luminosity is 30. The neutrino flux is modulated with the orbital period of the system and the neutrino light curve is determined by the density profile of the companion star. The X-ray binaries can be both ultrahigh energy gamma-ray and neutrino emitters with a neutrino luminosity comparable to their X-ray luminosity. The brightest of these could be detected by neutrino telescopes such as DUMAND and MACRO. ESA

The mission of the NASA Langley Research Center is to increase the knowledge and capability of the United States in a full range of aeronautics disciplines and in selected space disciplines. This mission will be accomplished by: performing innovative research relevant to national needs and Agency goals; transferring technology to users in a timely manner; and providing development support to other United States Government agencies, industry, and the NASA centers. This report contains highlights of the major accomplishments and applications made during the past year. The highlights illustrate both the broad range of the research and technology activities at the NASA Langley Research Center and the contributions of this work toward maintaining United States leadership in aeronautics and space research. Typical Subject Index Listing

The subject heading is the key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension has been added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The NASA accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus* (NASA SP-7053).

Alternator-driven, magnetically switched modulator
[DE86-012189] N87-11949
ACCELERATION TOLERANCE
Tolerance to +Gz accelerations of individuals of different ages other than pilots N87-12130
ACCELEROMETERS
Theoretical and experimental investigations of sensor location for optimal aeroelastic system state estimation N87-11794
ACCEPTABILITY
Acceptance criteria for welds in ASTM A106 grade B steel pipe and plate
[NASA-TM-89052] N87-11874
ACCESS CONTROL
METEOSAT raw image data encryption
[ESA-CR(P)-2234] N87-11932
ACCIDENT INVESTIGATION
Delta launch vehicle accident investigation
[GPO-63-141] N87-11820
ACCIDENTS
Delta launch vehicle accident investigation
[GPO-63-141] N87-11820
Investigation of the Challenger accident
[H-REPT-99-1016] N87-11824
Hearings before the Subcommittee on Space Science and Applications of the Committee on Science and Technology, 99th Congress, 2nd Session, No. 132, 25, 27 February; 11, 13, 20 March; 9, 10 April, 1986, Volume 2
[GPO-61-777] N87-12402
ACCRETION DISKS
Jets, mass outflows and disks associated with young stellar objects N87-12486
Planetary optical and infrared imaging N87-12487
The emission lines from accretion disks in cataclysmic variable systems N87-12513
The evolution of active galactic nuclei N87-12516
ACID BASE EQUILIBRIUM
Use of gas mixtures with high oxygen and carbon dioxide content to normalize external respiration and blood acid-base equilibrium in presence of muscle fatigue N87-12132
ACID RAIN
Investigation on acidity-forming ions in wet and dry deposition during the winter season 1984/85
[DFVLR-FB-86-15] N87-12062
ACIDOSIS
Skeletal muscle fatigue: Physiological and biochemical studies N87-12159
ACOUSTIC DUCTS
Numerical study of the damping of acoustic waves in a duct with splitter plates
[MPIS-20/1985] N87-12324
ACOUSTIC PROPAGATION
Two methods for calculating acoustic wave propagation through an interface — noise reduction
[ESA-TT-955] N87-12325
ACOUSTIC PROPERTIES
Window acoustic study for advanced turboprop aircraft
[NASA-CR-172391] N87-12322
Lightweight sidewalls for aircraft interior noise control
[NASA-CR-172490] N87-12323
ACQUISITION
System safety procedures for nondevelopment item (NDI) acquisitions
[AD-A168353] N87-12012
ACTIVATION ANALYSIS
Topical Meeting on Microphysics of Surfaces, Beams and Adsorbates held at Santa Fe, New Mexico on 4 - 6 February 1985
[AD-A168618] N87-12364
ACTIVE CONTROL
Application of optimization techniques to the design of a flutter suppression control law for the DAST ARW-2 N87-11736
Active control of robot manipulator compliance
[NASA-CR-177183] N87-11994
ACTIVITY (BIOLOGY)
Functional state of somatotropic cells of adenohypophysis in hypokinetic rats N87-12140
ACTUATORS
Large wheel actuators definition study — spacecraft control
[TELDIX-15-020-880] N87-11834
A hardware processor for a missing energy trigger
[PREPRINT-468] N87-12336
ADA (PROGRAMMING LANGUAGE)
The implementation and use of Ada on distributed systems with high reliability requirements
[NASA-CR-179806] N87-12243
Using off the shelf code generators in the Delft Ada Subset (DAS) compiler: Some experiences
[REPT-85-37] N87-12263
The implementation and use of Ada on distributed systems with high reliability requirements
[NASA-CR-179842] N87-12265
ADAPTATION
Philosophical aspects of adaptation theory N87-12106
Venous pressure in jugular vein system and effectiveness of blood return to right heart during 120-day head-down tilt N87-12111
ADAPTIVE CONTROL
Methods for assessing wall interference in the 2- by 2-foot adaptive-wall wind tunnel
[NASA-TM-88252] N87-11800
Definition, study and design of a specific self-checking microprocessor COBRA
[ETN-86-98402] N87-12173
ADDITIVES
Density of states due to pairing of impurities in semiconductor systems
[INPE-4009-PRE/1001] N87-12358
ADENOSINE TRIPHOSPHATE
Norepinephrine used to control energy of heat production and utilization of ATP in single muscular contraction under normal and hyperoxic conditions N87-12141
In vivo nuclear magnetic resonance imaging
[NASA-CR-179902] N87-12328
ADHESION
Modeling of infiltration kinetics and interfacial bond strength in aluminum matrix-silicon carbide composites
[AD-A170480] N87-11853
ADIABATIC EQUATIONS
Application of satellite data to the variational analysis of the three dimensional wind field
[NASA-CR-4022] N87-12084
ADSORPTION
Topical Meeting on Microphysics of Surfaces, Beams and Adsorbates held at Santa Fe, New Mexico on 4 - 6 February 1985
[AD-A168618] N87-12364
Surface vibrations and (2x1) superstructures on FCC(110) metal surfaces
[AD-A168788] N87-12367
AERIAL PHOTOGRAPHY
Research in expert interactive cartographic systems
[AD-A168337] N87-12041
AERODYNAMIC BALANCE
The 8 m x 6 m low speed wind tunnel at the Chinese Aerodynamic Research and Development Center
[AD-A168448] N87-11803
AERODYNAMIC CHARACTERISTICS
Acta Aerodynamica Sinica (selected articles)
[AD-A168449] N87-11684
An experimental study of the aerodynamics of a NACA 0012 airfoil with a simulated glaze ice accretion
[NASA-CR-179697] N87-11701
The 8 m x 6 m low speed wind tunnel at the Chinese Aerodynamic Research and Development Center
[AD-A168448] N87-11803
AERODYNAMIC CONFIGURATIONS
Forward-swept wing configuration designed for high maneuverability by use of a transonic computational method
[NASA-TP-2628] N87-11702
AERODYNAMIC DRAG
Drag and pressure recovery characteristics of auxiliary air inlets at subsonic speeds
[ESDU-86002] N87-11692
AERODYNAMIC FORCES
Research on an aerodynamic particle separator (the EPS)
[UTIAS-316] N87-11963
AERODYNAMIC HEATING
Discussion of the effect of temperature on the very short term properties of metals and alloys — high speed flight
[BAE-BT-14842] N87-11882
AERODYNAMIC INTERFERENCE
Methods for assessing wall interference in the 2- by 2-foot adaptive-wall wind tunnel
[NASA-TM-88252] N87-11800

SUBJECT

AERODYNAMIC LOADS
Normal force, pitching moment and side force of asymmetric forebody-cylinder combinations for angles of attack up to 90 degrees and Mach numbers up to 1.2
[ESDU-86009] N87-11690
AERODYNAMIC STABILITY
Vortex flap technology: A stability and control assessment
[NASA-CR-172439] N87-11795
AERODYNAMICS
Investigation of the external flow analysis for density measurements at high altitude
[NASA-CR-172464] N87-11693
Contribution to the analysis of high-lift airfoil aerodynamics
[AD-A168401] N87-11703
Applications of CONMIN to wing design optimization with vortex flow effect N87-11737
Sensitivity analysis in computational aerodynamics N87-11742
Aircraft configuration optimization including optimized flight profiles N87-11743
Aeroelastic-aerodynamic optimization of high speed helicopter-compound rotor N87-11758
AEROELASTIC RESEARCH WINGS
Theoretical and experimental investigations of sensor location for optimal aeroelastic system state estimation N87-11794
AEROELASTICITY
Calculated effects of varying Reynolds Number and dynamic pressure on flexible wings at transonic speeds N87-11738
Some experiences in aircraft aeroelastic design using Preliminary Aeroelastic Design of Structures (PAD) N87-11747
On sound propagation in centrifugal fan casings
[ESA-TT-957] N87-12326
AERONAUTICAL ENGINEERING
A research planning assessment for applications of artificial intelligence in manufacturing
[AD-A168602] N87-12252
AEROSOLS
A comparison of Stratospheric Aerosol and Gas Experiment 1 (SAGE 1) and Umkehr ozone profiles including a search for Umkehr aerosol effects N87-12066
Project CONDORS: Convective diffusion observed by remote sensors
[PB86-222221] N87-12079
Analyses of the atmospheric aerosol extinction in the 0.5 to 14 micron region
[FOA-C-30396-E1,E3] N87-12091
Detection, identification, and settling of bacteria from an aerosol; testing of a detector for aerosols with bacteria and preliminary investigation of settling on different surface materials
[FOA-C-40229-B2] N87-12103
AEROSPACE ENGINEERING
USSR report: Space
[JPRS-USP-86-005] N87-11809
Discussion of the effect of temperature on the very short term properties of metals and alloys — high speed flight
[SAE-ST-14842] N87-11882
Research and technology, 1986
[NASA-TM-89037] N87-12531
AEROSPACE ENVIRONMENTS
A solid state data recorder for space-based applications using magnetic bubble memory
[AD-A168909] N87-11984
AEROSPACE MEDICINE
Interview on medical program of 237-day flight N87-11814
USSR report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, March - April 1986
[JPRS-USB-86-004] N87-12105
Mathematical models of fluid-electrolyte metabolism N87-12106
Preliminary results of medical investigations during 6-month spaceflight aboard Salyut-7-Soyuz-T orbital complex N87-12109
USSR report: Space Biology and Aerospace Medicine, vol. 20, no. 4, July - August 1986
[JPRS-USB-86-006] N87-12124
Problems of aviation and space medicine, biology and psychology discussed at fifteenth Gagarin Scientific Lectures N87-12148
Development of vision tests for air-to-air target detection
[AD-A168309] N87-12161
AEROSPACE SCIENCES
Research and technology
[NASA-TM-89052] N87-12530
AEROSPACE SYSTEMS
The implementation and use of Ada on distributed systems with high reliability requirements
[NASA-CR-179606] N87-12243
AFTERBURNING
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A168450] N87-11885
AGE FACTOR
Tolerance to +Gz accelerations of individuals of different ages other than pilots N87-12130
AH-64 HELICOPTER
Optimization process in helicopter design N87-11726
AIR
Hydrogen: Air steam flammability limits and combustion characteristics at intermediate scale
[TIS6-009661] N87-11871
AIR COOLING
Fabrication of cooled radial turbine rotor
[NASA-CR-179503] N87-11759
AIR DEFENSE
Development of vision tests for air-to-air target detection
[AD-A168309] N87-12161
AIR FLOW
Calculation of water drop trajectories to and about arbitrary three-dimensional lifting and nonlifting bodies in potential airflow
[NASA-CR-3935] N87-11894
AIR POLLUTION
Derivation of damage functions for atmospheric degradation of materials
[PB86-213238] N87-11911
Investigation on acidity-forming ions in wet and dry deposition during the winter season 1984/85
[DFVLR-FB-86-15] N87-12062
Terrain classification for regional transport models
[KNMI-TR-81(FM)] N87-12063
Study using a three-dimensional smog formation model under conditions of complex flow
[PB86-213248] N87-12080
Evaluation of method for collecting and concentrating organic trace impurities in air N87-12145
Carbon dioxide increase and human health: Data and research requirements for determining consequences (including a bibliography for additional reading)
[DE86-012760] N87-12186
AIR TRAFFIC CONTROL
Runway incursions at controlled airports in the United States
[PB86-917003] N87-11711
Mode S beacon system: Functional description
[DOT/FAA/PM-86/19] N87-11715
AIR TRAFFIC CONTROLLERS (PERSONNEL)
Biochemical indicators of emotional stress in air traffic controllers N87-12129
Biological rhythms and rotating shift work: Some considerations for air traffic controllers and managers
[AD-A168742] N87-12153
AIR WATER INTERACTIONS
Equatorial Pacific Ocean Climate Studies (EPOCS): Progress and plans
[PB86-213493] N87-12092
AIRBORNE INFECTION
Sanitary and microbiological aspects of closed environment occupied by people and animals N87-12121
AIRCRAFT ACCIDENT INVESTIGATION
Aircraft accident reports: Brief format, US civil and foreign aviation, issue number 5 of 1985 accidents
[PB86-916919] N87-11710
AIRCRAFT ACCIDENTS
Aircraft accident reports: Brief format, US civil and foreign aviation, issue number 4 of 1985 accidents
[PB86-916918] N87-11712
Aircraft accident reports: Brief format, US civil and foreign aviation, issue number 3 of 1985 accidents
[PB86-916917] N87-11713
Review of accident data: US general aviation calendar year 1982
[PB86-201910] N87-11714
AIRCRAFT APPROACH SPACING
Runway incursions at controlled airports in the United States
[PB86-917003] N87-11711
AIRCRAFT COMPARTMENTS
Mathematical model of human kinematic reactions to impacts N87-12130
AIRCRAFT CONFIGURATIONS
Experiences performing conceptual design optimization of transport aircraft N87-11723
PIAS: A program for an iterative aeroelastic solution N87-11725
Helicopter rotor blade aerodynamic optimization by mathematical programming N87-11753
AIRCRAFT CONSTRUCTION MATERIALS
Automated tape laying machine for composite structures
[AD-D012366] N87-11851
AIRCRAFT CONTROL
Tradeoff methods in multiobjective insensitive design of airplane control systems N87-11730
Application of optimization techniques to the design of a flutter suppression control law for the DAST ARW-2 N87-11736
The implementation and use of Ada on distributed systems with high reliability requirements
[NASA-CR-179642] N87-12265
AIRCRAFT DESIGN
Recent Experiences in Multidisciplinary Analysis and Optimization, part 1
[NASA-CP-2327-PT-1] N87-11717
Optimization in the systems engineering process N87-11719
Practical considerations in aeroelastic design N87-11720
Flutter optimization in fighter aircraft design N87-11721
Application of the generalized reduced gradient method to conceptual aircraft design N87-11722
Experiences performing conceptual design optimization of transport aircraft N87-11723
PIAS: A program for an iterative aeroelastic solution N87-11725
Optimization process in helicopter design N87-11726
Sizing-stiffened composite panels loaded in the postbuckling range N87-11733
Application of optimization techniques to the design of a flutter suppression control law for the DAST ARW-2 N87-11736
Applications of CONMIN to wing design optimization with vortex flow effect N87-11737
Influence of analysis and design models on minimum weight design N87-11739
Multidisciplinary systems optimization by linear decomposition N87-11740
Aircraft configuration optimization including optimized flight profiles N87-11743
Multidisciplinary optimization applied to a transport aircraft N87-11746
Some experiences in aircraft aeroelastic design using Preliminary Aeroelastic Design of Structures (PAD) N87-11747
Design enhancement tools in MSC/NASTRAN N87-11748
The automated strength-aeroelastic design o aerospace structures program N87-11749
Recent Experiences in Multidisciplinary Analysis an Optimization, part 2
[NASA-CP-2327-PT-2] N87-11751
Comments on gust response constrained optimization N87-1177
Applying optimization software libraries to engineering problems N87-1177
Design of a takeoff performance monitoring system N87-1178
National aeronautical R and D goals: Technology fo America's future
[PB86-209772] N87-1240
AIRCRAFT ENGINES
STAEBL: Structural tailoring of engine blades, phase N87-1173
Optimization applications in aircraft engine design an test N87-1176
Control of gas turbines. The future: Is a radical approac needed? — aircraft engines
[PNR-90286] N87-1175
Carburizing steel for high temperature service
[AD-A168327] N87-1181
AIRCRAFT EQUIPMENT
Carburizing steel for high temperature service
[AD-A168327] N87-1181
AIRCRAFT FUELS
Antimisting kerosene: Evaluation of low temperatu performance
[DOT/FAA/CT-85/31] N87-1198
Aviation turbine fuels, 1985
[DE86-012140] N87-1198
AIRCRAFT HAZARDS
Atmospheric electrical modeling in support of the NA F106 Storm Hazards Project
[NASA-CR-179601] N87-120
AIRCRAFT INSTRUMENTS
Distinctions of visual monitoring of instrument readin in maneuvered flight N87-121
AIRCRAFT LANDING
Electroluminescent (EL) remotely-controlled landi zone marker light system
[AD-D012366] N87-117
AIRCRAFT NOISE
Lightweight sidewalls for aircraft interior noise con
[NASA-CR-172490] N87-12
On sound propagation in centrifugal fan casings
[ESA-TT-957] N87-12

Introduction to helicopter noise
[ISL-NB-401/84] N87-12327

AIRCRAFT PERFORMANCE
Flight test report of the NASA icing research airplane: Performance, stability, and control after flight through natural icing conditions
[NASA-CR-179615] N87-11797

AIRCRAFT PILOTS
An application of multidimensional scaling to describe stress among naval helicopter pilots
[AD-A168367] N87-12162

AIRCRAFT SAFETY
National Transportation Safety Board safety recommendation N87-11708
Aircraft accident reports: Brief format, US civil and foreign aviation, issue number 5 of 1985 accidents
[PB86-916919] N87-11710
Flight test report of the NASA icing research airplane: Performance, stability, and control after flight through natural icing conditions
[NASA-CR-179615] N87-11797

AIRCRAFT STABILITY
Application of modern structural optimization to vibration reduction in rotorcraft N87-11752

AIRCRAFT STRUCTURES
Flutter optimization in fighter aircraft design N87-11721
Sizing-stiffened composite panels loaded in the postbuckling range N87-11733
Comments on gust response constrained optimization N87-11774

AIRCRAFT SURVIVABILITY
Crash dynamics program transport seat performance and cost benefit study
[DOT/FAA/CT-85/38] N87-11708

AIRCRAFT TIRES
Vertical deflection characteristics of aircraft tyres
[ESDU-86005] N87-11992

AIRFOIL PROFILES
Vortex shedding of a square cylinder in front of a slender airfoil at high Reynolds numbers. Part 2: Compressibility effect
[MPIS-24/1985] N87-11704

AIRFOILS
Acta Aerodynamica Sinica (selected articles)
[AD-A168449] N87-11984
An experimental study of the aerodynamics of a NACA 0012 airfoil with a simulated glaze ice accretion
[NASA-CR-179697] N87-11701
Contribution to the analysis of high-lift airfoil aerodynamics
[AD-A168401] N87-11703

AIRLINE OPERATIONS
Systems, avionics and instrumentation of transport category helicopters
[NLR-MP-85066-U] N87-11785

AIRPORTS
Runway incursions at controlled airports in the United States
[PB86-917003] N87-11711
Advanced construction procedures: Confined bases for airport pavements
[FAA/PM-86/9] N87-11799
Number and duration of Runway Visual Range (RVR) runs for RVR-values lower than 225 m
[KNMI-TR-85(FM)] N87-11905

ALASKA
An ecologic study of peat landforms in Canada and Alaska
[NASA-CR-179740] N87-12033
Thematic mapper study of Alaskan ophiolites
[NASA-CR-179729] N87-12035

ALBEDO
Asteroid team N87-12480

ALGEBRA
Error estimates for differential-algebraic equations
[DE86-012492] N87-12291

ALGORITHMS
Design of a takeoff performance monitoring system N87-11787
A class of stable transmission algorithms for varying user models
[AD-A168701] N87-11923
A multilayer channel router for nonrectangular channels — wiring
[INF-86-9] N87-11957
Some implications of dynamic structural analysis N87-12176
An adaptive subdivision by sliding boundary surfaces for fast ray tracing N87-12182
Using caching and breadth-first search to speed up ray-tracing N87-12184
A fast algorithm for general raster rotation N87-12198
The stochastic modelling of trees N87-12201
Hardware assistance for Z-buffer visible surface algorithms N87-12205
Keyframe-based subactors N87-12208
Interfacing image processing and computer graphics systems using an artificial visual system N87-12210
Connected component labeling using modified linear quadtrees N87-12211
ASTERISK: An extensible testbed for spline development N87-12212
Mathematical morphology applied to range image processing N87-12222
Selection and use of image features for segmentation of boundary images N87-12226
Generalized network implementations
[AD-A168298] N87-12266
Systolic array synthesis: Computability and time cones
[AD-A168697] N87-12267
Reconstruction of two-dimensional signals from the Fourier transform magnitude
[AD-A168792] N87-12269
Approximate counting. A Martingale approach
[AD-A170229] N87-12290
A strongly polynomial algorithm for minimum cost submodular flow problems
[PREPRINT-102] N87-12293
Contribution to the study of nonconvex nondifferentiable optimization algorithms
[ETN-86-99403] N87-12296
Development of algorithms and hardware for structured-light vision
[AD-A168197] N87-12338
Computing covers for embedded functional dependencies — data base management
[REPT-86-006] N87-12393

ALKALI METALS
A study of laser induced ionization of alkali metal vapours based on saturation of the first resonance transition
[UTIS-299] N87-11987

ALKANES
Heat capacity and enthalpy of liquids: Alkanes
[ESDU-86007] N87-12377

ALLOYS
Discussion of the effect of temperature on the very short term properties of metals and alloys — high speed flight
[SAE-ST-14842] N87-11882

ALTITUDE ACCLIMATIZATION
Distinctions of capillarization of white rat skeletal muscle during adaptation to high altitude of the Pamirs and Antarctica N87-12117

ALTITUDE TESTS
A study in the variation in atmospheric transmission of different temperature blackbody sources in the 3.85 - 4.85 micron waveband
[SAE-ST-16206] N87-12078

ALUMINATES
Research on materials related to the sodium heat engine
[DE86-012833] N87-12004

ALUMINUM
Size distribution of unburned aluminum particles in solid propellant rocket motor exhaust
[DE86-013376] N87-11840
Impact and residual fatigue behavior of ARALL and AS6/5245 composite materials
[NASA-TM-89013] N87-11848
Inertial welding of 1100 aluminum to type 316 stainless steel
[DE86-009145] N87-11996
Simulation studies for surfaces and materials strength
[NASA-CR-177046] N87-12357

ALUMINUM ALLOYS
The elastic constants of NiAl to 1.4 GPa
[AD-A168813] N87-11679
Performance limits of surface-hardened aluminum-alloy gears in vacuum
[ESA-ESTL-089] N87-11864

ALUMINUM GALLIUM ARSENIDES
High energy electron radiation degradation of gallium arsenide solar cells
[AD-A168402] N87-12050
Deep-level transient spectroscopy studies of gallium arsenide - aluminum gallium arsenide heterostructures and superlattices
[AD-A168328] N87-12361

AMAZON REGION (SOUTH AMERICA)
A study of the radiation balance of the Amazon Forest
[INPE-3958-PRE/974] N87-12061

AMBIENT TEMPERATURE
Mechanical properties of various alloys in hydrogen
[NASA-CR-179874] N87-11889

AMINO ACIDS
Human blood free amino acids at early stage of head-down tilt N87-12113

AMORPHOUS MATERIALS
Density of states at mid gap in hydrogenated amorphous silicon
[DE86-011403] N87-12373

AMORPHOUS SEMICONDUCTORS
Preparation and investigation of amorphous gallium arsenide films
[AD-A168907] N87-12369

AMPTE (SATELLITES)
Plasma waves associated with the first AMPTE magnetotail barium release
[AD-A170277] N87-12075

ANALYSIS (MATHEMATICS)
Mathematical and statistical analysis
[AD-A169277] N87-11830
Systolic array synthesis: Computability and time cones
[AD-A168697] N87-12267

ANALYTIC FUNCTIONS
Analytic solutions of the nonlinear partial differential equations for transonic flow in physical spaces
[DFVLR-FB-86-14] N87-11705

ANGLE OF ATTACK
Contribution to the analysis of high-lift airfoil aerodynamics
[AD-A168401] N87-11703

ANGULAR ACCELERATION
Linear and rotational acceleration of a 3D rigid body
[MED-INFO-SHEET-715] N87-12319

ANGULAR VELOCITY
Motion characteristics of the UTIAS flight research simulator motion-base
[UTIAS-TN-261] N87-11802

ANHYDRIDES
Polyimides containing oxyethylene units. Part 4: Polymerization of dianhydrides containing ether linkages
[NASA-TM-89257] N87-11891

ANIONS
Reductive disproportionation of carbon dioxide by dianionic carbonylmetalates of the transition metals
[AD-A168211] N87-11859

ANNIHILATION REACTIONS
Relevance at an intermediate-range force for neutron-antineutron oscillation experiments
[NOTA-INTERNA-864] N87-12330

ANOMALIES
Clear air turbulence analysis using isentropic methods
[AD-A168400] N87-12088
Equatorial Pacific Ocean Climate Studies (EPOCS): Progress and plans
[PB86-213493] N87-12092
On the quantization of anomalous theories — gauge theory
[PREPRINT-473] N87-12321

ANTARCTIC REGIONS
Antarctic meteorite newsletter, volume 9, number 1
[NASA-TM-89230] N87-12508

ANTENNA ARRAYS
Simultaneous Solar Maximum Mission (SMM) and very large array observations of solar active regions
[NASA-CR-177187] N87-12522

ANTENNAS
Design optimization of the 34-meter DSN-NCP antennas N87-11783

ANTHROPOMETRY
Animating human figures: Perspectives and directions N87-12194
Computer aided design using anthropometry: A strategy
[BAE-HC/CAD/84-1] N87-12257

ANTIFRICTION BEARINGS
Selection of rolling-element bearing steels for long-life application
[NASA-TM-88881] N87-11993

ANTIGENS
Stress and neuroendocrine regulation of immune responses
[AD-A168768] N87-12155

ANTIMISSILE DEFENSE
SDI (Strategic Defense Initiative) Program: Evaluation of DOE's (Department of Energy's) answers to questions on X-ray laser experiment, briefing report
[PB86-209236] N87-11808

ANTIMISTING FUELS
Antimisting kerosene: Evaluation of low temperature performance
[DOT/FAA/CT-85/31] N87-11902

ANTINEUTRINOS
Relevance at an intermediate-range force for neutron-antineutron oscillation experiments
[NOTA-INTERNA-864] N87-12330

ANTIREFLECTION COATINGS
Nuclear hardening of optical coatings: Enhanced energy sharing concept, revision 1
[DE86-009726] N87-11831

ANVIL CLOUDS
Data processing and case study analysis of thunderstorm studies
[NASA-CR-179690] N87-12083
APERTURES
Large optics technology
[AD-A168222] N87-12339
APOLLO SPACECRAFT
Multidisciplinary approach to the design of high pressure oxygen systems N87-11780
APPLICATIONS PROGRAMS (COMPUTERS)
Investigation of the external flow analysis for density measurements at high altitude
[NASA-CR-172464] N87-11693
Design of a takeoff performance monitoring system N87-11787
HALOE science investigation
[NASA-CR-179825] N87-11857
Application of computer techniques in the prediction of inorganic compounds
[PB86-205762] N87-11870
LANDSAT-D program. Volume 2: Ground segment
[NASA-CR-177174] N87-12030
SMP: A solid modeling program version 2.0
[NASA-CR-178183] N87-12244
APPROPRIATIONS
Authorization of appropriations for the National Aeronautics and Space Administration for Fiscal Year 1987
[S-REPT-99-501] N87-12400
Making appropriations for the Department of Housing and Urban Development and for sundry independent agencies, boards, commissions, corporations and offices for the fiscal year ending September 30, 1987
[GPO-84-330] N87-12401
APPROXIMATION
Sensitivity analysis and approximation methods for general eigenvalue problems
[NASA-CR-179538] N87-12021
Near-optimal starting solution for polynomial approximation of a continuous function in the L sub 1 norm
[PB86-215183] N87-12300
Evaluation of L sub 1 codes using polynomial approximation problems
[PB86-215175] N87-12301
APTITUDE
Extended analysis of the structure of error scores in psychological aptitude tests
[ESA-TT-943] N87-12163
AQUATIC PLANTS
Teledetection by aquatic plants. Investigation of the possibilities of multispectral photography and spectroradiometry
[VLT-1985-11] N87-12045
ARC WELDING
Reliable welding of HSLA steels by square wave pulsing using an advanced sensing (EDAP) technique
[AD-A168762] N87-11997
Electrochemical effects on weld pool chemistry in submerged arc and dc electroslag welding
[DE86-012117] N87-12003
ARCHITECTURE (COMPUTERS)
The application of a sparse, distributed memory to the detection, identification and manipulation of physical objects
[NASA-TM-89231] N87-12169
Multiple task oriented processor
[AD-D012392] N87-12170
An adaptive subdivision by sliding boundary surfaces for fast ray tracing N87-12182
An editing model for generating graphical user interfaces N87-12186
A network architecture for data-driven systems
[AD-A168764] N87-12267
Systolic array synthesis: Computability and time cones
[AD-A168697] N87-12287
ARCTIC REGIONS
Arctic communications techniques: Remote unattended power systems
[AD-A168269] N87-11918
ARM (ANATOMY)
Slowly-developing modifications in cutaneous circulatory control
[AD-A168702] N87-12152
ARRAYS
Utility-interactive inverter using the dc current-source approach
[DE86-012135] N87-11952
Parallel scheduling of recursively defined arrays
[NASA-CR-178195] N87-12247
ARRIVALS
HF (High Frequency) absolute time of arrival sensing
[AD-A168275] N87-11917
ARTICULATION
The interactive specification of human animation N87-12196
Modeling and animating three-dimensinal articulate figures N87-12199
ARTIFICIAL INTELLIGENCE
Active control of robot manipulator compliance
[NASA-CR-177183] N87-11994
Image analysis, perception strategy and cognitive strategy — microscopy images of biological cells
[ETN-86-86401] N87-12104
Graphics Interface 1986: Proceedings
[ISSN-0713-5424] N87-12175
Graphics tools in Adagio, a robotics multitasking multiprocessor workstation N87-12191
Incremental construction of 3-D models from a sequence of framed views: Matching partial objects N87-12223
A research planning assessment for applications of artificial intelligence in manufacturing
[AD-A168692] N87-12252
Rapid prototyping facility for flight research in artificial-intelligence-based flight systems concepts
[NASA-TM-88268] N87-12273
Selective backtracking
[INPE-3867-TDL/219] N87-12274
The extraction of knowledge from data: An evaluation of Intelligent Knowledge Based Systems (IKBS) — image processing
[BAE-BT-15035] N87-12276
Topics in artificial intelligence
[INF-85-9] N87-12277
ARTS
A cel-based model for paint systems N87-12189
ASPHALT
Criteria for asphalt-rubber concrete in civil airport pavements: Mixture design
[DOT/FAA/PM-86/39] N87-11910
ASTEROID CAPTURE
Origin of asteroids and small bodies N87-12477
ASTEROID MISSIONS
Research in planetary astronomy at Palomar Observatory N87-12435
ASTEROIDS
NASA selects investigations for comet rendezvous mission
[NASA-TM-89261] N87-11806
Reports of planetary astronomy, 1985
[NASA-TM-89189] N87-12407
Infrared spectral studies of asteroids N87-12441
Studies of asteroids and comets N87-12442
Speckle interferometry applied to asteroids and other solar system objects N87-12449
Photometry of small asteroids and cometary cores N87-12451
CCD scanning for asteroids and comets N87-12452
Table Mountain Observatory support to other programs N87-12454
Planet-Crossing Asteroid Search (PCAS) N87-12455
Asteroid team N87-12460
Planet-crossing asteroids: Interrelationships within the solar system N87-12462
Radar investigation of asteroids N87-12467
Recovery of the UCAS asteroids N87-12469
A search for Earth-approaching asteroids N87-12472
Pole orientation, sidereal period, and sense of rotation of asteroids N87-12473
Asteroid shapes and pole orientation from visual and infrared photometry N87-12474
Physical properties of asteroids N87-12475
Astrometric observations of comets and asteroids and subsequent orbital investigations
[NASA-CR-179659] N87-12509
ASTIGMATISM
Large optics technology
[AD-A168222] N87-12339
ASTROGRAPHY
Atlas of Comet Halley 1910 II N87-12444
ASTROMETRY
Studies of asteroids and comets N87-12442
Atlas of Comet Halley 1910 II N87-12444
Astrometric observations of comets and asteroids and subsequent orbital investigations N87-12461
Recovery of the UCAS asteroids N87-12469
Pole orientation, sidereal period, and sense of rotation of asteroids N87-12473
Cometary dynamics N87-12479
International Halley Watch: Discipline specialists for astronomy N87-12497
Astrometric observations of comets and asteroids and subsequent orbital investigations
[NASA-CR-179659] N87-12509
ASTRONAUT TRAINING
Star City: On the 25th anniversary of the cosmonaut training center N87-11811
ASTRONOMICAL MAPS
Studies of asteroids and comets N87-12442
ASTRONOMICAL MODELS
Physical processes in comets N87-12466
Physical properties of asteroids N87-12475
The physical characteristics of the X-ray emitting gas in clusters of galaxies and constraints on dark matter N87-12514
ASTRONOMICAL PHOTOGRAPHY
High resolution imaging N87-12418
Imaging studies of comets N87-12443
Atlas of Comet Halley 1910 II N87-12444
Composition of faint comets N87-12445
Planetary spectroscopy N87-12450
Planet-Crossing Asteroid Search (PCAS) N87-12455
International Halley Watch: Discipline specialists for large scale phenomena N87-12492
Astronomical observations with an infrared array camera N87-12500
ASTRONOMICAL PHOTOMETRY
Planetary spectroscopy N87-12413
Portable high speed photometry systems for observing occultations N87-12416
Research in planetary astronomy and operation of the 2.2-meter telescope N87-12419
Asteroid team N87-12460
Planet-crossing asteroids: Interrelationships within the solar system N87-12462
Photometry of Comet Halley N87-12464
Pole orientation, sidereal period, and sense of rotation of asteroids N87-12473
A survey of nearby stars for the perturbative effects of extrasolar planetary systems N87-12482
Planetary optical and infrared imaging N87-12487
International Halley Watch: Discipline specialists for photometry and polarimetry N87-12491
International Halley Watch: Discipline specialists for infrared spectroscopy and radiometry N87-12494
Astronomical observations with an infrared array camera N87-12500
The observation and analysis of lunar occultations of stars with an emphasis on improvements to data acquisition instrumentation and reduction techniques N87-12501
A photometric investigation of the rich supercluster fourteen fifty-one plus twenty-two N87-12507
ASTRONOMICAL SPECTROSCOPY
Research in planetary astronomy N87-12410
Planetary spectroscopy N87-12413
Planetary submillimeter spectroscopy N87-12424
Modeling and investigative studies of Jovian low frequency emissions N87-12427
Planetary Fabry-Perot spectroscopy N87-12437
Spectroscopy of comets N87-12478
Determination of stellar radial velocity precision attainable with a coude spectrograph N87-12483
A research proposal on spectroscopy of gases and solids observed in the solar system N87-12489
International Halley Watch: Discipline specialists for spectroscopy and spectrophotometry N87-12496
Optical spectroscopic studies of Wolf-Rayet carbon and oxygen stars N87-12504
ASTRONOMICAL TELESCOPES
Measurement of H02 and other trace gases in the stratosphere using a high resolution far-infrared spectrometer at 28 KM
[NASA-CR-179698] N87-12069
High resolution imaging N87-12418
Research in planetary astronomy and operation of the 2.2-meter telescope N87-12419
An XUV spectroscopic observation of the white dwarf star HZ 43 N87-12505
ASTRONOMY
Techniques to improve astronomic positioning in the field
[AD-A168347] N87-12042
CCD scanning for asteroids and comets N87-12452
Workshop on Earth-Orbital Planetary Astronomy N87-12480
ASTROPHYSICS
USSR report: Space
[JPRS-USP-86-005] N87-11809
Theoretical and observational planetary physics N87-12415
ASYMPTOTES
The nonlinear sigma model: Three loops renormalization and lattice scaling
[PREPRINT-466] N87-12313
ASYMPTOTIC METHODS
Asympotic solutions to compressible laminar boundary-layer solutions for dusty-gas flow over a semi-infinite flat plate
[UTIAS-310] N87-11967
ASYMPTOTIC SERIES
Research in adaptive and decentralized stochastic control
[AD-A168752] N87-12275

M-estimation for discrete data: Asymptotic distribution theory and implications
[AD-A168532] N87-12283
Asymptotic distributions of functions of the eigenvalues of the sample covariance matrix and canonical correlation matrix in multivariate time series
[AD-A170282] N87-12306

ATLANTIC OCEAN
An annotated bibliography of the Atlantic Remote Sensing Land-Ocean Experiment (ARSLOE)
[AD-A168703] N87-12043

ATMOSPHERIC ATTENUATION
EHF (Extremely High Frequency) telecommunications system engineering model
[PB86-214814] N87-11937
A study in the variation in atmospheric transmission of different temperature blackbody sources in the 3.85 - 4.85 micron waveband
[BAE-BT-16206] N87-12076
Analyses of the atmospheric aerosol extinction in the 0.5 to 14 micron region
[FOA-C-30396-E1,E3] N87-12091

ATMOSPHERIC CHEMISTRY
Lifetimes and quenching of the B state of PO by atmospheric gases
[AD-A168735] N87-11860
A Monte Carlo description of the sampling of stratospheric ion clusters via a mass spectrometer
[AD-A168523] N87-12071

ATMOSPHERIC CIRCULATION
Balloon probe and descent apparatus exploration of Venus discussed N87-11813
Project CONDORS: Convective diffusion observed by remote sensors
[PB86-222221] N87-12079
Modification of a variational objective analysis model for new equations for pressure gradient and vertical velocity in the lower troposphere and for spatial resolution and accuracy of satellite data
[NASA-CR-4025] N87-12085
Monthly and seasonal climatology of the northern winter over the global tropics and subtropics for the period 1974 to 1983. Volume 4: 700
[AD-A168837] N87-12089
Atlas of the tropical and subtropical circulation derived from National Meteorological Center operational analyses
[PB86-206923] N87-12095

ATMOSPHERIC COMPOSITION
Global atmospheric background monitoring for selected environmental parameters BAPMoN data for 1981. Volume 2: Precipitation chemistry, continuous atmospheric carbon dioxide and suspended particulate matter
[PB86-208360] N87-12065
Study using a three-dimensional smog formation model under conditions of complex flow
[PB86-213246] N87-12080
Carbon dioxide increase and human health: Data and research requirements for determining consequences (including a bibliography for additional reading)
[DE86-012760] N87-12156
Planetary Fabry-Perot spectroscopy N87-12437
Planetary research at Lowell Observatory N87-12440
High resolution spectral imagery of comets N87-12470

ATMOSPHERIC DIFFUSION
Project CONDORS: Convective diffusion observed by remote sensors
[PB86-222221] N87-12079

ATMOSPHERIC EFFECTS
Derivation of damage functions for atmospheric degradation of materials
[PB86-213236] N87-11911

ATMOSPHERIC ENTRY
Effects of forced and free convections on structural temperatures of shuttle orbiter during reentry flight
[NASA-TM-86800] N87-11968

ATMOSPHERIC MODELS
Terrain classification for regional transport models
[KNMI-TR-81(FM)] N87-12063
A comparison of Stratospheric Aerosol and Gas Experiment 1 (SAGE 1) and Umkehr ozone profiles including a search for Umkehr aerosol effects N87-12066
Study using a three-dimensional smog formation model under conditions of complex flow
[PB86-213246] N87-12080
An alternate method for determining atmospheric stability N87-12081
Atmospheric electrical modeling in support of the NASA F106 Storm Hazards Project
[NASA-CR-179801] N87-12082
Extended atmospheres of outer planet satellites and comets
[NASA-CR-176888] N87-12519

ATMOSPHERIC RADIATION
Spectral distribution and variation of solar radiation
[DE86-012146] N87-12076

ATMOSPHERIC SCATTERING
Lunar and planetary studies N87-12429
Infrared imaging and photometry of Comet Giacobini-Zinner N87-12447

ATMOSPHERIC SOUNDING
Sodar, rawinsonde and surface layer measurements at a coastal site. Part 2: SCCCAMP (South Central Coast Aerometric Monitoring Project) data report
[AD-A168833] N87-12073

ATMOSPHERIC TURBULENCE
An alternate method for determining atmospheric stability N87-12081

ATOMIC CLOCKS
New experiments to constrain the coefficients of the Robertson transformations for inertial systems
[NASA-CR-179906] N87-12320

ATROPHY
In vivo nuclear magnetic resonance imaging
[NASA-CR-179902] N87-12326

ATTENTION
Performance regulation and error control in a test of perceptual speed
[DFVLR-FB-86-13] N87-12164
A helicopter flight evaluation of kinesthetic-tactual displays
[AD-A168302] N87-12167

ATTITUDE INDICATORS
Investigation of magnetometer errors and their compensation in the BO-105 helicopter
[DFVLR-FB-86-21] N87-11784

AUDIO FREQUENCIES
The effect of high pressure on electrical relaxation in PPO and electrical conductivity in PPO complexed with lithium salts
[AD-A168894] N87-11862

AUTOCORRELATION
Reconstruction of two-dimensional signals from the Fourier transform magnitude
[AD-A168792] N87-12289

AUTOMATA THEORY
Complete symmetry in D2L systems and cellular automata
[INF-85-14] N87-12172

AUTOMATIC CONTROL
National Forum on the Future of Automated Materials Processing in US Industry: The Role of Sensors. Report of a workshop (1st) held at Santa Barbara, California on December 16-17, 1985
[PB86-212040] N87-11912
Advanced heat-pipe heat exchanger and microprocessor-based modulating burner controls development
[PB86-203239] N87-11961
An automatic crack measuring system using the direct-current potential-difference method
[ARL-STRUC-R-419] N87-11982
Reliable welding of HSLA steels by square wave pulsing using an advanced sensing (EDAP) technique
[AD-A168762] N87-11997

AUTOMATIC FLIGHT CONTROL
Aircraft automatic-flight-control system with inversion of the model in the feed-forward path using a Newton-Raphson technique for the inversion
[NASA-TM-86209] N87-11796

AUTOMOBILE ENGINES
Advanced Gas Turbine (AGT) Technology Project
[NASA-CR-179484] N87-11995
Ceramic automotive Stirling engine program
[NASA-CR-175042] N87-12047

AUTOREGRESSIVE PROCESSES
Optimal sampling rates for auto regressive models
[AD-A168740] N87-12288

AVIONICS
General aviation activity and avionics survey
[AD-A168582] N87-11686
Systems, avionics and instrumentation of transport category helicopters
[NLR-MP-85066-U] N87-11785

AXISYMMETRIC BODIES
Application of viscous-inviscid interaction methods to transonic turbulent flows
[NASA-CR-179900] N87-11700

AXISYMMETRIC FLOW
Simulations of turbulent mixing and reacting flows and their applications to turbulence modeling
[NASA-CR-179829] N87-11960

B

BACKGROUND NOISE
Hand off integrator apparatus for signal detection
[AD-D012391] N87-11928

BACKSCATTERING
Electromagnetic backscattering by corner reflectors
[NASA-CR-179846] N87-11913
Electromagnetic backscattering by corner reflectors
[NASA-CR-179809] N87-11914
Characterization and discrimination of selected vegetation canopies from field observations of bidirectional reflectances
[NASA-CR-179837] N87-12037

BACKWARD FACING STEPS
Third-moment closure of turbulence for predictions of separating and reattaching shear flows: A study of Reynolds-stress closure model
[NASA-CR-177055] N87-11961
Numerical solution of the incompressible Navier-Stokes equations in three-dimensional generalized curvilinear coordinates
[NASA-TM-86640] N87-11964

BACTERIA
Detection, identification, and settling of bacteria from an aerosol; testing of a detector for aerosols with bacteria and preliminary investigation of settling on different surface materials
[FOA-C-40229-B2] N87-12103
Sanitary and microbiological aspects of closed environment occupied by people and animals N87-12121

BALLOON-BORNE INSTRUMENTS
Balloon probe and descent apparatus exploration of Venus discussed N87-11813
Results of the 1986 NASA/JPL Balloon Flight Solar Calibration Program
[NASA-CR-179916] N87-12048
Measurement of H02 and other trace gases in the stratosphere using a high resolution far-infrared spectrometer at 28 KM
[NASA-CR-179898] N87-12069

BAND STRUCTURE OF SOLIDS
Geometric structure, pseudo band gaps, and surface vibrational resonances on metal surfaces
[AD-A168291] N87-11876

BANDPASS FILTERS
Planetary infrared astronomy using a cryogenic postdispenser on Fourier transform spectrometers N87-12422

BANDWIDTH
Simplified design equations for an optical quarter-wave stack reflection filter
[AD-A168442] N87-12340

BARIUM TITANATES
Optical phase conjugation via four-wave mixing in barium titanate
[AD-A168908] N87-12341

BAROCLINIC INSTABILITY
On the role of moist baroclinic instability in the development of polar lows and comma clouds
[INPE-3971-PRE/984] N87-12087

BARS
Shape design sensitivity analysis of built-up structures N87-11745

BARYONS
Strange dibaryons — pion-kaon interactions on deuterium
[NOTA-INTERNA-865] N87-12331

BASALT
Thematic mapper study of Alaskan ophiolites
[NASA-CR-179728] N87-12035

BAYES THEOREM
Component testing for dynamic model verification N87-11765
Comparison of maximus/bounding and Bayes/Monte Carlo for fault tree uncertainty analysis
[DE86-011704] N87-12310

BEAMS (SUPPORTS)
The structural optimization of a spreader bar for twin lift helicopter operations N87-11759
Design, construction and utilization of a space station assembled from 5-meter erectable struts
[NASA-TM-89043] N87-11827
Control of a servomechanism for an elastic beam
[REPT-065.1708/86-0] N87-11956
Performance and design of composite beams with web openings
[PB86-213105] N87-12027

BEARING (DIRECTION)
State-space analysis of the Trident 2 mark 6 gyro
[AD-A168404] N87-11821
Techniques to improve astronomic positioning in the field
[AD-A168347] N87-12042

BEARING ALLOYS
Selection of rolling-element bearing steels for long-life application
[NASA-TM-88861] N87-11993

BEARINGS
Carburizing steel for high temperature service
[AD-A168327] N87-11877
Calculation methods for steadily loaded axial groove hydrodynamic journal bearings. Low viscosity process fluid lubrication.
[ESDU-86006] N87-11991
Eigenvalue assignment strategies in rotor systems
[NASA-CR-179906] N87-12282
BED REST
In vivo nuclear magnetic resonance imaging
[NASA-CR-179902] N87-12328
BEDROCK
Tectonic evaluation of the Nubian shield of Northeastern Sudan using thematic mapper imagery
[NASA-CR-177045] N87-12070
BEHAVIOR
Behavioral reactions of animals exposed to spaceflight conditions in the prenatal period N87-12138
BENDING
The surface crack problem in an orthotropic plate under bending and tension
[NASA-CR-179892] N87-12020
BENDING THEORY
Some observations on the behavior of the Langley model rotor blade
[NASA-CR-179880] N87-11695
Dugdale model for circumferential through-cracks in pipes loaded by bending
[AD-A170260] N87-12024
BERYLLIUM
Joining methods for beryllium: A survey
[DE86-012000] N87-12002
BIBLIOGRAPHIES
FAA helicopter/heliport research, engineering, and development bibliography, 1964-1986
[FAA/PM-86/47] N87-11798
Corrosion information and analysis: Corrosion and compatibility
[BMI-CIA-14] N87-11872
An annotated bibliography of the Atlantic Remote Sensing Land-Ocean Experiment (ARSLOE)
[AD-A168703] N87-12043
Register of research in progress on mental workload
[AD-A168210] N87-12160
Publications of the Jet Propulsion Laboratory, 1984
[NASA-CR-179870] N87-12386
BILLETS
Ultrasonic imaging and automated flaw detection system
[AD-A168195] N87-12011
BINARY ALLOYS
Primary arm spacing in chill block melt spun Ni-Mo alloys
[NASA-TM-88887] N87-11875
BINARY FLUIDS
Free convection heat transfer in the critical region of binary fluid mixtures
[DE86-006858] N87-11978
BINARY STARS
The observation and analysis of lunar occultations of stars with an emphasis on improvements to data acquisition instrumentation and reduction techniques N87-12501
Multiwavelength studies of Cygnus X-3 N87-12502
Non-thermal radiation mechanisms and processes in SS 433 and active galactic nuclei N87-12511
High energy neutrino emission from binary X-ray sources
[PREPRINT-471] N87-12529
BIOASTRONAUTICS
USSR report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, March - April 1986
[JPRS-USB-86-004] N87-12105
BIOCHEMISTRY
Biochemical indicators of emotional stress in air traffic controllers N87-12129
Skeletal muscle fatigue: Physiological and biochemical studies N87-12159
BIOELECTRICITY
Cortical representation of texture primitives N87-12227
BIOLOGICAL EFFECTS
Interview on medical program of 237-day flight N87-11814
Investigation of viability or quail embryos and chicks when eggs are exposed to gamma radiation and vibration as related to different terms of egg storage N87-12119
Behavioral reactions of animals exposed to spaceflight conditions in the prenatal period N87-12138
Carbon dioxide increase and human health: Data and research requirements for determining consequences (including a bibliography for additional reading)
[DE86-012780] N87-12156
Radiofrequency radiation: Activities and issues
[PB86-217155] N87-12157
BIOLOGICAL MODELS (MATHEMATICS)
Mathematical models of fluid-electrolyte metabolism N87-12106
Mathematical model of cupuloendolymphatic system with different cupula and endolymph densities — semicircular canals N87-12123
BIOMASS
Interpreting forest and grassland biome productivity utilizing nested scales of image resolution and biogeographical analysis
[NASA-CR-179803] N87-12029
BIOPHYSICS
Mathematical model of cupuloendolymphatic system with different cupula and endolymph densities — semicircular canals N87-12123
BIOSATELLITES
Specialized equipment for magnetic recording of physiological data for experiments aboard biosatellites N87-12144
BIPOLAR TRANSISTORS
Static series voltage margin of I2L — transistors
[REPT-86SO] N87-11955
BIRDS
Investigation of viability of quail embryos and chicks when eggs are exposed to gamma radiation and vibration as related to different terms of egg storage N87-12119
BISMUTH OXIDES
Analysis of the liquid crystal light valve using Bi12SiO20 as the photoconductor
[LR49625] N87-12375
A model for the liquid crystal light valve. Part 1: Analysis of charge trapping in the BSO and its effect on the device resolution
[BAE-BT-15603] N87-12376
BIT ERROR RATE
Comparisons of the two-state Markov and Fritchman models as applied to bit error statistics in communication channels
[PB86-213485] N87-11935
BL LACERTAE OBJECTS
X-ray studies of BL lacertae objects N87-12506
BLOOD
Paramecium test for toxic substances in human blood during simulated weightlessness N87-12115
BLOOD CIRCULATION
Venous pressure in jugular vein system and effectiveness of blood return to right heart during 120-day head-down tilt N87-12111
Typological characteristics of central hemodynamics of monkeys in clinostatic and orthostatic positions N87-12116
USSR report: Space Biology and Aerospace Medicine, vol. 20, no. 4, July - August 1986
[JPRS-USB-86-006] N87-12124
Orthostatic cardiac rhythm response in waking Macaca mulatta monkeys N87-12147
Slowly-developing modifications in cutaneous circulatory control
[AD-A168702] N87-12152
BLOOD PLASMA
Blood serum enzyme activity in healthy man with simulation of effects of weightlessness N87-12114
BLOOD PRESSURE
Venous pressure in jugular vein system and effectiveness of blood return to right heart during 120-day head-down tilt N87-12111
BLOOD VOLUME
Effect of coamide and folicobalamin on erythropoiesis under normal living conditions and during antiorthostatic hypokinesia N87-12136
BLOOD-BRAIN BARRIER
Effects of microwave radiation on the blood-brain barrier
[PB86-213220] N87-12158
BLUNT BODIES
Maximum lift/drag ratio of flat plates with bluntness and skin friction at hypersonic speeds
[NASA-TM-88338] N87-11698
BO-105 HELICOPTER
Investigation of magnetometer errors and their compensation in the BO-105 helicopter
[DFVLR-FB-86-21] N87-11784
BODY FLUIDS
Mathematical models of fluid-electrolyte metabolism N87-12106
BODY KINEMATICS
Mathematical model of human kinematic reactions to impacts N87-12133
Linear and rotational acceleration of a 3D rigid body
[MED-INFO-SHEET-715] N87-12319
BOLTS
Applying, measuring and maintaining pretension in steel bolts
[ESDU-86014] N87-12015
BONE MARROW
Effect of hydrocortisone on osteogenic function of mouse bone marrow N87-12122
BONES
Effect of hydrocortisone on osteogenic function of mouse bone marrow N87-12122
BOREHOLES
Mathematical and statistical analysis
[AD-A169277] N87-11930
BOREL SETS
N-dimensional totally disconnected topological groups
[REPT-296] N87-12318
BORON NITRIDES
High-purity, fine-particle boron nitride powder synthesis at -75 to 750C, report of investigations
[PB86-217940] N87-11900
BOTSWANA
Environmental processes and spectral reflectance characteristics associated with soil erosion in desert fringe regions
[NASA-CR-179729] N87-12036
BOUNDARIES
Sequential estimation of boundaries in texture images N87-12234
Recognition of two-dimensional shapes
[AD-A168403] N87-12250
BOUNDARY LAYER EQUATIONS
Analysis of compressible boundary layer with real gas effects N87-11689
Boundary layer and parabolic flows
[ESA-TT-918] N87-11979
BOUNDARY LAYER FLOW
Third-moment closure of turbulence for predictions of separating and reattaching shear flows: A study of Reynolds-stress closure model
[NASA-CR-177055] N87-11961
Boundary layer and parabolic flows
[ESA-TT-918] N87-11979
BOUNDARY LAYER TRANSITION
Pitot and static errors in steady level flight
[ESDU-86008] N87-11991
BOUNDARY LAYERS
Sodar, rawinsonde and surface layer measurements at a coastal site. Part 2: SCCCAMP (South Central Coast Aerometric Monitoring Project) data report
[AD-A168833] N87-12073
BOUNDARY VALUE PROBLEMS
Shape design sensitivity analysis of built-up structures N87-11746
The role of damage-softened material behavior in the fracture of composites and adhesives
[NASA-CR-179640] N87-11846
Numerical methods for the solution of ordinary differential equations: Initial value problems
[ESDU-86011] N87-12260
BRANCHING (MATHEMATICS)
Bifurcations in unsteady aerodynamics
[NASA-TM-88316] N87-11697
Enhancements to the STAGS computer code
[NASA-CR-4000] N87-12019
BRAZILIAN SPACE PROGRAM
The Brazilian satellite remote sensing
[INPE-4006-PRE/999] N87-12040
BRIGHTNESS TEMPERATURE
Lunar and planetary studies N87-12429
BRITTLENESS
Carburizing steel for high temperature service
[AD-A168327] N87-11877
BROMINATION
Thermal conductivity of pristine and brominated P-100 fibers
[NASA-TM-88863] N87-11898
BROMINE
Simultaneous electrical resistivity and mass uptake measurements in bromine intercalated fibers
[NASA-TM-88900] N87-11841
BUBBLE MEMORY DEVICES
A solid state data recorder for space-based applications using magnetic bubble memory
[AD-A168909] N87-11984
Feasibility study in wall-coded magnetic bubble memory devices
[BR90249] N87-12168
BUCKLING
User manual for BUNVIS-RG: An exact buckling and vibration program for lattice structures, with repetitive geometry and substructuring options
[NASA-TM-87669] N87-12018
BUFFER STORAGE
Hardware assistance for Z-buffer visible surface algorithms N87-12205
BULK MODULUS
The elastic constants of NiAl to 1.4 GPa
[AD-A168813] N87-11879

BURNERS
Advanced heat-pipe heat exchanger and microprocessor-based modulating burner controls development
[PB86-203236] N87-11961
BURNING RATE
Electro-optical control of solid fuel rocket burn rate
[AD-D012397] N87-11839
BURNS (INJURIES)
Human tolerance to high-intensity contact heat on integumental surface N87-12137
BUS CONDUCTORS
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A168450] N87-11685

C

CADMIUM SULFIDES
Optimization of p-CuInSe sub 2/n-CdZnS solar cells
[DE86-010700] N87-12052
CADMIUM TELLURIDES
Zone leveling and solution growth of complex compound semiconductors in space
[NASA-CR-179684] N87-12356
CALCULUS OF VARIATIONS
Application of satellite data to the variational analysis of the three dimensional wind field
[NASA-CR-4022] N87-12064
Statistical mechanics of charged objects: General method and applications to simple systems
[AD-A168916] N87-12329
CALIBRATING
Motion characteristics of the UTIAS flight research simulator motion-base
[UTIAS-TN-261] N87-11902
Results of the 1986 NASA/JPL Balloon Flight Solar Calibration Program
[NASA-CR-179916] N87-12048
Measurement of radiation intensity at the solar tower plant SSPS/CRS of the IEA in Spain
[ESA-TT-961] N87-12055
CALIFORNIA
Sodar, rawinsonde and surface layer measurements at a coastal site. Part 2: SCCCAMP (South Central Coast Aerometric Monitoring Project) data report
[AD-A168939] N87-12075
CALORIMETERS
Calorimetric measurements of the equivalent series resistance of low-loss, high repetition rate pulse discharge capacitors
[DE86-011232] N87-11948
A hardware processor for a missing energy trigger
[PREPRINT-468] N87-12336
CANADA
An ecologic study of peat landforms in Canada and Alaska
[NASA-CR-179740] N87-12033
Relationship of field tests to laboratory tests of muscular strength and endurance, and maximal aerobic power
[AD-A168260] N87-12150
Integration of remotely sensed data and geographic information systems N87-12216
CANONICAL FORMS
The inference machine laboratory: Graphic tools for knowledge management N87-12180
CANOPIES (VEGETATION)
Characterization and discrimination of selected vegetation canopies from field observations of bidirectional reflectances
[NASA-CR-179637] N87-12037
CANTILEVER BEAMS
Multiobjective optimization techniques for structural design N87-11760
The role of damage-softened material behavior in the fracture of composites and adhesives
[NASA-CR-179640] N87-11846
CAPACITORS
Calorimetric measurements of the equivalent series resistance of low-loss, high repetition rate pulse discharge capacitors
[DE86-011232] N87-11948
CAPILLARIES (ANATOMY)
Distinctions of capillarization of white rat skeletal muscle during adaptation to high altitude of the Pamirs and Antarctica N87-12117
CARBON CYCLE
Interpreting forest and grassland biome productivity utilizing nested scales of image resolution and biogeographical analysis
[NASA-CR-179609] N87-12029
CARBON DIOXIDE
Reductive disproportionation of carbon dioxide by dianionic carbonylmetalates of the transition metals
[AD-A168211] N87-11859
CARBON DIOXIDE CONCENTRATION
Use of gas mixtures with high oxygen and carbon dioxide content to normalize external respiration and blood acid-base equilibrium in presence of muscle fatigue N87-12132
Carbon dioxide increase and human health: Data and research requirements for determining consequences (including a bibliography for additional reading)
[DE86-012760] N87-12156
CARBON DIOXIDE LASERS
Absorption of CO2 laser beams by metallic alloys. Application to laser thermal treatment
[ISL-CO-217/85] N87-11990
CARBON FIBER REINFORCED PLASTICS
Fretting fatigue of carbon fiber reinforced plastic laminates
[DFVLR-FB-86-18] N87-11855
CARBON FIBERS
Structural evaluation of high strain fiber and resin composite material systems
[AD-A170464] N87-11852
CARBON STARS
Optical spectroscopic studies of Wolf-Rayet carbon and oxygen stars N87-12504
CARBON STEELS
Effect of laser hardening on microstructure and wear resistance in medium carbon/chromium steels
[DE86-012021] N87-11860
CARBONATES
Electrochemical investigation of lithium/potassium carbonate eutectic for application in modeling the molten carbonate fuel cell cathode
[DE86-001067] N87-11944
CARBONYL COMPOUNDS
Reductive disproportionation of carbon dioxide by dianionic carbonylmetalates of the transition metals
[AD-A168211] N87-11859
CARBURIZING
Carburizing steel for high temperature service
[AD-A168327] N87-11877
CARDIOVASCULAR SYSTEM
Typological characteristics of central hemodynamics of monkeys in clinostatic and orthostatic positions N87-12116
Capabilities of ultrasonic methods of evaluating hemodynamics of cardiocerebrovascular system N87-12126
Relationship between constitutional distinctions and functional characteristics of the cardiovascular system of healthy subjects and patients with hypertension in clinostatic and orthostatic position N87-12143
Orthostatic cardiac rhythm response in waking Macaca mulatta monkeys N87-12147
Problems of aviation and space medicine, biology and psychology discussed at fifteenth Gagarin Scientific Lectures N87-12148
Slowly-developing modifications in cutaneous circulatory control
[AD-A168702] N87-12152
CARGO AIRCRAFT
Aircraft accident reports: Brief format, US civil and foreign aviation, issue number 5 of 1985 accidents
[PB86-916019] N87-11710
CASCADE FLOW
Pressure and flow field measurements of axial turbine tip clearance flow in a linear cascade
[CUED/A-TURBO-TR-123] N87-11791
CASES (CONTAINERS)
Thermal analysis of radiometer containers for the 122m hoop column antenna concept
[NASA-TM-89026] N87-11956
CASSEGRAIN OPTICS
Large optics technology
[AD-A168222] N87-12339
CASTING
Fabrication of cooled radial turbine rotor
[NASA-CR-179603] N87-11789
CATACLYSMIC VARIABLES
The emission lines from accretion disks in cataclysmic variable systems N87-12513
CATALYSIS
Catalytic combustion component and system prototype development
[PB86-211380] N87-11860
CATALYSTS
Reductive disproportionation of carbon dioxide by dianionic carbonylmetalates of the transition metals
[AD-A168211] N87-11859
CATALYTIC ACTIVITY
Reductive disproportionation of carbon dioxide by dianionic carbonylmetalates of the transition metals
[AD-A168211] N87-11859
CATECHOLAMINE
Stress and neuroendocrine regulation of immune responses
[AD-A168768] N87-12155
CATHODES
Structure and activity of Pt-Co alloys as oxygen reduction electrocatalysts
[DE86-012931] N87-11867
CAVITATION FLOW
Effect of vibration amplitude on vapor cavitation in journal bearings
[NASA-TM-88828] N87-11962
CAVITY RESONATORS
RF field profiles in weakly irregular open resonators
[INPE-3957-PRE/975] N87-11938
CELESTIAL GEODESY
Techniques to improve astronomic positioning in the field
[AD-A168347] N87-12042
Planetary astronomy N87-12445
CELL CATHODES
Electrochemical investigation of lithium/potassium carbonate eutectic for application in modeling the molten carbonate fuel cell cathode
[DE86-001067] N87-11944
CENTRAL PROCESSING UNITS
Plurality of processors where access to the common memory requires only a single clock interval
[AD-D012365] N87-12269
CERAMIC COATINGS
Investigation of coating performance and corrosion of compressor components in the TF30-P-3 engine of F111C aircraft
[AD-A168602] N87-11792
Thermal barrier coating life prediction model development
[NASA-CR-179506] N87-11892
Advanced Gas Turbine (AGT) Technology Project
[NASA-CR-179484] N87-11995
CERAMIC MATRIX COMPOSITES
Materials science and engineering at the Oak Ridge National Laboratory. Abstracts
[DE86-011477] N87-11842
Advanced Gas Turbine (AGT) Technology Project
[NASA-CR-179484] N87-11995
CERAMICS
Materials science and engineering at the Oak Ridge National Laboratory. Abstracts
[DE86-011477] N87-11842
Surface chemistry and structural effects in the stress corrosion of glass and ceramic materials
[AD-A170243] N87-11896
High-purity, fine-particle boron nitride powder synthesis at -75 to 750C, report of investigations
[PB86-217940] N87-11900
Corrosion resistance of selected ceramic materials to sulfuric acid, report of investigations
[PB86-212364] N87-11901
Ceramic automotive Stirling engine program
[NASA-CR-179042] N87-12047
CEREBRAL CORTEX
Capabilities of ultrasonic methods of evaluating hemodynamics of cardiocerebrovascular system N87-12126
CEREBRUM
Stress and neuroendocrine regulation of immune responses
[AD-A168768] N87-12155
CERES ASTEROID
Occultation studies of the solar system N87-12463
Passive microwave remote sensing of the asteroids using the VLA: Continuation N87-12476
CESSNA AIRCRAFT
National Transportation Safety Board safety recommendation N87-11706
CH-54 HELICOPTER
The structural optimization of a spreader bar for twin lift helicopter operations N87-11759
CHALCOGENIDES
High-efficiency, thin-film, cadmium chalcogenide photoelectrochemical cell with in situ storage
[DE86-004451] N87-11945
CHALLENGER (ORBITER)
Investigation of the Challenger accident
[H-REPT-99-1016] N87-11824
CHANNEL CAPACITY
On nonGaussian signal detection and channel capacity
[AD-A170239] N87-11927
Information capacity of the mismatched Gaussian channel
[AD-A170255] N87-12305
CHANNEL NOISE
Information capacity of the mismatched Gaussian channel
[AD-A170255] N87-12305
CHANNELS (DATA TRANSMISSION)
A class of stable transmission algorithms for varying user models
[AD-A168701] N87-11929

Comparisons of the two-state Markov and Fritchman models as applied to bit error statistics in communication channels
[PB86-213485] N87-11935
A multilayer channel router for nonrectangular channels --- wiring
[INF-86-9] N87-11957
Implementation of the Twente University Multiprocessor (TUMULT)-15 network interface for the VME bus
[INF-86-11] N87-12272

CHARACTER RECOGNITION
Optical character recognition of touching characters
N87-12239

CHARGE COUPLED DEVICES
CCD scanning for asteroids and comets N87-12452

CHARGED PARTICLES
Non-Maxwellian free-energy generation in the magnetotail due to chaotic particle motion
[AD-A168504] N87-12351

CHARON
A continued program of planetary study at the University of Texas McDonald Observatory N87-12433
Speckle interferometry applied to asteroids and other solar system objects N87-12449
Asteroid shapes and pole orientation from visual and infrared photometry N87-12474

CHARPY IMPACT TEST
Correlation of fracture toughness and Charpy impact test results --- steels
[TR1063] N87-12016

CHEMICAL ANALYSIS
Materials science and engineering at the Oak Ridge National Laboratory. Abstracts
[DE86-011477] N87-11842
Electrochemical investigation of lithium/potassium carbonate eutectic for application in modeling the molten carbonate fuel cell cathode
[DE86-001067] N87-11944
Combining automatic titration of total iron and sulfur in thermal battery materials
[DE86-007802] N87-11946
Evaluation of method for collecting and concentrating organic trace impurities in air N87-12145

CHEMICAL COMPOSITION
NASA selects investigations for comet rendezvous mission
[NASA-TM-89261] N87-11806
Criteria for asphalt-rubber concrete in civil airport pavements: Mixture design
[DOT/FAA/PM-86/39] N87-11910
Spectral characteristics and the extent of paleosols of the Palouse formation
[NASA-CR-179727] N87-12034
Thematic mapper study of Alaskan ophiolites
[NASA-CR-179728] N87-12035
A comparison of Stratospheric Aerosol and Gas Experiment 1 (SAGE 1) and Umkehr ozone profiles including a search for Umkehr aerosol effects
N87-12066
Spatially resolved quantitative spectroscopy of comets
N87-12471
Basalt depths in lunar basins using impact craters as stratigraphic probes: Evaluation of a method using orbital geochemical data
[NASA-CR-179856] N87-12521

CHEMICAL ENGINEERING
Detecting glass fibers using computer vision
N87-12237

CHEMICAL EXPLOSIONS
Safety aspects of large-scale combustion of hydrogen
[DE86-007375] N87-11884

CHEMICAL PROPERTIES
Environmentally stable polymers and coatings for space application: CH-5, supplement 10
[NASA-CR-177181] N87-11890
F100 fuel sampling analysis: Foreign samples
[AD-A168573] N87-11904

CHEMICAL REACTIONS
Reductive disproportionation of carbon dioxide by dianionic carbonylmetalates of the transition metals
[AD-A168211] N87-11859
Electrochemical effects on weld pool chemistry in submerged arc and dc electroslag welding
[DE86-012117] N87-12003
Interfacial reactions between amorphous W-Si thin films and polycrystalline overlayers
[DE86-008959] N87-12372

CHEMICAL REACTORS
Receiver/reactor concepts for thermochemical transport of solar energy
[DE86-010859] N87-12054
Research on mercury cadmium telluride
[AD-A170477] N87-12371

CHEMILUMINESCENCE
Kinetic and spectroscopic studies of chemical intermediates at both high and low temperatures
[AD-A168758] N87-11861
Calculation of potential energy surfaces for HCO and HNO using many-body methods
[AD-A169611] N87-11863

CHIPS (ELECTRONICS)
Proposition of a design methodology for integrated communication circuits. Implementation of a circuit for the FIP local network
[ETN-86-98399] N87-11934
VLSI (Very Large Scale Integrated circuits) implementation of a quantized sinusoid filter algorithm and its use to compute the discrete Fourier transform, part 2
[AD-A168605] N87-11942
Definition, study and design of a specific self-checking microprocessor COBRA
[ETN-86-98402] N87-12173

CHROMATOGRAPHY
Supercritical fluid chromatography/supersonic jet spectroscopy
[DE86-011278] N87-11865

CHROMIUM STEELS
Effect of laser hardening on microstructure and wear resistance in medium carbon/chromium steels
[DE86-012021] N87-11880

CHROMOSPHERE
Chromospheric activity of cool giant stars
[NASA-CR-177184] N87-12510
Gamma rays and neutrons from solar flares
N87-12528

CIRCADIAN RHYTHMS
Slowly-developing modifications in cutaneous circulatory control
[AD-A168702] N87-12152
Biological rhythms and rotating shift work: Some considerations for air traffic controllers and managers
[AD-A168742] N87-12153
Human exercise and heat exchange in thermal environments
[AD-A168746] N87-12154

CIRCUITS
Engineering limits of photoconductive semiconductor switches in pulsed power applications
[DE86-012282] N87-11951
Optics '86: Four Western European Countries Review Recent Achievements
[AD-A170262] N87-12344

CIRCULAR CYLINDERS
Numerical solution of the incompressible Navier-Stokes equations in three-dimensional generalized curvilinear coordinates
[NASA-TM-86840] N87-11964

CIRCULAR SHELLS
A thin cylinder problem
[AD-A168665] N87-12251

CIVIL AVIATION
General aviation activity and avionics survey
[AD-A168582] N87-11686
Aircraft accident reports: Brief format, US civil and foreign aviation, issue number 5 of 1985 accidents
[PB86-916919] N87-11710
Aircraft accident reports: Brief format, US civil and foreign aviation, issue number 4 of 1985 accidents
[PB86-916918] N87-11712
Aircraft accident reports: Brief format, US civil and foreign aviation, issue number 3 of 1985 accidents
[PB86-916917] N87-11713
Review of accident data: US general aviation calendar year 1982
[PB86-201910] N87-11714

CLASSIFICATIONS
Terrain classification for regional transport models
[KNMI-TR-81(FM)] N87-12063
Classification of weakly infinite-dimensional spaces and essential mappings
[REPT-289] N87-12317
Psychological concepts in a parallel system
[AD-A169615] N87-12390

CLEAR AIR TURBULENCE
Clear air turbulence analysis using isentropic methods
[AD-A168400] N87-12068

CLIMATE
Monthly and seasonal climatology of the northern winter over the global tropics and subtropics for the period 1974 to 1983. Volume 4: 700
[AD-A168637] N87-12069

CLIMATOLOGY
Monthly and seasonal climatology of the northern winter over the global tropics and subtropics for the period 1974 to 1983. Volume 4: 700
[AD-A168637] N87-12069
Equatorial Pacific Ocean Climate Studies (EPOCS): Progress and plans
[PB86-213493] N87-12092

CLOSED ECOLOGICAL SYSTEMS
Sanitary and microbiological aspects of closed environment occupied by people and animals
N87-12121

CLOUD COVER
World atlas of total sky-cover: Environmental research papers
[AD-A170474] N87-12090

CLOUD GLACIATION
Comparative flight measurement of icing parameters for the DO 28 D2 propeller-driven aircraft of the German Army Testing Office 61 and for DFVLR's Falcon 20 E jet aircraft in stratus clouds
[ESA-TT-941] N87-11709

CLOUDS
Galaxy groups: Neutral hydrogen and dynamics
N87-12512

CLOUDS (METEOROLOGY)
On the role of moist baroclinic instability in the development of polar lows and comma clouds
[INPE-3971-PRE/984] N87-12087

CLUMPS
Synthesis and crystal and molecular structure of In(C5Me5)-An apparent octahedral cluster
[AD-A168281] N87-12360

CLUSTER ANALYSIS
Spectral characteristics and the extent of paleosols of the Palouse formation
[NASA-CR-179727] N87-12034

COASTS
An annotated bibliography of the Atlantic Remote Sensing Land-Ocean Experiment (ARSLOE)
[AD-A168703] N87-12043
Sodar, rawinsonde and surface layer measurements at a coastal site. Part 2: SCCCAMP (South Central Coast Aerometric Monitoring Project) data report
[AD-A168633] N87-12073
Mariners Weather Log, volume 30, number 2, spring 1986
[PB86-213360] N87-12083
Pacific Coast hindcast deepwater wave information
[AD-A168511] N87-12098

COATINGS
Raman determination of molecular structure and physical properties of dielectric coatings
[DE86-011620] N87-11897
Nature and origin of mineral coatings on volcanic rocks of the Black Mountain, Stonewall Mountain and Kane Springs Wash volcanic centers, southern Nevada
[NASA-CR-179738] N87-12067
Large optics technology
[AD-A168222] N87-12338

COAXIAL CABLES
Practical considerations of the topological approach to electromagnetic interference control
[AD-A168518] N87-11921

COBALT ALLOYS
Structure and activity of Pt-Co alloys as oxygen reduction electrocatalysts
[DE86-012531] N87-11867

COCKPIT SIMULATORS
A helicopter flight evaluation of kinesthetic-tactual displays
[AD-A168302] N87-12167

CODERS
Using off the shelf code generators in the Delft Ada Subset (DAS) compiler: Some experiences
[REPT-85-37] N87-12263

CODING
Investigation of the external flow analysis for density measurements at high altitude
[NASA-CR-172464] N87-11683
Pulse Code Modulation (PCM) encoder handbook for Aydin Vector MMP-600 series system
[NASA-RP-1171] N87-11916
METEOSAT raw image data encryption
[ESA-CR(P)-2234] N87-11932
An encoding scheme for presentation graphics with animation N87-12177
Using caching and breadth-first search to speed up ray-tracing N87-12184
Principle of visual color coding applied to satellite imagery N87-12220
A file organization scheme for polygon data
N87-12221
Recognition of two-dimensional shapes
[AD-A168403] N87-12250
Using off the shelf code generators in the Delft Ada Subset (DAS) compiler: Some experiences
[REPT-85-37] N87-12263

COGNITION
Psychological concepts in a parallel system
[AD-A169615] N87-12390

COHERENT LIGHT
Laser based information systems (selected pages)
[AD-A168418] N87-11988

COLD WEATHER TESTS
Antimisting kerosene: Evaluation of low temperature performance
[DOT/FAA/CT-85/31] N87-11902
COLLISION AVOIDANCE
Runway incursions at controlled airports in the United States
[PB86-917003] N87-11711
COLOR
Psychophysiological aspects of color-coding of flight and navigation information on onboard electronic displays N87-12127
Profiling graphic display systems N87-12183
COLOR VISION
Image segmentation based on color and texture gradient N87-12217
Principle of visual color coding applied to satellite imagery N87-12220
Detection of specularities in colour images using local operators N87-12235
COMBINATORIAL ANALYSIS
A strongly polynomial algorithm for minimum cost submodular flow problems
[PREPRINT-102] N87-12293
COMBUSTIBLE FLOW
Simulations of turbulent mixing and reacting flows and their applications to turbulence modeling
[NASA-CR-179829] N87-11960
COMBUSTION CHAMBERS
User's manual for a TEACH computer program for the analysis of turbulent, swirling reacting flow in a research combustor
[NASA-CR-179547] N87-11858
COMBUSTION CHEMISTRY
Catalytic combustion component and system prototype development
[PB86-211380] N87-11869
Hydrogen: Air steam flammability limits and combustion characteristics at intermediate scale
[TI86-009661] N87-11871
COMBUSTION CONTROL
Safety aspects of large-scale combustion of hydrogen
[DE86-007375] N87-11864
COMBUSTION EFFICIENCY
Size distribution of unburned aluminum particles in solid propellant rocket motor exhaust
[DE86-013376] N87-11840
COMBUSTION PRODUCTS
Combustion gas spectroscopy using tunable lasers
[DE86-012873] N87-11868
COMBUSTION STABILITY
Electro-optical control of solid fuel rocket burn rate
[AD-D012397] N87-11839
COMET NUCLEI
NASA selects investigations for comet rendezvous mission
[NASA-TM-89261] N87-11806
TASS reports VEGAS-1 encounter with Halley's Comet N87-11812
Planetary research at Lowell Observatory N87-12440
Photometry of small asteroids and cometary cores N87-12451
CCD scanning for asteroids and comets N87-12452
Infrared photometry of periodic comets N87-12453
Optical investigation of Comet Halley N87-12457
Photometry of Comet Halley N87-12464
Physical processes in comets N87-12465
Physical properties of asteroids N87-12475
Spectroscopy of comets N87-12478
International Halley Watch: Discipline specialists for near-nucleus studies N87-12495
COMET TAILS
Imaging studies of comets N87-12443
Optical investigation of Comet Halley N87-12457
Origin of asteroids and small bodies N87-12477
International Halley Watch: Discipline specialists for large scale phenomena N87-12492
COMETARY ATMOSPHERES
Reports of planetary astronomy, 1985

COMMUNICATION
Public perspectives on government information technology: A review of survey research on privacy, civil liberties and the democratic process
[PB86-218419] N87-12399
Technology transfer primer
[PB86-205341] N87-12404
COMMUNICATION NETWORKS
US long distance fiber optic networks: Technology, evolution and advanced concepts. Volume 3: Advanced networks and economics
[NASA-CR-179481] N87-11915
A class of stable transmission algorithms for varying user models
[AD-A168701] N87-11923
Proposition of a design methodology for integrated communication circuits. Implementation of a circuit for the FIP local network
[ETN-86-98399] N87-11934
COMMUNICATION SATELLITES
Strategic plan, 1985
[NASA-TM-89263] N87-12384
COMPANION STARS
Determination of stellar radial velocity precision attainable with a coude spectrograph N87-12483
The observation and analysis of lunar occultations of stars with an emphasis on improvements to data acquisition instrumentation and reduction techniques N87-12501
COMPARISON
Comparisons of the two-state Markov and Fritchman models as applied to bit error statistics in communication channels
[PB86-213485] N87-11935
COMPILERS
Using off the shelf code generators in the Delft Ada Subset (DAS) compiler: Some experiences
[REPT-85-37] N87-12263
COMPONENT RELIABILITY
Estimating jointly system and component reliabilities using a mutual censorship approach
[AD-A168544] N87-12013
COMPOSITE MATERIALS
Heat resistant matrix materials — advanced composite materials
[FOA-C-20618-2.1] N87-11856
Activities report in metal structures industry scientific and technical studies
[ISSN-0524-7705] N87-11886
Performance and design of composite beams with web openings
[PB86-213105] N87-12027
COMPOSITE STRUCTURES
Example of the use of Data Item No. 85001. Choice of reinforcement for a circular hole in a fibre reinforced laminated plate. (Data relating to one particular set of laminate properties)
[ESDU-86003] N87-11844
Finite element modelling of composites, volume 1
[BR97502] N87-11845
Statistical strength comparison of metal matrix and polymeric matrix composites
[AD-A168847] N87-11850
Automated tape laying machine for composite structures
[AD-D012366] N87-11851
Expandable epoxy application
[AD-A168869] N87-11895
Observation of the initiation and progression of damage in compressively loaded composite plates containing a cutout
[NASA-CR-179911] N87-12022
COMPOUNDING
DFR (Decreasing Failure Rate) property of first passage times and its preservation under geometric compounding
[AD-A168671] N87-12304
COMPRESSED GAS
Fundamental study of dense-fluid detonation
[AD-A168753] N87-11906
COMPRESSIBILITY EFFECTS
Vortex shedding of a square cylinder in front of a slender airfoil at high Reynolds numbers. Part 2: Compressibility effect
[MPIS-24/1985] N87-11704
COMPRESSIBLE BOUNDARY LAYER
Analysis of compressible boundary layer with real gas effects N87-11689
Improvement of mechanical model in the entrainment method for compressible turbulent boundary layer
[AD-A168451] N87-11970
COMPRESSIBLE FLOW
Improvement of mechanical model in the entrainment method for compressible turbulent boundary layer
[AD-A168451] N87-11970
COMPRESSIBLE FLUIDS
A viscous/inviscid zonal method for the computation of 2 and 3-dimensional compressible fluid flows with separation N87-11958
COMPRESSING
Integrated natural gas engine cooling jacket vapor compressor program, phase 1A
[PB86-215662] N87-12009
COMPRESSION LOADS
Observation of the initiation and progression of damage in compressively loaded composite plates containing a cutout
[NASA-CR-179911] N87-12022
COMPRESSORS
Investigation of coating performance and corrosion of compressor components in the TF30-P-3 engine of F111C aircraft
[AD-A168802] N87-11792
Free-piston Stirling engine development
[PB86-213980] N87-12010
COMPTON EFFECT
X-ray studies of BL lacertae objects N87-12506
COMPUTATION
Contribution to the analysis of high-lift airfoil aerodynamics
[AD-A168401] N87-11703
Sensitivity analysis and approximation methods for general eigenvalue problems
[NASA-CR-179538] N87-12021
Generalized network implementations
[AD-A168298] N87-12266
Evaluation of L sub 1 codes using polynomial approximation problems
[PB86-215175] N87-12301
COMPUTATIONAL FLUID DYNAMICS
Analysis of compressible boundary layer with real gas effects N87-11689
Calculated effects of varying Reynolds Number and dynamic pressure on flexible wings at transonic speeds N87-11738
The prediction of transonic loading advancing helicopter rotors
[AD-A168217] N87-11781
Third-moment closure of turbulence for predictions of separating and reattaching shear flows: A study of Reynolds-stress closure model
[NASA-CR-177055] N87-11961
Transformation of two and three-dimensional regions by elliptic systems
[NASA-CR-179851] N87-12281
COMPUTATIONAL GRIDS
Discretizations for multigrid methods
[TUM-I8519] N87-12278
Transformation of two and three-dimensional regions by elliptic systems

Image techniques for the identification of depressions and other obstacles in automated guidance of roving robots N87-12224
A computational theory of 3D shape reconstruction from image contours N87-12225
Selection and use of image features for segmentation of boundary images N87-12226
Speeded phase discrimination: Evidence for global to local processing N87-12228
Correspondence in apparent motion: Defining the heuristics N87-12229
Three processing characteristics of texture discrimination N87-12230
Edge-only matching techniques in robot vision N87-12232
A method of learning rules from uncertain data applied to the computer vision problem N87-12233
Detection of specularities in colour images using local operators N87-12235
Detecting glass fibers using computer vision N87-12237
Development of algorithms and hardware for structured-light vision
[AD-A189197] N87-12336
COMPUTERIZED SIMULATION
Fundamental differences between optimization code test problems in engineering applications N87-11772
Radon optical processing in radon space
[AD-A189612] N87-11943
Simulations of turbulent mixing and reacting flows and their applications to turbulence modeling
[NASA-CR-179629] N87-11960
Kinematic and geometric modelling and animation of robots N87-12178
Fractals, computers and DNA N87-12214
Computer simulation of on-orbit manned maneuvering unit operations
[NASA-CR-179604] N87-12245
A network architecture for data-driven systems
[AD-A188764] N87-12267
Psychological concepts in a parallel system
[AD-A189615] N87-12390
CONCRETES
Criteria for asphalt-rubber concrete in civil airport pavements: Mixture design
[DOT/FAA/PM-86/39] N87-11910
CONCURRENT PROCESSING
The implementation and use of Ada on distributed systems with high reliability requirements
[NASA-CR-179642] N87-12265
CONDENSATION PUMPS
High throughput continuous cryopump
[DE86-010623] N87-12000
CONFERENCES
Recent Experiences in Multidisciplinary Analysis and Optimization, part 1
[NASA-CP-2327-PT-1] N87-11717
Graphics Interface 1986: Proceedings
[ISSN-0713-5424] N87-12175
Supersymmetry: Proceedings
[DE86-007853] N87-12334
Topical Meeting on Microphysics of Surfaces, Beams and Adsorbates held at Santa Fe, New Mexico on 4 - 6 February 1986
[AD-A188618] N87-12364
CONFIDENCE LIMITS
Estimating jointly system and component reliabilities using a mutual censorship approach
[AD-A188544] N87-12013
CONFIGURATION MANAGEMENT
ELAND: An expert system for the configuration of local area networks applications
[REPT-86-008] N87-12270
CONFINEMENT
Radial Fokker-Planck model for plasmas confined by magnetic mirror fields
[DE86-012225] N87-12353
CONFORMAL MAPPING
Classification of weakly infinite-dimensional spaces and essential mappings
[REPT-289] N87-12317
CONGRESSIONAL REPORTS
Delta launch vehicle accident investigation
[GPO-85-141] N87-11820
Investigation of the Challenger accident
[H-REPT-99-1016] N87-11824
Authorization of appropriations for the National Aeronautics and Space Administration for Fiscal Year 1987
[S-REPT-99-601] N87-12400
Making appropriations for the Department of Housing and Urban Development and for sundry independent agencies, boards, commissions, corporations and offices for the fiscal year ending September 30, 1987
[GPO-64-330] N87-12401
Hearings before the Subcommittee on Space Science and Applications of the Committee on Science and Technology, 99th Congress, 2nd Session, No. 132, 25, 27 February; 11, 13, 20 March; 9, 10 April, 1986, Volume 2
[GPO-61-777] N87-12402
CONICAL BODIES
Systolic array synthesis: Computability and time cones
[AD-A189697] N87-12267
CONSTRUCTION
Advanced construction procedures: Confined bases for airport pavements
[FAA/PM-86/9] N87-11799
CONTAMINANTS
Organics in water contamination analyzer, phase 1
[NASA-CR-179901] N87-12060
CONTINGENCY
Controlling outliers in contingent valuation experiments
[PB86-210485] N87-12299
CONTINUOUS WAVE LASERS
Laser based information systems (selected pages)
[AD-A188418] N87-11968
CONTINUUM MECHANICS
Fundamental study of dense-fluid detonation
[AD-A188753] N87-11906
CONTOURS
A computational theory of 3D shape reconstruction from image contours N87-12225
Determining displacement fields along contours from image sequences N87-12231
Contour line region segmentation N87-12240
CONTRACTS
National aeronautical R and D goals: Technology for America's future
[PB86-209772] N87-12405
CONTROL MOMENT GYROSCOPES
Large wheel actuators definition study — spacecraft control
[TELDIX-15-020-880] N87-11834
CONTROL STABILITY
Flight test report of the NASA icing research airplane: Performance, stability, and control after flight through natural icing conditions
[NASA-CR-179515] N87-11797
CONTROL SYSTEMS DESIGN
Aircraft automatic-flight-control system with inversion of the model in the feed-forward path using a Newton-Raphson technique for the inversion
[NASA-TM-88209] N87-11798
Design of a control system for a cryogenic wind tunnel optimizing a vector performance index
[ESA-TT-985] N87-11804
Qualitative results for distributed systems with discrete and stiffness with application to control
[AD-A188622] N87-11829
Control of a servomechanism for an elastic beam
[REPT-065.1708/86-0] N87-11956
CONTROL THEORY
Qualitative results for distributed systems with discrete and stiffness with application to control
[AD-A188622] N87-11829
Analysis and regulation of nonlinear and generalized linear systems
[AD-A188615] N87-12284
CONTROLLERS
Tradeoff methods in multiobjective insensitive design of airplane control systems N87-11730
Application of optimization techniques to the design of a flutter suppression control law for the DAST ARW-2 N87-11736
Eigenvalue assignment strategies in rotor systems
[NASA-CR-179906] N87-12282
CONVECTION CURRENTS
Project CONDORS: Convective diffusion observed by remote sensors
[PB86-222221] N87-12079
CONVECTIVE FLOW
Nonlinear internal gravity wave propagation, saturation and absorption in the atmosphere
[AD-A170244] N87-12074
CONVECTIVE HEAT TRANSFER
Free convection heat transfer in the critical region of binary fluid mixtures
[DE86-009856] N87-11978

CONVERGENCE
Acta Aerodynamica Sinica (selected articles)
[AD-A168449] N87-11884
Convergence theorems of sampler processes with applications to image processing
[AD-A170256] N87-12306
CONVEXITY
Contribution to the study of nonconvex nondifferentiable optimization algorithms
[ETN-86-99403] N87-12296
COOL STARS
Chromospheric activity of cool giant stars
[NASA-CR-177184] N87-12510
COOLING
Topics in the theory of neutron star cooling
N87-12515
COPOLYMERS
Environmentally stable polymers and coatings for space application: CH-5, supplement 10
[NASA-CR-177181] N87-11890
COPPER SELENIDES
Optimization of p-CuInSe sub 2/n-CdZnS solar cells
[DE86-010700] N87-12052
CORONAL LOOPS
Simultaneous Solar Maximum Mission (SMM) and very large array observations of solar active regions
[NASA-CR-177187] N87-12522
CORONARY CIRCULATION
Human heart function in early hours and days of head-down tilt (echocardiographic data) N87-12112
CORRELATION
Relationship between the southern oscillation El Nino and rainfall in South America, Africa, India, Australia and New Zealand
[INPE-4005-PRE/986] N87-12039
CORRELATORS
Phase-only optical filter for use in an optical correlation system
[AD-D012398] N87-12343
CORROSION
Investigation of coating performance and corrosion of compressor components in the TF30-P-3 engine of F111C aircraft
[AD-A168907] N87-11792
Corrosion information and analysis: Corrosion and compatibility
[BMI-CIA-14] N87-11872
CORROSION RESISTANCE
Corrosion resistance of selected ceramic materials to sulfuric acid, report of investigations
[PB86-212354] N87-11901
CORROSION TESTS
Performance demonstration tests for detection of intergranular stress corrosion cracking
[TIB6-007894] N87-11888
CORTICOSTEROIDS
Stress and neuroendocrine regulation of immune responses
[AD-A168768] N87-12155
COSMIC DUST
Infrared imaging and photometry of Comet Giacobini-Zinner N87-12447
Infrared observations of planets N87-12459
Photometry of Comet Halley N87-12464
Interplanetary and interstellar dust N87-12488
International Halley Watch: Discipline specialists for near-nucleus studies N87-12495
COSMIC GASES
A research proposal on spectroscopy of gases and solids observed in the solar system N87-12489
International Halley Watch: Discipline specialists for near-nucleus studies N87-12495
Galaxy groups: Neutral hydrogen and dynamics
N87-12512
COSMIC PLASMA
International Halley Watch: Discipline specialists for large scale phenomena N87-12492
COSMONAUTS
Commentary, diagram of MIR station N87-11810
Star City: On the 25th anniversary of the cosmonaut training center N87-11811
Interview on medical program of 237-day flight
N87-11814
COST ANALYSIS
A dynamic model for airframe cost estimation
[AD-A168842] N87-11887
Academic science/engineering: R and D funds, fiscal year 1984 (detailed statistical tables)
[PB86-216017] N87-12382
COUNTING
Approximate counting. A Martingale approach
[AD-A170229] N87-12290
COVALENT BONDS
Expandable epoxy application
[AD-A168969] N87-11895
COVARIANCE
Information capacity of the mismatched Gaussian channel
[AD-A170256] N87-12305
CRACK INITIATION
Observation of the initiation and progression of damage in compressively loaded composite plates containing a cutout
[NASA-CR-179911] N87-12022
A wedge test for quantifying fully plastic fracture
[AD-A168607] N87-12023
Dugdale model for circumferential through-cracks in pipes loaded by bending
[AD-A170260] N87-12024
CRACK PROPAGATION
A check of crack propagation prediction models against test results generated under transport aircraft flight simulation loading
[NLR-TR-84005-U] N87-11782
Grain boundary oxidation and fatigue crack growth at elevated temperatures
[NASA-CR-179529] N87-11873
An automatic crack measuring system using the direct-current potential-difference method
[ARL-STRUC-R-419] N87-11982
The surface crack problem in an orthotropic plate under bending and tension
[NASA-CR-179892] N87-12020
Observation of the initiation and progression of damage in compressively loaded composite plates containing a cutout
[NASA-CR-179911] N87-12022
A wedge test for quantifying fully plastic fracture
[AD-A168607] N87-12023
CRACK TIPS
The role of damage-softened material behavior in the fracture of composites and adhesives
[NASA-CR-179640] N87-11846
CRACKING (FRACTURING)
A wedge test for quantifying fully plastic fracture
[AD-A168607] N87-12023
CRASHWORTHINESS
Crash dynamics program transport seat performance and cost benefit study
[DOT/FAA/CT-85/36] N87-11706
CROP GROWTH
Spectral characteristics and the extent of paleosols of the Paluxy formation
[NASA-CR-179727] N87-12034
CROP IDENTIFICATION
TM band combination for crop discrimination
[INPE-3905-PRE/946] N87-12031
CROSS CORRELATION
A new cross-correlation method to derive shifts from stellar spectra
[REPT-65-38] N87-12499
CRYOGENIC FLUIDS
Losses in fountain-effect pumps
[NASA-TM-88232] N87-11965
CRYOGENIC WIND TUNNELS
A description of the active and passive sidewall-boundary-layer removal systems of the 0.3-meter transonic cryogenic tunnel
[NASA-TM-87764] N87-11801
Design of a control system for a cryogenic wind tunnel optimizing a vector performance index
[ESA-TT-965] N87-11804
CRYOPUMPING
High throughput continuous cryopump
[DE86-010629] N87-12000
CRYSTAL DEFECTS
Deep-level transient spectroscopy studies of gallium arsenide - aluminum gallium arsenide heterostructures and superlattices
[AD-A168328] N87-12361
CRYSTAL GROWTH
Zone leveling and solution growth of complex compound semiconductors in space
[NASA-CR-179884] N87-12358
High speed compound semiconductor devices in layered structures
[AD-A168866] N87-12366
Preparation and investigation of amorphous gallium arsenide films
[AD-A168907] N87-12369
CRYSTAL LATTICES
Deep-level transient spectroscopy studies of gallium arsenide - aluminum gallium arsenide heterostructures and superlattices
[AD-A168328] N87-12361
CRYSTAL STRUCTURE
Geometric structure, pseudo band gaps, and surface vibrational resonances on metal surfaces
[AD-A168291] N87-11876
Development/Applications of FT-IR ATR (Fourier Transform IR Attenuated Total Internal Reflection) and photoacoustic dichroism techniques for structural characterization of polymer surfaces
[AD-A168519] N87-11894
Synthesis and crystal and molecular structure of In(C5Me5)-An apparent octahedral cluster
[AD-A168281] N87-12360
Surface vibrations and (2x1) superstructures on FCC(110) metal surfaces
[AD-A168788] N87-12367
CRYSTALLOGRAPHY
Mechanical properties of various alloys in hydrogen
[NASA-CR-178874] N87-11889
CUBICS (MATHEMATICS)
Applications of world projections N87-12190
CURING
Molecular characteristics of thermoplastic polyimides as functions different cure cycles
[FOA-C-20603-F9] N87-11898
CURVE FITTING
Application of the key curve and multi-specimen techniques to dynamic J-R curve testing of alloy steel
[TIB6-001252] N87-11887
CUSPS
Stretched cusps in coupler curves: Four-bar linkages having Bali-model coupler points
[EUT-84-W-001] N87-12008
CYCLIC COMPOUNDS
Synthesis and crystal and molecular structure of In(C5Me5)-An apparent octahedral cluster
[AD-A168281] N87-12360
CYCLONES
Mariners Weather Log, volume 30, number 2, spring 1986
[PB86-213360] N87-12023
The direct and indirect effects of latent heat release on extratropical cyclone development N87-12097
CYCLOTRON RESONANCE DEVICES
RF field profiles in weakly irregular open resonators
[INPE-3957-PRE/975] N87-11938
Millimeter wave generation by relativistic electron beams
[AD-A168624] N87-12352
CYLINDRICAL BODIES
Vortex shedding of a square cylinder in front of a slender airfoil at high Reynolds numbers. Part 2: Compressibility effect
[MPIS-24/1985] N87-11704
Modeling of explosions: Fragmentation
[INPE-4022-NTE/264] N87-11989
Technology development for small high speed, mainshaft roller bearings
[AD-A168694] N87-11998
CYLINDRICAL PLASMAS
Theoretical behavior of fully ionized multiple species magnetized plasmas under rotation
[INPE-3915-RPE-510] N87-12349
CYLINDRICAL SHELLS
Dugdale model for circumferential through-cracks in pipes loaded by bending
[AD-A170260] N87-12024
A thin cylinder problem
[AD-A168665] N87-12251
CYTOPLASM
Functional state of somatotropic cells of adenohypophysis in hypokinetic rats N87-12140

D

DAMAGE
A conceptual basis for the design of damage-tolerant structural systems N87-11773
DAMAGE ASSESSMENT
Derivation of damage functions for atmospheric degradation of materials
[PB86-213236] N87-11911
DAMPING
Analytical investigation of the dynamics of tethered constellations in Earth orbit, phase 2
[NASA-CR-178953] N87-11915
Studies on the dynamic mechanical properties of the composite modified double-base propellant
[AD-A168799] N87-11907
DATA ACQUISITION
A small, flexible and powerful data acquisition system for the F16 aircraft
[NLR-MP-85074-U] N87-11786
Audiomagnetotelluric (AMT) system
[DE86-011274] N87-11986
Summary of control and data acquisition systems for Nova experiments
[DE86-010563] N87-11989

Design of a data acquisition and recording system for a resistance welder
[DE86-012214] N87-12001
Interpreting forest and grassland biome productivity utilizing nested scales of image resolution and biogeographical analysis
[NASA-CR-176803] N87-12029
A comparison of Stratospheric Aerosol and Gas Experiment 1 (SAGE 1) and Umkehr ozone profiles including a search for Umkehr aerosol effects
N87-12066
Publications of the Jet Propulsion Laboratory, 1984
[NASA-CR-179870] N87-12386
The observation and analysis of lunar occultations of stars with an emphasis on improvements to data acquisition instrumentation and reduction techniques
N87-12501

DATA BASE MANAGEMENT SYSTEMS
Computing covers for embedded functional dependencies — data base management
[REPT-86-006] N87-12393
Estimating bucket accesses: A practical approach — data base queries
[INF-85-18] N87-12394
Logical treatment of knowledge semantic integrity and organization in data base management systems
[ETN-86-98398] N87-12395
Extending a relational interface with recursion — expert systems; data base systems
[INF-86-10] N87-12396

DATA BASES
Practical considerations in aeroelastic design
N87-11720
Two-dimensional polygonal representation of maps for use with autonomous vehicle route planning
[AD-A170301] N87-12044
Inversion of ocean data
[AD-A168676] N87-12099
Dynamic grid manipulation for PDEs (Partial Differential Equations) on hypercube parallel processors
[AD-A168679] N87-12296
A user's guide to the socioeconomic environmental demographic information system (SEEDIS)
[AD-A169917] N87-12388
Army technology development. IBIS query. Software to support the Image Based Information System (IBIS) expansion for mapping, charting and geodesy
[AD-A169609] N87-12389

DATA FLOW ANALYSIS
LUSTRE: A data flow language for real time
[ETN-86-98400] N87-12262

DATA LINKS
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A168450] N87-11685
Data link isolater
[DIGEL-52] N87-11930

DATA MANAGEMENT
Optimization in the systems engineering process
N87-11719
Practical considerations in aeroelastic design
N87-11720
The inference machine laboratory: Graphic tools for knowledge management N87-12160
An editing model for generating graphical user interfaces N87-12188

DATA PROCESSING
Distribution system simulator
[NASA-CR-179918] N87-11940
Summary of control and data acquisition systems for Nova experiments
[DE86-010563] N87-11989
Development of data processing, interpretation and analysis system for remote sensing of trace atmospheric gas species
[NASA-CR-179882] N87-12059
Data processing and case study analysis of thunderstorm studies
[NASA-CR-179890] N87-12083
PS: A nonprocedural language with data types and modules
[NASA-CR-178196] N87-12248

DATA RECORDERS
A solid state data recorder for space-based applications using magnetic bubble memory
[AD-A169609] N87-11984

DATA RECORDING
A solid state data recorder for space-based applications using magnetic bubble memory
[AD-A169609] N87-11984

DATA REDUCTION
Audiomagnetotelluric (AMT) system
[DE86-011274] N87-11986
Design of a data acquisition and recording system for a resistance welder
[DE86-012214] N87-12001
Development of data processing, interpretation and analysis system for remote sensing of trace atmospheric gas species
[NASA-CR-179882] N87-12059
The observation and analysis of lunar occultations of stars with an emphasis on improvements to data acquisition instrumentation and reduction techniques
N87-12501

DATA STORAGE
Feasibility study in wall-coded magnetic bubble memory devices
[BR99249] N87-12169
Optics '86: Four Western European Countries Review Recent Achievements
[AD-A170262] N87-12344

DATA SYSTEMS
The role of optimization in structural model refinement
N87-11724

DATA TRANSMISSION
METEOSAT raw image data encryption
[ESA-CR(P)-2234] N87-11932
Laser based information systems (selected pages)
[AD-A168418] N87-11988

DECIMETER WAVES
Low level decimetric (1.6 GHz) solar burst activity
[INPE-4004-PRE/997] N87-12524

DECISION MAKING
Optimization in the systems engineering process
N87-11719
Influence of analysis and design models on minimum weight design N87-11739
Multidisciplinary systems optimization by linear decomposition N87-11740
Approximate evaluation of reliability and availability via perturbation analysis
[AD-A169561] N87-12014
Extended analysis of the structure of error scores in psychological aptitude tests
[ESA-TT-943] N87-12163
Generalized network implementations
[AD-A168298] N87-12266
Federal government information technology: Management, security and congressional oversight
[PB86-205499] N87-12397

DECISION THEORY
On the elementary theorems of decision theory
[AD-A170285] N87-12385

DEEP SPACE
Theoretical and observational planetary physics
N87-12415
A survey of nearby stars for the perturbative effects of extrasolar planetary systems N87-12482
The radial velocity search for extrasolar planets
N87-12485

DEEP SPACE NETWORK
Design optimization of the 34-meter DSN-NCP antennas N87-11763
Publications of the Jet Propulsion Laboratory, 1984
[NASA-CR-179870] N87-12386

DEFENSE PROGRAM
SDI (Strategic Defense Initiative) Program: Evaluation of DOE's (Department of Energy's) answers to questions on X-ray laser experiment, briefing report
[PB86-209236] N87-11808

DEFLECTION
Calculated effects of varying Reynolds Number and dynamic pressure on flexible wings at transonic speeds
N87-11738
Vertical deflection characteristics of aircraft tyres
[ESDU-86005] N87-11992

DEGRADATION
High performance liquid chromatography of propellants. Part 1: Analysis of M1, M6, and M10 propellants
[AD-A168206] N87-11903
Derivation of damage functions for atmospheric degradation of materials
[PB86-213238] N87-11911
Rain effects on radio frequency propagation
[AD-A168342] N87-11920

DEHYDRATED FOOD
Effect of long-term storage on some parameters of fat ingredient of freeze-dried products N87-12118
Biological value of proteins in food allowance of Salyut orbital station crews N87-12135

DEICING
Ground aircraft deicing technology review
[DOT/FAA/CT-85/21] N87-11707

DELAMINATING
An in-situ study in SEM of delamination in several graphite/epoxy composite material systems
[NASA-CR-179839] N87-11847

DELTA LAUNCH VEHICLE
Delta launch vehicle accident investigation
[GPO-83-141] N87-11820

DEMOGRAPHY
A research planning assessment for applications of artificial intelligence in manufacturing
[AD-A168692] N87-12252
A user's guide to the socioeconomic environmental demographic information system (SEEDIS)
[AD-A169917] N87-12388

DENSITY (NUMBER/VOLUME)
Density of states due to pairing of impurities in semiconductor systems
[INPE-4009-PRE/1001] N87-12558

DENSITY DISTRIBUTION
Voyager microwave scintillation measurements of solar wind plasma parameters N87-12526

DENSITY MEASUREMENT
Investigation of the external flow analysis for density measurements at high altitude
[NASA-CR-172464] N87-11695

DENSITY WAVE MODEL
The evolution of active galactic nuclei N87-12518

DEPOSITION
Investigation on acidity-forming ions in wet and dry deposition during the winter season 1984/85
[DFVLR-FB-86-15] N87-12062

DEPOSITS
Investigation of coating performance and corrosion of compressor components in the TF30-P-3 engine of F111C aircraft
[AD-A168602] N87-11792

DESCENT TRAJECTORIES
Calculation of water drop trajectories to and about arbitrary three-dimensional lifting and nonlifting bodies in potential airflow
[NASA-CR-3935] N87-11694

DESERTIFICATION
Environmental processes and spectral reflectance characteristics associated with soil erosion in desert fringe regions
[NASA-CR-179729] N87-12036

DESIGN ANALYSIS
Recent Experiences in Multidisciplinary Analysis and Optimization, part 1
[NASA-CP-2327-PT-1] N87-11717
Structural synthesis: Precursor and catalyst
N87-11718
Application of optimization techniques to vehicle design: A review N87-11726
Structural Optimization in automotive design
N87-11729
A nonlinear programming method for system design with results that have been implemented N87-11736
Structural sensitivity analysis: Methods, applications, and needs N87-11741
The ADS general-purpose optimization program
N87-11744
Regression analysis as a design optimization tool
N87-11754
Computer aided analysis and optimization of mechanical system dynamics N87-11778
Multidisciplinary approach to the design of high pressure oxygen systems N87-11790
Advanced SAR study — satellite-borne radar
[BLS-6345] N87-11931
Proposition of a design methodology for integrated communication circuits. Implementation of a circuit for the FIP local network
[ETN-86-98399] N87-11934
Performance and design of composite beams with web openings
[PB86-213105] N87-12027
Progress in calculation methods for eigenfrequencies
[IW-M505] N87-12068
Definition, study and design of a specific self-checking microprocessor COBRA
[ETN-86-98402] N87-12173
Design study of a push-broom imager for the thermal infrared
[MATRA-094/PH/UB/137.85] N87-12348

DETECTION
Reliable welding of HSLA steels by square wave pulsing using an advanced sensing (EDAP) technique
[AD-A168762] N87-11997
Detection, identification, and settling of bacteria from an aerosol; testing of a detector for aerosols with bacteria and preliminary investigation of settling on different surface materials
[FOA-C-40229-B2] N87-12103
Development of vision tests for air-to-air target detection
[AD-A168309] N87-12161

DETONABLE GAS MIXTURES
Safety aspects of large-scale combustion of hydrogen
[DE86-007375] N87-11984

DETONATION WAVES
Fundamental study of dense-fluid detonation
[AD-A168753] N87-11908

DEUTERIUM
Influence of displacement damage on deuterium permeation in 316 stainless steel
[DE86-010463] N87-11881
DIAPHRAGM (ANATOMY)
Skeletal muscle fatigue: Physiological and biochemical studies N87-12159
DICHROISM
Development/Applications of FT-IR ATR (Fourier Transform IR Attenuated Total Internal Reflection) and photoacoustic dichroism techniques for structural characterization of polymer surfaces
[AD-A166519] N87-11894
DIELECTRIC PROPERTIES
Raman determination of molecular structure and physical properties of dielectric coatings
[DE86-011620] N87-11897
Techniques for microwave dielectric measurements
[AD-A166300] N87-11919
DIELECTRICS
Interfacial properties of germanium nitride dielectric layers in germanium
[AD-A166332] N87-12362
DIESEL ENGINES
Compound cycle engine program
[NASA-TM-88879] N87-11790
DIETS
Human blood free amino acids at early stage of head-down tilt N87-12113
DIFFERENTIAL EQUATIONS
Numerical methods for the solution of ordinary differential equations: Initial value problems
[ESDU-86011] N87-12280
Error estimates for differential-algebraic equations
[DE86-012492] N87-12291
On realization of nonlinear systems described by higher-order differential equations
[MEMO-569] N87-12297
Reduction of the general Spitzer-Haerm problem in plasma physics
[INPE-3978-PRE/989] N87-12348
DIFFRACTION
Electromagnetic backscattering by corner reflectors
[NASA-CR-179809] N87-11914
DIFFRACTION LIMITED CAMERAS
High resolution imaging N87-12416
DIFFUSION
Investigation of coating performance and corrosion of compressor components in the TF30-P-3 engine of F111C aircraft
[AD-A166802] N87-11792
An alternate method for determining atmospheric stability N87-12061
Interfacial reactions between amorphous W-51 thin films and polycrystalline overlayers
[DE86-006959] N87-12372
DIFFUSION ELECTRODES
High-efficiency, thin-film, cadmium chalcogenide photoelectrochemical cell with in situ storage
[DE86-004451] N87-11945
DIGITAL DATA
LANDSAT-D program. Volume 2: Ground segment
[NASA-CR-177174] N87-12030
DIGITAL FILTERS
VLSI (Very Large Scale Integrated circuits) implementation of a quantized sinusoid filter algorithm and its use to compute the discrete Fourier transform, part 2
[AD-A166605] N87-11942
DIGITAL RADAR SYSTEMS
Mode S beacon system: Functional description
[DOT/FAA/PM-85/19] N87-11715
DIGITAL SIMULATION
Distribution system simulator
[NASA-CR-179918] N87-11940
WEST-3 wind turbine simulator development
[NASA-CR-174963] N87-12046
DIGITAL SYSTEMS
GRIDNET: A highly survivable digital communications network, phase 1
[PB86-203015] N87-11936
A solid state data recorder for space-based applications using magnetic bubble memory
[AD-A166909] N87-11964
TM band combination for crop discrimination
[INPE-3905-PRE/946] N87-12031
Dynamic bar pattern method
[AD-D012383] N87-12342
DIGITAL TECHNIQUES
A context based technique for smoothing of digital thematic maps N87-12219
DIHEDRAL ANGLE
Electromagnetic backscattering by corner reflectors
[NASA-CR-179809] N87-11914
DIMENSIONAL ANALYSIS
Classification of weakly infinite-dimensional spaces and essential mappings
[REPT-269] N87-12317
DIMENSIONAL MEASUREMENT
An automatic crack measuring system using the direct-current potential-difference method
[ARL-STRUC-R-419] N87-11962
DIRAC EQUATION
Stochastic mechanics of a Dirac particle in two space-time dimensions
[PREPRINT-474] N87-12381
DIRECT CURRENT
Utility-interactive inverter using the dc current-source approach
[DE86-012135] N87-11952
An automatic crack measuring system using the direct-current potential-difference method
[ARL-STRUC-R-419] N87-11962
DISCONTINUITY
Semiconductor superlattice photodetectors
[NASA-CR-179850] N87-12355
DISCRETE FUNCTIONS
Discretizations for multigrid methods
[TUM-I8519] N87-12278
M-estimation for discrete data: Asymptotic distribution theory and implications
[AD-A166532] N87-12283
DFR (Decreasing Failure Rate) property of first passage times and its preservation under geometric compounding
[AD-A166571] N87-12304
DISEASES
Carbon dioxide increase and human health: Data and research requirements for determining consequences (including a bibliography for additional reading)
[DE86-012760] N87-12156
DISPENSERS
Automated tape laying machine for composite structures
[AD-D012366] N87-11851
DISPLACEMENT
Influence of displacement damage on deuterium permeation in 316 stainless steel
[DE86-010463] N87-11881
A wedge test for quantifying fully plastic fracture
[AD-A166607] N87-12023
DISPLAY DEVICES
Psychophysiological aspects of color-coding of flight and navigation information on onboard electronic displays N87-12127
A helicopter flight evaluation of kinesthetic-tactual displays
[AD-A166302] N87-12167
Profiling graphic display systems N87-12183
Automatic generation of graphical user interfaces N87-12187
Dynamic bar pattern method
[AD-D012383] N87-12342
DISTRIBUTED PARAMETER SYSTEMS
Qualitative results for distributed systems with discrete and stiffness with application to control
[AD-A166622] N87-11829
DISTRIBUTED PROCESSING
The application of a sparse, distributed memory to the detection, identification and manipulation of physical objects
[NASA-TM-89231] N87-12169
The implementation and use of Ada on distributed systems with high reliability requirements
[NASA-CR-179606] N87-12243
The implementation and use of Ada on distributed systems with high reliability requirements
[NASA-CR-179642] N87-12265
A network architecture for data-driven systems
[AD-A166764] N87-12267
DISTRIBUTION FUNCTIONS
Radon optical processing in radon space
[AD-A166612] N87-11943
Reduction of the general Spitzer-Haerm problem in plasma physics
[INPE-3978-PRE/989] N87-12348
DIURNAL VARIATIONS
World atlas of total sky-cover: Environmental research papers
[AD-A170474] N87-12090
DOCUMENT STORAGE
Using optical disk as the storage media device for the master personnel files
[AD-A166390] N87-12367
DOCUMENTS
FAA helicopter/heliport research, engineering, and development bibliography, 1964-1986
[FAA/PM-86/47] N87-11798
DOLOMITE (MINERAL)
Geochemistry and origin of regional dolomites
[DE86-012768] N87-12077
DOMAINS
Mathematical morphology applied to range image processing N87-12222
DOPPLER EFFECT
HF (High Frequency) absolute time of arrival sensing
[AD-A166275] N87-11917
Sodar, rawinsonde and surface layer measurements at a coastal site. Part 2: SCCCAMP (South Central Coast Aerometric Monitoring Project) data report
[AD-A166833] N87-12073
X-ray studies of BL lacertae objects N87-12506
Large-scale structure and dynamics of solar active regions observed in the far ultraviolet N87-12527
DOPPLER RADAR
Wind profiling of stormy and quiescent atmospheres with microwave radars
[PB86-212545] N87-12094
DRAG MEASUREMENT
Lift and drag measurements on a towing tank model of a tip vane turbine
[IW-R512] N87-11990
DROPS (LIQUIDS)
Calculation of water drop trajectories to and about arbitrary three-dimensional lifting and nonlifting bodies in potential airflow
[NASA-CR-3935] N87-11894
DROUGHT
Environmental processes and spectral reflectance characteristics associated with soil erosion in desert fringe regions
[NASA-CR-179729] N87-12006
DUCTED FLOW
Surface-search radar performance in the evaporation duct: Global predictions, Revision A
[AD-A166831] N87-11922
DUCTILITY
A wedge test for quantifying fully plastic fracture
[AD-A166607] N87-12023
DUNES
Environmental processes and spectral reflectance characteristics associated with soil erosion in desert fringe regions
[NASA-CR-179729] N87-12006
DYE LASERS
A study of laser induced ionization of alkali metal vapours based on saturation of the first resonance transition
[UTIS-299] N87-11987
DYNAMIC CHARACTERISTICS
A dynamic model for airframe cost estimation
[AD-A166842] N87-11667
Crash dynamics program transport seat performance and cost benefit study
[DOT/FAA/CT-85/36] N87-11708
Studies on the dynamic mechanical properties of the composite modified double-base propellant
[AD-A166799] N87-11907
Dynamic grid manipulation for PDEs (Partial Differential Equations) on hypercube parallel processors
[AD-A166679] N87-12286
DYNAMIC CONTROL
Analytical investigation of the dynamics of tethered constellations in Earth orbit, phase 2
[NASA-CR-179953] N87-11815
Near-real-time control of human figure models N87-12196
DYNAMIC MODELS
Component testing for dynamic model verification N87-11765
DYNAMIC RESPONSE
Analytical investigation of the dynamics of tethered constellations in Earth orbit, phase 2
[NASA-CR-179953] N87-11815
Qualitative results for distributed systems with discrete and stiffness with application to control
[AD-A166622] N87-11829
Verifying strain gage installations for dynamic tests
[DE86-006489] N87-11985
DYNAMIC STRUCTURAL ANALYSIS
Shape optimization including finite element grid adaptation N87-11779
A study of large space structures
[LR46869] N87-11832
DYNAMIC TESTS
Verifying strain gage installations for dynamic tests
[DE86-006489] N87-11985

E

EARTH (PLANET)
Applications of world projections N87-12193
EARTH ATMOSPHERE
Microwave emission and scattering from Earth surface and atmosphere
[NASA-CR-177169] N87-12068

EARTH OBSERVATIONS (FROM SPACE)
Satellite tracking and observability
[AD-A168394] N87-11818
The Brazilian satellite remote sensing
[INPE-4006-PRE/999] N87-12040
EARTH ORBITAL ENVIRONMENTS
Analytical investigation of the dynamics of tethered constellations in Earth orbit, phase 2
[NASA-CR-179953] N87-11815
EARTH ROTATION
The Earth's nutational motion determined from radio interferometry N87-12518
EARTH SURFACE
Satellite tracking and observability
[AD-A168394] N87-11818
Microwave emission and scattering from Earth surface and atmosphere
[NASA-CR-177189] N87-12068
ECHOCARDIOGRAPHY
Human heart function in early hours and days of head-down tilt (echocardiographic data) N87-12112
ECOLOGY
An ecologic study of peat landforms in Canada and Alaska
[NASA-CR-179740] N87-12033
ECONOMIC ANALYSIS
A user's guide to the socioeconomic environmental demographic information system (SEEDIS)
[AD-A168917] N87-12388
ECOSYSTEMS
Interpreting forest and grassland biome productivity utilizing nested scales of image resolution and biogeographical analysis
[NASA-CR-176803] N87-12029
EDGES
Edge-only matching techniques in robot vision N87-12232
EDITING ROUTINES (COMPUTERS)
An editing model for generating graphical user interfaces N87-12186
VIRYA: A motion control editor for kinematic and dynamic animation N87-12197
Eliminating the dichotomy between scripting and interaction N87-12206
SMP: A solid modeling program version 2.0
[NASA-CR-178183] N87-12244
MENTOR user manual — editor
[INF-85-15] N87-12259
EDUCATION
Learning graphics programming by direct communication N87-12204
A method of learning rules from uncertain data applied to the computer vision problem N87-12233
Methodological approach to the 1984 new entrants survey
[PB86-212305] N87-12383
EFFICIENCY
Losses in fountain-effect pumps
[NASA-TM-88232] N87-11965
EGGS
Investigation of viability of quail embryos and chicks when eggs are exposed to gamma radiation and vibration as related to different terms of egg storage N87-12119
EGYPT
Environmental processes and spectral reflectance characteristics associated with soil erosion in desert fringe regions
[NASA-CR-179729] N87-12036
EIGENVALUES
Model analysis of robots
[WPB-0144] N87-12007
Sensitivity analysis and approximation methods for general eigenvalue problems
[NASA-CR-179538] N87-12021
Progress in calculation methods for eigenfrequencies
[IW-M505] N87-12058
Eigenvalue assignment strategies in rotor systems
[NASA-CR-179906] N87-12282
Asymptotic distributions of functions of the eigenvalues of the sample covariance matrix and canonical correlation matrix in multivariate time series
[AD-A170282] N87-12308
EINSTEIN EQUATIONS
The 1915 epistolary controversy between A. Einstein and T. Levi-Civita
[PREPRINT-472] N87-12380
EL NINO
Relationship between the southern oscillation El Nino and rainfall in South America, Africa, India, Australia and New Zealand
[INPE-4005-PRE/998] N87-12039
Mariners Weather Log, volume 30, number 2, spring 1986
[PB88-213380] N87-12093
ELASTIC BODIES
Control of a servomechanism for an elastic beam
[REPT-065.1708/86-0] N87-11956
ELASTIC PROPERTIES
The elastic constants of NiAl to 1.4 GPa
[AD-A168813] N87-11879
The surface crack problem in an orthotropic plate under bending and tension
[NASA-CR-179892] N87-12020
ELASTIC SCATTERING
Multichannel nonpotential scattering theory
[PREPRINT-476] N87-12333
ELASTOMERS
The effect of high pressure on electrical relaxation in PPO and electrical conductivity in PPO complexed with lithium salts
[AD-A168894] N87-11862
ELECTRIC BATTERIES
Studies of high reliability long-life Li/SO sub 2 cells
[DE86-010479] N87-11947
ELECTRIC CONTROL
Control of wind power stations with variable velocity in a large range
[FOA-C-20613-E3] N87-12056
ELECTRIC CURRENT
Use of central electroanalgesia for functional recovery from motion sickness N87-12134
Electron tunneling microscopy
[AD-A168234] N87-12359
ELECTRIC DISCHARGES
Atmospheric electrical modeling in support of the NASA F106 Storm Hazards Project
[NASA-CR-179801] N87-12082
ELECTRIC EQUIPMENT TESTS
Performance characteristics of a GEC servoamplifier and permanent magnet electric motor
[LR48720] N87-11954
ELECTRIC GENERATORS
Integrated natural gas engine cooling jacket vapor compressor program, phase 1A
[PB86-215682] N87-12009
ELECTRIC POTENTIAL
Static series voltage margin of I2L — transistors
[REPT-8550] N87-11955
ELECTRIC POWER SUPPLIES
Arctic communications techniques: Remote unattended power systems
[AD-A168289] N87-11918
Control of radio frequency interference in high frequency switched mode power supplies — weapon systems
[BAE-BT-15600] N87-11929
ELECTRIC POWER TRANSMISSION
Power system applications of fiber optic sensors
[NASA-CR-179921] N87-12337
ELECTRIC WELDING
Design of a data acquisition and recording system for a resistance welder
[DE86-012214] N87-12001
ELECTRICAL FAULTS
Statistical distributions of breakdown voltages in a high current spark gap
[DE86-012281] N87-11950
ELECTRICAL GROUNDING
Practical considerations of the topological approach to electromagnetic interference control
[AD-A168518] N87-11921
ELECTRICAL RESISTIVITY
Simultaneous electrical resistivity and mass uptake measurements in bromine intercalated fibers
[NASA-TM-88900] N87-11841
The effect of high pressure on electrical relaxation in PPO and electrical conductivity in PPO complexed with lithium salts
[AD-A168894] N87-11862
ELECTRO-OPTICS
Electro-optical control of solid fuel rocket burn rate
[AD-D012397] N87-11839
Optics '86: Four Western European Countries Review Recent Achievements
[AD-A170262] N87-12344
Research on materials and components for opto-electronic signal processing
[AD-A168751] N87-12365
ELECTROCATALYSTS
Structure and activity of Pt-Co alloys as oxygen reduction electrocatalysts
[DE86-012831] N87-11867
ELECTROCHEMICAL CELLS
High-efficiency, thin-film, cadmium chalcogenide photoelectrochemical cell with in situ storage
[DE86-004451] N87-11945
ELECTROCHEMISTRY
Electrochemical investigation of lithium/potassium carbonate eutectic for application in modeling the molten carbonate fuel cell cathode
[DE86-001087] N87-11944
Electrochemical effects on weld pool chemistry in submerged arc and dc electroslag welding
[DE86-012117] N87-12003
ELECTRODE MATERIALS
Structure and activity of Pt-Co alloys as oxygen reduction electrocatalysts
[DE86-012831] N87-11867
Research on materials related to the sodium heat engine
[DE86-012833] N87-12004
ELECTRODEPOSITION
Density of states at mid gap in hydrogenated amorphous silicon
[DE86-011403] N87-12373
ELECTRODES
Research on materials related to the sodium heat engine
[DE86-012833] N87-12004
ELECTROENCEPHALOGRAPHY
Temporal tuning effects in the visually evoked response
[AD-A168219] N87-12149
ELECTROLUMINESCENCE
Electroluminescent (EL) remotely-controlled landing zone marker light system
[AD-D012368] N87-11716
ELECTROLYTE METABOLISM
Mathematical models of fluid-electrolyte metabolism N87-12106
ELECTROMAGNETIC COMPATIBILITY
Practical considerations of the topological approach to electromagnetic interference control
[AD-A168518] N87-11921
ELECTROMAGNETIC FIELDS
X-ray studies of BL lacertae objects N87-12506
ELECTROMAGNETIC INTERFERENCE
Practical considerations of the topological approach to electromagnetic interference control
[AD-A168518] N87-11921
ELECTROMAGNETIC RADIATION
Optical phase conjugation via four-wave mixing in barium titanate
[AD-A168908] N87-12341
ELECTROMAGNETIC SHIELDING
Practical considerations of the topological approach to electromagnetic interference control
[AD-A168518] N87-11921
ELECTROMAGNETIC WAVE TRANSMISSION
Rain effects on radio frequency propagation
[AD-A168342] N87-11920
ELECTRON BEAMS
High energy electron radiation degradation of gallium arsenide solar cells
[AD-A168402] N87-12050
ELECTRON DENSITY (CONCENTRATION)
A study of laser induced ionization of alkali metal vapours based on saturation of the first resonance transition
[UTIS-299] N87-11987
ELECTRON DENSITY PROFILES
Density of states at mid gap in hydrogenated amorphous silicon
[DE86-011403] N87-12373
ELECTRON DIFFRACTION
Surface vibrations and (2x1) superstructures on FCC(110) metal surfaces
[AD-A168788] N87-12367
ELECTRON ENERGY
Geometric structure, pseudo band gaps, and surface vibrational resonances on metal surfaces
[AD-A168291] N87-11876
Surface vibrations and (2x1) superstructures on FCC(110) metal surfaces
[AD-A168788] N87-12367
ELECTRON GUNS
Thermionic Cathode Project
[AD-A168589] N87-11941
Development of Traveling Wave Tube (TWT) transmitter amplifier for communication satellites 60 GHz/10 W
[BMFT-FB-W-85-030] N87-11953
ELECTRON IRRADIATION
High energy electron radiation degradation of gallium arsenide solar cells
[AD-A168402] N87-12050
ELECTRON MICROSCOPY
Electron tunneling microscopy
[AD-A168234] N87-12359
ELECTRON STATES
Calculation of potential energy surfaces for HCO and HNO using many-body methods
[AD-A169611] N87-11983
ELECTRON TUNNELING
Semiconductor superlattice photodetectors
[NASA-CR-179850] N87-12355
Electron tunneling microscopy
[AD-A168234] N87-12359

Tunneling in one dimension: General theory, instabilities, rules of calculation, applications — quantum mechanics
[PREPRINT-475] N87-12374

ELECTRONIC EQUIPMENT TESTS
Measurement of radiation intensity at the solar tower plant SSPS/CRS of the IEA in Spain
[ESA-TT-861] N87-12065

ELECTRONIC PACKAGING
Thermal analysis of radiometer containers for the 122m hoop column antenna concept
[NASA-TM-89025] N87-11986

ELECTROPHYSIOLOGY
Temporal tuning effects in the visually evoked response
[AD-A168219] N87-12149

ELECTROSLAG WELDING
Electrochemical effects on weld pool chemistry in submerged arc and dc electroslag welding
[DE86-012117] N87-12003

ELECTROSTATICS
Application of program POISSON to axially-symmetric problems - magnetostatic and electrostatic - with use of a prolate spheroidal boundary
[DE86-012926] N87-12256

ELEMENTARY PARTICLE INTERACTIONS
Multichannel nonpotential scattering theory
[PREPRINT-476] N87-12333

ELLIPTIC DIFFERENTIAL EQUATIONS
Transformation of two and three-dimensional regions by elliptic systems
[NASA-CR-179861] N87-12281

EMBEDDED COMPUTER SYSTEMS
Research in very high performance computing: Policy recommendation and research requirements statement
[PB86-209723] N87-12174
The implementation and use of Ada on distributed systems with high reliability requirements
[NASA-CR-179806] N87-12243
The implementation and use of Ada on distributed systems with high reliability requirements
[NASA-CR-179842] N87-12265

EMBRYOS
Investigation of viability of quail embryos and chicks when eggs are exposed to gamma radiation and vibration as related to different terms of egg storage N87-12119

EMISSION SPECTRA
Kinetic and spectroscopic studies of chemical intermediates at both high and low temperatures
[AD-A168758] N87-11861
Chromospheric activity of cool giant stars
[NASA-CR-177184] N87-12510
The emission lines from accretion disks in cataclysmic variable systems N87-12513

ENDOCRINE SYSTEMS
Endocrine status of cosmonauts following long-term space missions N87-12146

ENDOLYMPH
Mathematical model of cupuloendolymphatic system with different cupula and endolymph densities — semicircular canals N87-12123

ENDOTOXINS
Paramecium test for toxic substances in human blood during simulated weightlessness N87-12115

ENERGY BUDGETS
A study of the radiation balance of the Amazon Forest
[INPE-3956-PRE/974] N87-12061

ENERGY CONSERVATION
Distribution system simulator
[NASA-CR-179918] N87-11940
Numerical hydrodynamic models of planetary nebulae N87-12517

ENERGY CONVERSION
Summary assessment of solar thermal parabolic dish technology for electrical power generation
[NASA-CR-179920] N87-12049
Photovoltaic technology evaluation
[DE86-010467] N87-12053

ENERGY CONVERSION EFFICIENCY
Results of the 1986 NASA/JPL Balloon Flight Solar Calibration Program
[NASA-CR-179916] N87-12048

ENERGY LEVELS
Density of states at mid gap in hydrogenated amorphous silicon
[DE86-011403] N87-12373

ENERGY REQUIREMENTS
National Energy Software Center
[DE86-010515] N87-12391

ENERGY TECHNOLOGY
National Energy Software Center
[DE86-010515] N87-12391

ENERGY TRANSFER
Kinetic and spectroscopic studies of chemical intermediates at both high and low temperatures
[AD-A168758] N87-11861
Fundamental study of dense-fluid detonation
[AD-A168753] N87-11906

ENGINE CONTROL
Control of gas turbines. The future: Is a radical approach needed? — aircraft engines
[PNR-90295] N87-11793

ENGINE DESIGN
Optimization applications in aircraft engine design and test N87-11788
On optimal design for the blade-root/hub interface in jet engines N87-11789
Ceramic automotive Stirling engine program
[NASA-CR-175042] N87-12047

ENGINEERING MANAGEMENT
Methodological approach to the 1984 new entrants survey
[PB86-212305] N87-12383

ENGINES
Arctic communications techniques: Remote unattended power systems
[AD-A168289] N87-11918
Research on materials related to the sodium heat engine
[DE86-012833] N87-12004

ENGLISH LANGUAGE
Goal directed animation using English motion commands N87-12198

ENTHALPY
Heat capacity and enthalpy of liquids: Alkanes
[ESDU-86007] N87-12377

ENTRAINMENT
Improvement of mechanical model in the entrainment method for compressible turbulent boundary layer
[AD-A168451] N87-11970

ENTROPY
On the Maxwellian distribution, symmetric form, and entropy conservation for the Euler equations
[NASA-TP-2583] N87-11963

ENVIRONMENT EFFECTS
An ecologic study of peat landforms in Canada and Alaska
[NASA-CR-179740] N87-12033
A comparison of Stratospheric Aerosol and Gas Experiment 1 (SAGE 1) and Umkehr ozone profiles including a search for Umkehr aerosol effects N87-12066
Carbon dioxide increase and human health: Data and research requirements for determining consequences (including a bibliography for additional reading)
[DE86-012760] N87-12156

ENVIRONMENTAL MONITORING
Standard reference photometer network for verification and certification of ozone standards
[PB86-205465] N87-12064
Global atmospheric background monitoring for selected environmental parameters BAPMoN data for 1981. Volume 2: Precipitation chemistry, continuous atmospheric carbon dioxide and suspended particulate matter
[PB86-208360] N87-12065

ENVIRONMENTS
An application of multidimensional scaling to describe stress among naval helicopter pilots
[AD-A168367] N87-12162

ENZYME ACTIVITY
Blood serum enzyme activity in healthy man with simulation of effects of weightlessness N87-12114

EPOXY RESINS
Structural evaluation of high strain fiber and resin composite material systems
[AD-A170464] N87-11852

EQUATIONS OF MOTION
Linear and rotational acceleration of a 3D rigid body
[MED-INFO-SHEET-715] N87-12319

EQUATORIAL REGIONS
An equatorial scintillation model
[AD-A168723] N87-11924

EQUIPMENT SPECIFICATIONS
Local area networks: Characteristics, properties, and standardization
[SWA-85/193] N87-12271

ERROR ANALYSIS
Development of data processing, interpretation and analysis system for remote sensing of trace atmospheric gas species
[NASA-CR-179882] N87-12059
Preliminary estimates of radiosonde thermistor errors
[NASA-TP-2637] N87-12096
Extended analysis of the structure of error scores in psychological aptitude tests
[ESA-TT-943] N87-12163

ERROR DETECTION CODES
GRIDNET: A highly survivable digital communications network, phase 1
[PB86-203015] N87-11936

ERRORS
Pilot and static errors in steady level flight
[ESDU-86006] N87-11891
Error estimates for differential-algebraic equations
[DE86-012492] N87-12291

ESTIMATES
Error estimates for differential-algebraic equations
[DE86-012492] N87-12291

ETCHING
Submicrometer resolution etching of integrated circuit materials with laser-generated atomic fluorine
[ATR-85(8347)-1] N87-11909
Topical Meeting on Microphysics of Surfaces, Beams and Adsorbates held at Santa Fe, New Mexico on 4 - 8 February 1985
[AD-A168818] N87-12064

ETHERS
Polyimides containing oxyethylene units. Part 4: Polymerization of dianhydrides containing ether linkages
[NASA-TM-89257] N87-11891

ETHYLENEDIAMINE
Polyimides containing oxyethylene units. Part 4: Polymerization of dianhydrides containing ether linkages
[NASA-TM-89257] N87-11891

EULER EQUATIONS OF MOTION
On the Maxwellian distribution, symmetric form, and entropy conservation for the Euler equations
[NASA-TP-2583] N87-11963

EUROPA
Infrared observations of small solar-system bodies N87-12446

EUROPEAN SPACE AGENCY
Space activities of western Europe
[AD-A168424] N87-11907

EUROPEAN SPACE PROGRAMS
Space activities of western Europe
[AD-A168424] N87-11907

EUTECTIC ALLOYS
Electrochemical investigation of lithium/potassium carbonate eutectic for application in modeling the molten carbonate fuel cell cathode
[DE86-001067] N87-11944

EVALUATION
Evaluation of waterjet-machined metal matrix composite tensile specimens
[DE86-012254] N87-11854
Evaluation of wave calculations using GONO in the period October 1984 - April 1985
[KNMI-TR-79] N87-12102

EVAPORATION
Surface-search radar performance in the evaporation duct: Global predictions, Revision A
[AD-A168631] N87-11922

EVAPORATORS
Design of heat exchange element for plastic film heat exchanger
[DE86-011042] N87-11873

EVOKED RESPONSE (PSYCHOPHYSIOLOGY)
Temporal tuning effects in the visually evoked response
[AD-A168219] N87-12149

EXERCISE PHYSIOLOGY
In vivo nuclear magnetic resonance imaging
[NASA-CR-179902] N87-12305

EXHAUST NOZZLES
Pilot-pressure measurements in flow fields behind a rectangular nozzle with exhaust jet for free-stream Mach numbers of 0.00, 0.60, and 1.20
[NASA-TM-88990] N87-11886

EXOBIOLOGY
USSR report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, March - April 1986
[JPRS-USB-86-004] N87-12105

EXPERIMENT DESIGN
SDI (Strategic Defense Initiative) Program: Evaluation of DOE's (Department of Energy's) answers to questions on X-ray laser experiment, briefing report
[PB86-208236] N87-11908
Precision tests of the electroweak theory at the Z deg. — boson
[PREPRINT-494] N87-12332

EXPERT SYSTEMS
Active control of robot manipulator compliance
[NASA-CR-177183] N87-11994
Research in expert interactive cartographic systems
[AD-A168337] N87-12041
Kinematic and geometric modelling and animation of robots N87-12178
The inference machine laboratory: Graphic tools for knowledge management N87-12190
The interactive specification of human animation N87-12195
Goal directed animation using English motion commands N87-12198
A knowledge-based approach to computer vision systems N87-12215

Map/image congruency evaluation knowledge based system N87-12219
Incremental construction of 3-D models from a sequence of framed views: Matching partial objects N87-12223
A method of learning rules from uncertain data applied to the computer vision problem N87-12230
ELAND: An expert system for the configuration of local area networks: applications
[REPT-86-008] N87-12270
Selective backtracking
[INFE-3867-TDL/219] N87-12274
Topics in artificial intelligence
[INF-85-9] N87-12277
Extending a relational interface with recursion — expert systems; data base systems
[INF-86-10] N87-12396
EXPLOSIVE DEVICES
Modeling of explosions: Fragmentation
[INFE-4022-NTE/264] N87-11969
EXPLOSIVES
Mass spectrometric investigation of the thermal decomposition of several propellant and explosive ingredients
[AD-A168811] N87-11905
Fundamental study of dense-fluid detonation
[AD-A168753] N87-11906
EXTENSIONS
Matching extension in bipartite graphs. 1. Introduction and terminology
[AD-A168686] N87-12265
EXTINCTION
Analyses of the atmospheric aerosol extinction in the 0.5 to 14 micron region
[FOA-C-30396-E1,E3] N87-12091
EXTRAGALACTIC RADIO SOURCES
Variability studies of 3C 371 — extragalactic radio source
[NASA-CR-179772] N87-12406
EXTRAVEHICULAR ACTIVITY
Preliminary results of medical investigations during 5-month spaceflight aboard Salyut-7-Soyuz-T orbital complex N87-12109
The space station: Human factors and productivity
[NASA-CR-179905] N87-12166
Computer simulation of on-orbit manned maneuvering unit operations
[NASA-CR-179904] N87-12245
EXTRAVEHICULAR MOBILITY UNITS
Multidisciplinary approach to the design of high pressure oxygen systems N87-11780
EXTREME ULTRAVIOLET RADIATION
An XUV spectroscopic observation of the white dwarf star HZ 43 N87-12506
EXTREMELY HIGH FREQUENCIES
Techniques for microwave dielectric measurements
[AD-A168300] N87-11919
Rain effects on radio frequency propagation
[AD-A168342] N87-11920
EHF (Extremely High Frequency) telecommunications system engineering model
[PB86-214814] N87-11937
EYE MOVEMENTS
Distinctions of visual monitoring of instrument readings in maneuvered flight N87-12125

F

F REGION
An equatorial scintillation model
[AD-A168723] N87-11924
F-4 AIRCRAFT
A dynamic model for airframe cost estimation
[AD-A168842] N87-11687
F-16 AIRCRAFT
A small, flexible and powerful data acquisition system for the F16 aircraft
[NLR-MP-85074-U] N87-11786
F-27 AIRCRAFT
A check of crack propagation prediction models against test results generated under transport aircraft flight simulation loading
[NLR-TR-84005-U] N87-11782
FABRICATION
Audiomagnetotelluric (AMT) system
[DE86-011274] N87-11886
Fresnel lens study
[DE86-012249] N87-12046
FACTORIZATION
Application of viscous-inviscid interaction methods to transonic turbulent flows
[NASA-CR-179900] N87-11700
Some implications of dynamic structural analysis N87-12178
A note on nonlinear approaches to linear programming
[AD-A168666] N87-12253
FAILURE ANALYSIS
Delta launch vehicle accident investigation
[GPO-53-141] N87-11820
The role of damage-softened material behavior in the fracture of composites and adhesives
[NASA-CR-179640] N87-11846
Statistical strength comparison of metal matrix and polymeric matrix composites
[AD-A168847] N87-11850
Estimating jointly system and component reliabilities using a mutual censorship approach
[AD-A168544] N87-12013
Observation of the initiation and progression of damage in compressively loaded composite plates containing a cutout
[NASA-CR-179911] N87-12022
Detection of faults and software reliability analysis
[NASA-CR-179635] N87-12241
A second generation experiment in fault-tolerant software
[NASA-CR-179648] N87-12242
FAILURE MODES
Skin-stiffened composite panels loaded in the postbuckling range N87-11733
FAINT OBJECTS
Planet-Crossing Asteroid Search (PCAS) N87-12455
Jets, mass outflows and disks associated with young stellar objects N87-12486
FAR ULTRAVIOLET RADIATION
Large-scale structure and dynamics of solar active regions observed in the far ultraviolet N87-12527
FAST FOURIER TRANSFORMATIONS
Outline hardware design of a high speed FFT processor — Fast Fourier Transformation (FFT)
[BAE-ST-15891] N87-12171
Phase-only optical filter for use in an optical correlation system
[AD-D012396] N87-12343
FATIGUE (BIOLOGY)
Relationship of field tests to laboratory tests of muscular strength and endurance, and maximal aerobic power
[AD-A168260] N87-12150
FATIGUE (MATERIALS)
Fretting fatigue of carbon fiber reinforced plastic laminates
[DFVLR-FB-86-19] N87-11855
Surface chemistry and structural effects in the stress corrosion of glass and ceramic materials
[AD-A170243] N87-11896
FATIGUE LIFE
Impact and residual fatigue behavior of ARALL and AS6/5245 composite materials
[NASA-TM-89013] N87-11848
Fatigue properties of high strength titanium alloys at elevated temperatures (IMI 680)
[DFVLR-FB-86-19] N87-11865
FATIGUE TESTS
A check of crack propagation prediction models against test results generated under transport aircraft flight simulation loading
[NLR-TR-84005-U] N87-11782
FATS
Effect of long-term storage on some parameters of fat ingredient of freeze-dried products N87-12118
FAULT TOLERANCE
Detection of faults and software reliability analysis
[NASA-CR-179635] N87-12241
A second generation experiment in fault-tolerant software
[NASA-CR-179648] N87-12242
The implementation and use of Ada on distributed systems with high reliability requirements
[NASA-CR-179606] N87-12243
The implementation and use of Ada on distributed systems with high reliability requirements
[NASA-CR-179642] N87-12265
FAULT TREES
Comparison of maximus/bounding and Bayes/Monte Carlo for fault tree uncertainty analysis
[DE86-011704] N87-12310
FEASIBILITY ANALYSIS
Feasibility study in well-cooled magnetic bubble memory devices
[BR98249] N87-12168
Design study of a push-broom imager for the thermal infrared
[MATRA-094/PH/UB/137.85] N87-12348
FEDERAL BUDGETS
Making appropriations for the Department of Housing and Urban Development and for sundry independent agencies, boards, commissions, corporations and offices for the fiscal year ending September 30, 1987
[GPO-64-390] N87-12401
Hearings before the Subcommittee on Space Science and Applications of the Committee on Science and Technology, 99th Congress, 2nd Session, No. 132, 25, 27 February; 11, 13, 20 March; 9, 10 April, 1986, Volume 2
[GPO-61-777] N87-12402
FEEDBACK CONTROL
Hand off integrator apparatus for signal detection
[AD-D012391] N87-11926
FEEDERS
Automated tape laying machine for composite structures
[AD-D012366] N87-11851
FEEDFORWARD CONTROL
Aircraft automatic-flight-control system with inversion of the model in the feed-forward path using a Newton-Raphson technique for the inversion
[NASA-TM-88209] N87-11796
Control of wind power stations with variable velocity in a large range
[FOA-C-20613-E3] N87-12056
FETUSES
Behavioral reactions of animals exposed to spaceflight conditions in the prenatal period N87-12138
Effect of weightlessness on rat fetus skeletal development N87-12139
FEVER
Slowly-developing modifications in cutaneous circulatory control
[AD-A168702] N87-12152
FIBER COMPOSITES
Impact and residual fatigue behavior of ARALL and AS6/5245 composite materials
[NASA-TM-89013] N87-11848
Structural evaluation of high strain fiber and resin composite material systems
[AD-A170464] N87-11852
FIBER OPTICS
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A168450] N87-11885
Electro-optical control of solid fuel rocket burn rate
[AD-D012397] N87-11839
US long distance fiber optic networks: Technology, evolution and advanced concepts. Volume 3: Advanced networks and economics
[NASA-CR-179461] N87-11915
Power system applications of fiber optic sensors
[NASA-CR-179921] N87-12337
Research on materials and components for opto-electronic signal processing
[AD-A168751] N87-12365
FIBER REINFORCED COMPOSITES
Example of the use of Data Item No. 85001. Choice of reinforcement for a circular hole in a fibre reinforced laminated plate. (Data relating to one particular set of laminate properties)
[ESDU-86003] N87-11844
FIBERS
Simultaneous electrical resistivity and mass uptake measurements in bromine intercalated fibers
[NASA-TM-88900] N87-11841
Statistical strength comparison of metal matrix and polymeric matrix composites
[AD-A168847] N87-11850
Thermal conductivity of pristine and brominated P-100 fibers
[NASA-TM-88863] N87-11893
FIELD THEORY (PHYSICS)
Supersymmetry: Proceedings
[DE86-007853] N87-12334
Solution surfaces 7. Relativistic string in external field: General integral and particular solutions
[PREPRINT-467] N87-12379
FIGHTER AIRCRAFT
Vortex flap technology: A stability and control assessment
[NASA-CR-172439] N87-11795
FILE MAINTENANCE (COMPUTERS)
A file organization scheme for polygon data N87-12221
FILLETS
Shape design sensitivity analysis of built-up structures N87-11745
FILTRATION
Reclamation of water used for washing by means of reverse osmosis during long-term spaceflights N87-12120
FINANCE
Academic science/engineering: R and D funds, fiscal year 1984 (detailed statistical tables)
[PB86-216017] N87-12382
FINANCIAL MANAGEMENT
Academic science/engineering: R and D funds, fiscal year 1984 (detailed statistical tables)
[PB86-216017] N87-12382

Making appropriations for the Department of Housing and Urban Development and for sundry independent agencies, boards, commissions, corporations and offices for the fiscal year ending September 30, 1987
[GPO-64-330] N87-12401

FINITE DIFFERENCE THEORY
Application of viscous-inviscid interaction methods to transonic turbulent flows
[NASA-CR-179900] N87-11700
Structural sensitivity analysis: Methods, applications, and needs N87-11741
The prediction of transonic loading advancing helicopter rotors
[AD-A168217] N87-11781
Numerical routines for predicting ignition in pyrotechnic devices
[DE86-013251] N87-11909

FINITE ELEMENT METHOD
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A168450] N87-11685
Some observations on the behavior of the Langley model rotor blade
[NASA-CR-179880] N87-11695
PIAS: A program for an iterative aeroelastic solution N87-11725
Influence of analysis and design models on minimum weight design N87-11739
Shape design sensitivity analysis of built-up structures N87-11745
On optimal design for the blade-root/hub interface in jet engines N87-11769
Finite element analysis of composite plate impacted by a projectile N87-11843
Finite element modelling of composites, volume 1
[BR97502] N87-11845
The role of damage-softened material behavior in the fracture of composites and adhesives
[NASA-CR-179840] N87-11846
Finite element fracture analysis on microcomputer
[TI86-006214] N87-12028
A numerical study of diffraction in reentrant geologic structure
[AD-A168562] N87-12072

FIRE PREVENTION
Antimisting kerosene: Evaluation of low temperature performance
[DOT/FAA/CT-85/31] N87-11902

FIRES
Multidisciplinary approach to the design of high pressure oxygen systems N87-11780

FLAME PROPAGATION
Simulations of turbulent mixing and reacting flows and their applications to turbulence modeling
[NASA-CR-179829] N87-11960

FLAMMABILITY
Hydrogen: Air steam flammability limits and combustion characteristics at intermediate scale
[TI86-009881] N87-11871

FLAT PLATES
Maximum lift/drag ratio of flat plates with bluntness and skin friction at hypersonic speeds
[NASA-TM-88338] N87-11696

FLEXIBLE BODIES
Acta Aerodynamica Sinica (selected articles)
[AD-A168449] N87-11684
Computer aided analysis and optimization of mechanical system dynamics N87-11778

FLEXIBLE SPACECRAFT
Dual structural-control optimization of large space structures N87-11766

FLIGHT CHARACTERISTICS
A second generation experiment in fault-tolerant software
[NASA-CR-179848] N87-12242

FLIGHT CONTROL
Pilot and static errors in steady level flight
[ESDU-86006] N87-11691
National Transportation Safety Board safety recommendation N87-11706
A helicopter flight evaluation of kinesthetic-tactual displays
[AD-A168302] N87-12167

FLIGHT CREWS
Development of vision tests for air-to-air target detection
[AD-A168309] N87-12161

FLIGHT HAZARDS
Runway incursions at controlled airports in the United States
[PB86-917003] N87-11711

FLIGHT INSTRUMENTS
Psychophysiological aspects of color-coding of flight and navigation information on onboard electronic displays N87-12127

FLIGHT MANAGEMENT SYSTEMS
Rapid prototyping facility for flight research in artificial-intelligence-based flight systems concepts
[NASA-TM-88268] N87-12273

FLIGHT OPERATIONS
Research and technology
[NASA-TM-88852] N87-12530

FLIGHT SAFETY
Design of a takeoff performance monitoring system N87-11787
Strategy for safely returning space shuttle to flight status
[GPO-63-144] N87-11823
Investigation of the Challenger accident
[H-REPT-99-1016] N87-11824

FLIGHT SIMULATION
A check of crack propagation prediction models against test results generated under transport aircraft flight simulation loading
[NLR-TR-84005-U] N87-11782
Evaluation of a visual system in its support of simulated helicopter flight
[AD-A168629] N87-11783
Design of a takeoff performance monitoring system N87-11787
A helicopter flight evaluation of kinesthetic-tactual displays
[AD-A168302] N87-12167

FLIGHT SIMULATORS
Motion characteristics of the UTIAS flight research simulator motion-base
[UTIAS-TN-261] N87-11802
A network architecture for data-driven systems
[AD-A166764] N87-12267

FLIGHT STRESS (BIOLOGY)
An application of multidimensional scaling to describe stress among naval helicopter pilots
[AD-A168367] N87-12162

FLIGHT TEST INSTRUMENTS
A small, flexible and powerful data acquisition system for the F16 aircraft
[NLR-MP-85074-U] N87-11798

FLIGHT TESTS
Flight test report of the NASA icing research airplane: Performance, stability, and control after flight through natural icing conditions
[NASA-CR-179515] N87-11797
A helicopter flight evaluation of kinesthetic-tactual displays
[AD-A168302] N87-12167

FLIGHT TIME
General aviation activity and avionics survey
[AD-A168582] N87-11686

FLOATING POINT ARITHMETIC
Dynamic grid manipulation for PDEs (Partial Differential Equations) on hypercube parallel processors
[AD-A168679] N87-12266

FLOW CHARACTERISTICS
Investigation of the external flow analysis for density measurements at high altitude
[NASA-CR-172464] N87-11693
The prediction of transonic loading advancing helicopter rotors
[AD-A168217] N87-11781

FLOW DISTRIBUTION
Acta Aerodynamica Sinica (selected articles)
[AD-A168449] N87-11684
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A168450] N87-11685
Pilot-pressure measurements in flow fields behind a rectangular nozzle with exhaust jet for free-stream Mach numbers of 0.00, 0.60, and 1.20
[NASA-TM-88990] N87-11696
An experimental study of the aerodynamics of a NACA 0012 airfoil with a simulated glaze ice accretion
[NASA-CR-179897] N87-11701
Pressure and flow field measurements of axial turbine tip clearance flow in a linear cascade
[CUED/A-TURBO-TR-123] N87-11791
Velocity measurements for turbulent nonseparated flow over solid waves
[AD-A168662] N87-11971
Preliminary turbulence length scale measurements in a motored IC engine
[DE86-008171] N87-11999
An ecologic study of peat landforms in Canada and Alaska
[NASA-CR-179740] N87-12033

FLOW EQUATIONS
Analytic solutions of the nonlinear partial differential equations for transonic flow in physical spaces
[DFVLR-FB-86-14] N87-11705
Third-moment closure of turbulence for predictions of separating and reattaching shear flows: A study of Reynolds-stress closure model
[NASA-CR-177056] N87-11961

FLOW GEOMETRY
Boundary layer and parabolic flows
[ESA-TT-918] N87-11979

FLOW MEASUREMENT
User's manual for a TEACH computer program for the analysis of turbulent, swirling reacting flow in a research combustor
[NASA-CR-179547] N87-11868
Calibration of surface hot-film sensors in dilute polymer flows
[AD-A168601] N87-11972
Lift and drag measurements on a towing tank model of a tip vane turbine
[IW-R512] N87-11980

FLOW STABILITY
Nonlinear internal gravity wave propagation, saturation and absorption in the atmosphere
[AD-A170244] N87-12074

FLOW THEORY
Boundary layer and parabolic flows
[ESA-TT-918] N87-11979

FLUID FILTERS
Reclamation of water used for washing by means of reverse osmosis during long-term spaceflights N87-12120

FLUID FLOW
Free convection heat transfer in the critical region of binary fluid mixtures
[DE86-008856] N87-11978

FLUID MECHANICS
Statistical mechanics of charged objects: General method and applications to simple systems
[AD-A168918] N87-12329

FLUORESCENCE
Lifetimes and quenching of the B state of PO by atmospheric gases
[AD-A168735] N87-11880

FLUTTER
Optimization of cascade blade mistuning under flutter and forced response constraints N87-11732
Application of optimization techniques to the design of a flutter suppression control law for the DAST ARW-2 N87-11736

FLUTTER ANALYSIS
Concentrated mass effects on the flutter of a composite advanced turboprop model
[NASA-TM-88854] N87-12017

FLUX DENSITY
X-ray studies of BL lacertae objects N87-12506

FLYBY MISSIONS
NASA selects investigations for comet rendezvous mission
[NASA-TM-89261] N87-11808
TASS reports VEGAS-1 encounter with Halley's Comet N87-11812
Balloon probe and descent apparatus exploration of Venus discussed N87-11813

FLYWHEELS
Large wheel actuators definition study — spacecraft control
[TELDIX-15-020-880] N87-11834

FOCUSING
Development of vision tests for air-to-air target detection
[AD-A168309] N87-12161

FOKKER-PLANCK EQUATION
Stationary solutions of the Vlasov-Fokker-Planck equation — plasma equilibrium
[PREPRINT-104] N87-12294
Radial Fokker-Planck model for plasmas confined by magnetic mirror fields
[DE86-012225] N87-12353

FORCED CONVECTION
Effects of forced and free convections on structural temperatures of shuttle orbiter during reentry flight
[NASA-TM-88800] N87-11988

FOREBODIES
Normal force, pitching moment and side force of axisymmetric forebody-cylinder combinations for angles of attack up to 90 degrees and Mach numbers up to 1.2
[ESDU-86009] N87-11690

FORESTS
Interpreting forest and grassland biome productivity utilizing nested scales of image resolution and biogeographical analysis
[NASA-CR-179739] N87-12032

FORMAT
Design and experience with a generalized raster toolkit N87-12190
SMP: A solid modeling program version 2.0
[NASA-CR-178183] N87-12244

FORTRAN
The FORTRAN Formula Manipulator (FFM)
[REPT-293] N87-12264
FOURIER ANALYSIS
Velocity measurements for turbulent nonseparated flow over solid waves
[AD-A168682] N87-11971
FOURIER TRANSFORMATION
Development/Applications of FT-IR ATR (Fourier Transform IR Attenuated Total Internal Reflection) and photoacoustic dichroism techniques for structural characterization of polymer surfaces
[AD-A168519] N87-11894
VLSI (Very Large Scale Integrated circuits) implementation of a quantized sinusoid filter algorithm and its use to compute the discrete Fourier transform, part 2
[AD-A168605] N87-11942
Mathematical morphology applied to range image processing N87-12222
Reconstruction of two-dimensional signals from the Fourier transform magnitude
[AD-A168792] N87-12289
Planetary infrared astronomy using a cryogenic postdisperser on Fourier transform spectrometers N87-12422
Spectroscopic planetary detection N87-12481
FOVEA
Ocular hazards associated with laser exposure
[AD-A168506] N87-12151
FRACTURE MECHANICS
An in-situ study in SEM of delamination in several graphite/epoxy composite material systems
[NASA-CR-179839] N87-11847
Carburizing steel for high temperature service
[AD-A168327] N87-11877
A wedge test for quantifying fully plastic fracture
[AD-A168607] N87-12023
Finite element fracture analysis on microcomputer
[TM86-008214] N87-12028
FRACTURE STRENGTH
Improvement in ductility and fracture toughness of HIP'd and isothermally forged Ti-6Al-6V-2Sn powder with heat treatment
[AD-A168804] N87-11878
Correlation of fracture toughness and Charpy impact test results — steels
[TR1063] N87-12016
FRACTURES (MATERIALS)
Mechanical properties of various alloys in hydrogen
[NASA-CR-178874] N87-11889
FRACTURING
A wedge test for quantifying fully plastic fracture
[AD-A168607] N87-12023
FRAGMENTATION
Modeling of explosions: Fragmentation
[INPE-4022-NTE/264] N87-11969
FRAMES (DATA PROCESSING)
Keyframe-based subactors N87-12208
Incremental construction of 3-D models from a sequence of framed views: Matching partial objects N87-12223
Image techniques for the identification of depressions and other obstacles in automated guidance of roving robots N87-12224
Determining displacement fields along contours from image sequences N87-12231
FREE CONVECTION
Effects of forced and free convections on structural temperatures of shuttle orbiter during reentry flight
[NASA-TM-86600] N87-11968
Free convection heat transfer in the critical region of binary fluid mixtures
[DE86-006856] N87-11978
FREE ELECTRONS
A study of laser induced ionization of alkali metal vapours based on saturation of the first resonance transition
[UTIS-299] N87-11987
FREE FLOW
Pilot-pressure measurements in flow fields behind a rectangular nozzle with exhaust jet for free-stream Mach numbers of 0.00, 0.60, and 1.20
[NASA-TM-88990] N87-11896
Monte Carlo simulation of free jet flow from a slit, revision 1
[DE86-011877] N87-11975
FREEZE DRYING
Effect of long-term storage on some parameters of fat ingredient of freeze-dried products N87-12118
FREQUENCY ASSIGNMENT
Computer program for frequency assignments to aeronautical and maritime beacons and coast stations in the band 283.5 to 1600 kHz
[FOA-C-60018-E2] N87-11928
FREQUENCY DISTRIBUTION
World atlas of total sky-cover: Environmental research papers
[AD-A170474] N87-12090
FREQUENCY MODULATION
Spectral content of a transmitted FM signal
[BAE-BT-15690] N87-11930
FRESNEL LENSES
Fresnel lens study
[DE86-012249] N87-12345
FRETTING CORROSION
Fretting fatigue of carbon fiber reinforced plastic laminates
[DFVLR-FB-86-18] N87-11855
FUEL CELLS
Electrochemical investigation of lithium/potassium carbonate eutectic for application in modeling the molten carbonate fuel cell cathode
[DE86-001067] N87-11944
FUEL PUMPS
F100 fuel sampling analysis: Foreign samples
[AD-A168573] N87-11904
FUEL TANKS
Behavior of an Inconel 718 container in the presence of hydrogen — spacecraft fuel tanks
[ESA-CR(P)-2262] N87-11883
FUNCTIONS (MATHEMATICS)
Near-optimal starting solution for polynomial approximation of a continuous function in the L sub 1 norm
[PB86-215183] N87-12300
FUNGI
Sanitary and microbiological aspects of closed environment occupied by people and animals N87-12121
FUSION WELDING
Acceptance criteria for welds in ASTM A106 grade B steel pipe and plate
[NASA-TM-89052] N87-11874
FUZZY SETS
Use of fuzzy sets mathematics to assist pavement evaluation and management. Executive summary (revised March 18, 1986)
[PB86-214780] N87-12298

G

GALACTIC CLUSTERS
A photometric investigation of the rich supercluster fourteen fifty-one plus twenty-two N87-12507
Galaxy groups: Neutral hydrogen and dynamics N87-12512
The physical characteristics of the X-ray emitting gas in clusters of galaxies and constraints on dark matter N87-12514
GALACTIC EVOLUTION
The evolution of active galactic nuclei N87-12516
GALACTIC NUCLEI
Astronomical observations with an infrared array camera N87-12500
Non-thermal radiation mechanisms and processes in SS 433 and active galactic nuclei N87-12511
The evolution of active galactic nuclei N87-12516
GALACTIC RADIATION
Non-thermal radiation mechanisms and processes in SS 433 and active galactic nuclei N87-12511
GALACTIC STRUCTURE
The evolution of active galactic nuclei N87-12516
GALERKIN METHOD
Shape design sensitivity analysis of built-up structures N87-11745
GALLIUM ARSENIDES
High energy electron radiation degradation of gallium arsenide solar cells
[AD-A168402] N87-12050
Deep-level transient spectroscopy studies of gallium arsenide - aluminum gallium arsenide heterostructures and superlattices
[AD-A168328] N87-12361
Research on semiconductor heterostructures
[AD-A168357] N87-12363
LSI/VLSI ion implanted planar GaAs IC processing
[AD-A168786] N87-12366
High speed compound semiconductor devices in layered structures
[AD-A168866] N87-12368
Preparation and investigation of amorphous gallium arsenide films
[AD-A168907] N87-12369
GAME THEORY
Multiobjective optimization techniques for structural design N87-11760
GAMMA RAY ASTRONOMY
High energy neutrino emission from binary X-ray sources
[PREPRINT-471] N87-12529
GAMMA RAYS
Investigation of viability of quail embryos and chicks when eggs are exposed to gamma radiation and vibration as related to different terms of egg storage N87-12119
Gamma rays and neutrons from solar flares N87-12528
GANYMEDE
Table Mountain Observatory support to other programs N87-12454
GAPS
Geometric structure, pseudo band gaps, and surface vibrational resonances on metal surfaces
[AD-A168291] N87-11876
GAS CHROMATOGRAPHY
Organics in water contamination analyzer, phase 1
[NASA-CR-179901] N87-12060
Evaluation of method for collecting and concentrating organic trace impurities in air N87-12145
GAS COMPOSITION
Combustion gas spectroscopy using tunable lasers
[DE86-012873] N87-11888
GAS DYNAMICS
Magnetohydrodynamic shocks in molecular clouds N87-12354
GAS FLOW
Asympotic solutions to compressible laminar boundary-layer solutions for dusty-gas flow over a semi-infinite flat plate
[UTIAS-310] N87-11967
GAS PRESSURE
Mechanical properties of various alloys in hydrogen
[NASA-CR-178874] N87-11889
GAS SPECTROSCOPY
Combustion gas spectroscopy using tunable lasers
[DE86-012873] N87-11888
GAS TURBINE ENGINES
STAEBL: Structural tailoring of engine blades, phase 2 N87-11731
Control of gas turbines. The future: is a radical approach needed? — aircraft engines
[PNR-90295] N87-11798
Advanced Gas Turbine (AGT) Technology Project
[NASA-CR-179484] N87-11995
GAS TURBINES
Technology development for small high speed, mainshaft roller bearings
[AD-A168694] N87-11996
GATES (CIRCUITS)
Research on materials and components for opto-electronic signal processing
[AD-A168751] N87-12365
GAUGE THEORY
On the quantization of anomalous theories — gauge theory
[PREPRINT-473] N87-12321
GAUSS EQUATION
On the quantization of anomalous theories — gauge theory
[PREPRINT-473] N87-12321
GAUSS-MARKOV THEOREM
A central limit theorem for Markov paths and some properties of Gaussian random fields
[AD-A170258] N87-12307
GEARS
Performance limits of surface-hardened aluminum-alloy gears in vacuum
[ESA-ESTL-050] N87-11884
GELS
Fresnel lens study
[DE86-012249] N87-12345
GENERAL AVIATION AIRCRAFT
General aviation activity and avionics survey
[AD-A168582] N87-11686
Aircraft accident reports: Brief format, US civil and foreign aviation, issue number 5 of 1985 accidents
[PB86-916919] N87-11710
Aircraft accident reports: Brief format, US civil and foreign aviation, issue number 4 of 1985 accidents
[PB86-916918] N87-11712
Aircraft accident reports: Brief format, US civil and foreign aviation, issue number 3 of 1985 accidents
[PB86-916917] N87-11713
Review of accident data: US general aviation calendar year 1982
[PB86-201910] N87-11714
GENETICS
Fractals, computers and DNA N87-12214
GEOCHEMISTRY
Geochemistry and origin of regional dolomites
[DE86-012758] N87-12077
GEODESY
Army technology development. IBIS query. Software to support the Image Based Information System (IBIS) expansion for mapping, charting and geodesy
[AD-A169609] N87-12369

GEOGRAPHIC INFORMATION SYSTEMS
Interpreting forest and grassland biome productivity utilizing nested scales of image resolution and biogeographical analysis
[NASA-CR-179608] N87-12029
Interpreting forest and grassland biome productivity utilizing nested scales of image resolution and biogeographical analysis
[NASA-CR-179739] N87-12032
Integration of remotely sensed data and geographic information systems N87-12216
A context based technique for smoothing of digital thematic maps N87-12219
Army technology development. IBIS query. Software to support the Image Based Information System (IBIS) expansion for mapping, charting and geodesy
[AD-A169609] N87-12389
GEOGRAPHY
A user's guide to the socioeconomic environmental demographic information system (SEEDIS)
[AD-A169917] N87-12388
GEOMAGNETIC LATITUDE
An equatorial scintillation model
[AD-A168723] N87-11924
GEOMAGNETIC TAIL
Plasma waves associated with the first AMPTE magnetotail barium release
[AD-A170277] N87-12075
GEOMETRIC RECTIFICATION (IMAGERY)
LANDSAT-D program. Volume 2: Ground segment
[NASA-CR-177174] N87-12030
GEOMETRICAL OPTICS
Electromagnetic backscattering by corner reflectors
[NASA-CR-179609] N87-11914
GEOMETRICAL THEORY OF DIFFRACTION
Electromagnetic backscattering by corner reflectors
[NASA-CR-179848] N87-11913
GEOMETRY
Vertical deflection characteristics of aircraft tyres
[ESDU-86006] N87-11992
Research in expert interactive cartographic systems
[AD-A168337] N87-12041
Experiences with using Prolog for geometry N87-12179
PORTRAY: An image synthesis system N87-12181
Profiling graphic display systems N87-12183
Exploiting classes in modeling and display software N87-12192
Animating human figures: Perspectives and directions N87-12194
Recognition of two-dimensional shapes
[AD-A168403] N87-12250
DFR (Decreasing Failure Rate) property of first passage times and its preservation under geometric compounding
[AD-A169871] N87-12304
GEOSYNCHRONOUS ORBITS
Geostationary orbital estimation using a Kalman filter
[UTIAS-242] N87-11816
GERMANIUM
Interfacial properties of germanium nitride dielectric layers in germanium
[AD-A168332] N87-12362
GIACOBINI-ZINNER COMET
Imaging studies of comets N87-12443
Composition of faint comets N87-12445
Infrared imaging and photometry of Comet Giacobini-Zinner N87-12447
Planetary spectroscopy N87-12450
Infrared photometry of periodic comets N87-12453
Cometary spectroscopy N87-12458
Astrometric observations of comets and asteroids and subsequent orbital investigations N87-12461
The International Halley Watch N87-12490
International Halley Watch: Discipline specialists for photometry and polarimetry N87-12491
International Halley Watch: Discipline specialists for radio science N87-12493
GIANT STARS
Chromospheric activity of cool giant stars
[NASA-CR-177184] N87-12510
GIBBS PHENOMENON
Convergence theorems of sampler processes with applications to image processing
[AD-A170256] N87-12306
GLASS
The effect of high pressure on electrical relaxation in PPO and electrical conductivity in PPO complexed with lithium salts
[AD-A169694] N87-11882
GLASS COATINGS
Fresnel lens study
[DE86-012249] N87-12245
GLASS FIBERS
Detecting glass fibers using computer vision N87-12257
GLOBAL AIR POLLUTION
Development of data processing, interpretation and analysis system for remote sensing of trace atmospheric gas species
[NASA-CR-179862] N87-12059
GLOBAL POSITIONING SYSTEM
Fast optimal orbit estimation from GPS measurements
[INPE-4016-NTE/263] N87-11817
GOALS
National aeronautical R and D goals: Technology for America's future
[PB86-209772] N87-12405
GOVERNMENT PROCUREMENT
System safety procedures for nondevelopment item (NDI) acquisitions
[AD-A169363] N87-12012
The Brazilian satellite remote sensing
[INPE-4006-PRE/999] N87-12040
GOVERNMENT/INDUSTRY RELATIONS
National Forum on the Future of Automated Materials Processing in US Industry: The Role of Sensors. Report of a workshop (1st) held at Santa Barbara, California on December 16-17, 1985
[PB86-212040] N87-11912
The Brazilian satellite remote sensing
[INPE-4006-PRE/999] N87-12040
Biennial science and technology report to the Congress, 1983-1984
[PB86-209632] N87-12403
GOVERNMENTS
Federal government information technology: Management, security and congressional oversight
[PB86-205499] N87-12397
GRAIN BOUNDARIES
Grain boundary oxidation and fatigue crack growth at elevated temperatures
[NASA-CR-179529] N87-11873
GRAMMARS
Attribute grammars in the applicative programming language TWENTEL
[INF-86-16] N87-12290
Tree grammars as a pattern matching mechanism for code generation
[TUM-I8524] N87-12279
GRAPH THEORY
Matching extension in bipartite graphs. 1. Introduction and terminology
[AD-A168666] N87-12285
GRAPHITE
Simultaneous electrical resistivity and mass uptake measurements in bromine intercalated fibers
[NASA-TM-86900] N87-11841
Statistical strength comparison of metal matrix and polymeric matrix composites
[AD-A169847] N87-11850
Thermal conductivity of pristine and brominated P-100 fibers
[NASA-TM-86863] N87-11893
Simulation studies for surfaces and materials strength
[NASA-CR-177046] N87-12357
GRAPHITE-EPOXY COMPOSITES
An in-situ study in SEM of delamination in several graphite/epoxy composite material systems
[NASA-CR-179639] N87-11847
Automated tape laying machine for composite structures
[AD-D012386] N87-11851
Expandable epoxy application
[AD-A168669] N87-11895
GRAPHS (CHARTS)
Matching extension in bipartite graphs. 1. Introduction and terminology
[AD-A168666] N87-12285
GRASSLANDS
Interpreting forest and grassland biome productivity utilizing nested scales of image resolution and biogeographical analysis
[NASA-CR-179739] N87-12032
GRATINGS
Dynamic bar pattern method
[AD-D012383] N87-12342
GRAVITATION
Mathematical and statistical analysis
[AD-A169277] N87-11830
GRAVITATIONAL EFFECTS
Interview on medical program of 237-day flight N87-11814
Geostationary orbital estimation using a Kalman filter
[UTIAS-242] N87-11816
Tolerance to +Gz accelerations of individuals of different ages other than pilots N87-12130
Effect of weightlessness on rat fetus skeletal development N87-12139
Problems of aviation and space medicine, biology and psychology discussed at fifteenth Gagarin Scientific Lectures N87-12148
GRAVITY WAVES
Nonlinear internal gravity wave propagation, saturation and absorption in the atmosphere
[AD-A170244] N87-12074
GREEN'S FUNCTIONS
Structural sensitivity analysis: Methods, applications, and needs N87-11741
GROUND STATE
Density of states due to pairing of impurities in semiconductor systems
[INPE-4009-PRE/1001] N87-12358
GROUND STATIONS
Fast optimal orbit estimation from GPS measurements
[INPE-4016-NTE/263] N87-11817
GROUND SUPPORT EQUIPMENT
Ground aircraft deicing technology review
[DOT/FAA/CT-85/21] N87-11707
GROUND TESTS
SP-100 ground engineering system test at Hanford Potential Bidders' Site Tour, December 18, 1985
[DE86-000964] N87-12305
GROUND WATER
An ecologic study of peat landforms in Canada and Alaska
[NASA-CR-179740] N87-12030
GROUP THEORY
Relation between tau-functions as determinants and group orbits: Plucker relations
[MEMO-568] N87-12316
N-dimensional totally disconnected topological groups
[REPT-296] N87-12318
GUIDANCE SENSORS
National Forum on the Future of Automated Materials Processing in US industry: The Role of Sensors. Report of a workshop (1st) held at Santa Barbara, California on December 16-17, 1985
[PB86-212040] N87-11912
GUN PROPELLANTS
High performance liquid chromatography of propellants. Part 1: Analysis of M1, M6, and M10 propellants
[AD-A168206] N87-11900
GYROSCOPES
State-space analysis of the Trident 2 mark 6 gyro
[AD-A168404] N87-11821

H

HADRONS
Multichannel nonpotential scattering theory
[PREPRINT-476] N87-12330
A hardware processor for a missing energy trigger
[PREPRINT-468] N87-12336
Stochastic mechanics of a Dirac particle in two space-time dimensions
[PREPRINT-474] N87-12381
HALLEY'S COMET
TASS reports VEGAS-1 encounter with Halley's Comet N87-11812
Imaging studies of comets N87-12443
Atlas of Comet Halley 1910 II N87-12444
Planetary astronomy N87-12448
Planetary spectroscopy N87-12450
Infrared photometry of periodic comets N87-12453
Table Mountain Observatory support to other programs N87-12454
Radiative transfer in planetary atmospheres N87-12456
Optical investigation of Comet Halley N87-12457
Cometary spectroscopy N87-12458
Astrometric observations of comets and asteroids and subsequent orbital investigations N87-12461
Occultation studies of the solar system N87-12463
Photometry of Comet Halley N87-12464
Study of comets at wavelengths between 0.5 and 19 microns N87-12466
Ground-based observation of Comet Halley N87-12468
Spectroscopy of comets N87-12479
The International Halley Watch N87-12490
International Halley Watch: Discipline specialists for photometry and polarimetry N87-12491
International Halley Watch: Discipline specialists for large scale phenomena N87-12492
International Halley Watch: Discipline specialists for radio science N87-12493
International Halley Watch: Discipline specialists for infrared spectroscopy and radiometry N87-12494
International Halley Watch: Discipline specialists for near-nucleus studies N87-12495
International Halley Watch: Discipline specialists for spectroscopy and spectrophotometry N87-12496
International Halley Watch: Discipline specialists for astronomy N87-12497

HALOGEN OCCULTATION EXPERIMENT
HALOE science investigation
[NASA-CR-179825] N87-11857
HARDENING (MATERIALS)
Performance limits of surface-hardened aluminum-alloy gears in vacuum
[ESA-ESTL-059] N87-11864
HARDNESS
Carburizing steel for high temperature service
[AD-A168327] N87-11877
HARDWARE
Outline hardware design of a high speed FFT processor — Fast Fourier Transformation (FFT)
[BAE-BT-15891] N87-12171
Hardware assistance for Z-buffer visible surface algorithms N87-12205
A hardware processor for a missing energy trigger
[PREPRINT-468] N87-12336
HAZARDS
Ocular hazards associated with laser exposure
[AD-A168506] N87-12151
Image techniques for the identification of depressions and other obstacles in automated guidance of roving robots N87-12224
HEALTH
Carbon dioxide increase and human health: Data and research requirements for determining consequences (including a bibliography for additional reading)
[DE86-012760] N87-12156
HEART FUNCTION
Human heart function in early hours and days of head-down tilt (echocardiographic data) N87-12112
HEART RATE
Orthostatic cardiac rhythm response in waking Macaca mulatta monkeys N87-12147
Relationship of field tests to laboratory tests of muscular strength and endurance, and maximal aerobic power
[AD-A168260] N87-12150
HEAT ACCLIMATIZATION
Slowly-developing modifications in cutaneous circulatory control
[AD-A168702] N87-12152
HEAT EXCHANGERS
Design of heat exchange element for plastic film heat exchanger
[DE86-011042] N87-11973
Advanced heat-pipe heat exchanger and microprocessor-based modulating burner controls development
[PB86-203239] N87-11981
HEAT MEASUREMENT
Heat capacity and enthalpy of liquids: Alkanes
[ESDU-86007] N87-12377
HEAT OF FORMATION
Norepinephrine used to control energy of heat production and utilization of ATP in single muscular contraction under normal and hyperoxic conditions N87-12141
HEAT PUMPS
Design of heat exchange element for plastic film heat exchanger
[DE86-011042] N87-11973
New high temperature absorbent for absorption heat pumps
[DE86-012483] N87-11976
Free-piston Stirling engine development
[PB86-213980] N87-12010
HEAT STORAGE
Equatorial Pacific Ocean Climate Studies (EPOCS): Progress and plans
[PB86-213493] N87-12092
HEAT TOLERANCE
Human tolerance to high-intensity contact heat on integumental surface N87-12137
HEAT TRANSFER
Effectiveness: N sub TU relationships for the design and performance evaluation of two-stream heat exchangers
[ESDU-86016] N87-11959
Asymptotic solutions to compressible laminar boundary-layer solutions for dusty-gas flow over a semi-infinite flat plate
[UTIAS-310] N87-11967
Design of heat exchange element for plastic film heat exchanger
[DE86-011042] N87-11973
The direct and indirect effects of latent heat release on extratropical cyclone development N87-12097
Human exercise and heat exchange in thermal environments
[AD-A168746] N87-12154
HEAT TREATMENT
Improvement in ductility and fracture toughness of HIP'd and isothermally forged Ti-6Al-6V-2Sn powder with heat treatment
[AD-A168604] N87-11878
Effect of laser hardening on microstructure and wear resistance in medium carbon/chromium steels
[DE86-012021] N87-11880
HEIGHT
HF (High Frequency) absolute time of arrival sensing
[AD-A168275] N87-11917
HELICOPTER CONTROL
A brief introduction to the helicopter
[NLR-MP-85062-U] N87-11868
HELICOPTER DESIGN
A brief introduction to the helicopter
[NLR-MP-85062-U] N87-11868
Overview: Applications of numerical optimization methods to helicopter design problems N87-11751
Helicopter rotor blade aerodynamic optimization by mathematical programming N87-11753
A rotor optimization using regression analysis N87-11755
Application of numerical optimization to rotor aerodynamic design N87-11757
Aeroelastic-aerodynamic optimization of high speed helicopter-compound rotor N87-11758
HELICOPTER ENGINES
Compound cycle engine program
[NASA-TM-88879] N87-11790
HELICOPTER PERFORMANCE
The 3600 hp split-torque helicopter transmission
[NASA-CR-174932] N87-11788
HELICOPTERS
A brief introduction to the helicopter
[NLR-MP-85062-U] N87-11868
Recent Experiences in Multidisciplinary Analysis and Optimization, part 2
[NASA-CP-2327-PT-2] N87-11750
Application of modern structural optimization to vibration reduction in rotorcraft N87-11752
The 3600 hp split-torque helicopter transmission
[NASA-CR-174932] N87-11788
Compound cycle engine program
[NASA-TM-88879] N87-11790
FAA helicopter/heliport research, engineering, and development bibliography, 1964-1986
[FAA/PM-86/47] N87-11798
The 8 m x 6 m low speed wind tunnel at the Chinese Aerodynamic Research and Development Center
[AD-A168448] N87-11803
An application of multidimensional scaling to describe stress among naval helicopter pilots
[AD-A168367] N87-12162
A helicopter flight evaluation of kinesthetic-tactual displays
[AD-A168302] N87-12167
Introduction to helicopter noise
[ISL-NB-401/84] N87-12327
HELIPORTS
FAA helicopter/heliport research, engineering, and development bibliography, 1964-1986
[FAA/PM-86/47] N87-11798
HEMATOPOIETIC SYSTEM
Effect of coamide and folicobalamin on erythropoiesis under normal living conditions and during antiorthostatic hypokinesia N87-12136
HEMODYNAMIC RESPONSES
Venous pressure in jugular vein system and effectiveness of blood return to right heart during 120-day head-down tilt N87-12111
Human heart function in early hours and days of head-down tilt (echocardiographic data) N87-12112
Typological characteristics of central hemodynamics of monkeys in clinostatic and orthostatic positions N87-12116
USSR report: Space Biology and Aerospace Medicine, vol. 20, no. 4, July - August 1986
[JPRS-USB-86-006] N87-12124
Capabilities of ultrasonic methods of evaluating hemodynamics of cardiocerebrovascular system N87-12126
Central hemodynamic parameters during dry immersion of patients with borderline hypertension N87-12142
Relationship between constitutional distinctions and functional characteristics of the cardiovascular system of healthy subjects and patients with hypertension in clinostatic and orthostatic position N87-12143
HETEROJUNCTIONS
Deep-level transient spectroscopy studies of gallium arsenide - aluminum gallium arsenide heterostructures and superlattices
[AD-A168328] N87-12361
Research on semiconductor heterostructures
[AD-A168357] N87-12363
HEURISTIC METHODS
Influence of analysis and design models on minimum weight design N87-11739
Correspondence in apparent motion: Defining the heuristics N87-12229
HIERARCHIES
Relation between tau-functions as determinants and group orbits: Plucker relations
[MEMO-668] N87-12318
HIGH ALTITUDE ENVIRONMENTS
Distinctions of capillarization of white rat skeletal muscle during adaptation to high altitude of the Pamirs and Antarctica N87-12117
HIGH CURRENT
Statistical distributions of breakdown voltages in a high current spark gap
[DE86-012281] N87-11950
HIGH ENERGY INTERACTIONS
A hardware processor for a missing energy trigger
[PREPRINT-468] N87-12336
HIGH FREQUENCIES
HF (High Frequency) absolute time of arrival sensing
[AD-A168275] N87-11917
HIGH LEVEL LANGUAGES
PORTRAY: An image synthesis system N87-12181
PS: A nonprocedural language with data types and modules
[NASA-CR-178196] N87-12246
LUSTRE: A data flow language for real time
[ETN-86-98400] N87-12262
HIGH PRESSURE
The effect of high pressure on electrical relaxation in PPO and electrical conductivity in PPO complexed with lithium salts
[AD-A168694] N87-11862
HIGH RESOLUTION
Electron tunneling microscopy
[AD-A168234] N87-12359
High annular resolution stellar interferometry
[AD-A168755] N87-12496
HIGH REYNOLDS NUMBER
Vortex shedding of a square cylinder in front of a slender airfoil at high Reynolds numbers. Part 2: Compressibility effect
[MPIS-24/1985] N87-11704
HIGH SPEED
Technology development for small high speed, mainshaft roller bearings
[AD-A168694] N87-11996
HIGH STRENGTH ALLOYS
Improvement in ductility and fracture toughness of HIP'd and isothermally forged Ti-6Al-6V-2Sn powder with heat treatment
[AD-A168604] N87-11878
Fatigue properties of high strength titanium alloys at elevated temperatures (IMI 685)
[DFVLR-FB-86-19] N87-11885
HIGH TEMPERATURE
New high temperature absorbent for absorption heat pumps
[DE86-012483] N87-11976
HIGH TEMPERATURE GASES
Analysis of compressible boundary layer with real gas effects N87-11889
HIGH TEMPERATURE TESTS
Fatigue properties of high strength titanium alloys at elevated temperatures (IMI 685)
[DFVLR-FB-86-19] N87-11885
HIGHLY MANEUVERABLE AIRCRAFT
Forward-swept wing configuration designed for high maneuverability by use of a transonic computational method
[NASA-TP-2628] N87-11702
HILBERT SPACE
Stochastic integration for operator valued processes on Hilbert spaces and on nuclear spaces
[AD-A168501] N87-12315
HISTOLOGY
Image analysis, perception strategy and cognitive strategy — microscopy images of biological cells
[ETN-86-98401] N87-12104
HISTORIES
Space activities of western Europe
[AD-A168424] N87-11807
The 1915 epistolary controversy between A. Einstein and T. Levi-Civita
[PREPRINT-472] N87-12380
HOLE DISTRIBUTION (MECHANICS)
Example of the use of Data Item No. 85001. Choice of reinforcement for a circular hole in a fibre reinforced laminated plate. (Data relating to one particular set of laminate properties)
[ESDU-86003] N87-11844
HOLOGRAPHY
Phase-only optical filter for use in an optical correlation system
[AD-D012396] N87-12343
HOMEOSTASIS
Philosophical aspects of adaptation theory N87-12108

Mathematical models of fluid-electrolyte metabolism
N87-12106

HOOP COLUMN ANTENNAS
Thermal analysis of radiometer containers for the 122m hoop column antenna concept
[NASA-TM-88026] N87-11966

HOT ISOSTATIC PRESSING
Fabrication of cooled radial turbine rotor
[NASA-CR-179609] N87-11789
Dispersion and blending of SiC (silicon carbide) whiskers in RSP aluminum powders
[AD-A169836] N87-11849
Improvement in ductility and fracture toughness of HIP'd and isothermally forged Ti-6Al-6V-2Sn powder with heat treatment
[AD-A169804] N87-11878

HOT SURFACES
Infrared observations of outer planet satellites
N87-12423

HUBS
On optimal design for the blade-root/hub interface in jet engines N87-11769

HUMAN BEINGS
Animating human figures: Perspectives and directions
N87-12194
Psychological concepts in a parallel system
[AD-A169615] N87-12390

HUMAN BODY
The interactive specification of human animation
N87-12195
Goal directed animation using English motion commands N87-12196
VIRYA: A motion control editor for kinematic and dynamic animation N87-12197
Near-real-time control of human figure models
N87-12198
Modeling and animating three-dimensinal articulate figures N87-12199
Keyframe-based subactors N87-12208

HUMAN FACTORS ENGINEERING
The space station: Human factors and productivity
[NASA-CR-179905] N87-12166
Computer aided design using anthropometry: A strategy
[BAE-HC/CAD/84-1] N87-12257

HUMAN PERFORMANCE
Professional work capacity and functional state of operator exposed to repeated optokinetic and antiorthostatic factors N87-12110
Performance regulation and error control in a test of perceptual speed
[DFVLR-FB-86-13] N87-12164
The value of global self ratings in differential diagnostics
[DFVLR-FB-86-20] N87-12165
The space station: Human factors and productivity
[NASA-CR-179905] N87-12166

HUMAN REACTIONS
Mathematical model of human kinematic reactions to impacts N87-12133
Technology transfer primer
[PB86-205941] N87-12404

HUMAN TOLERANCES
Mathematical model of human kinematic reactions to impacts N87-12133
Use of central electroanalgesia for functional recovery from motion sickness N87-12134
Human tolerance to high-intensity contact heat on integumental surface N87-12137

HUMIDITY
On the role of moist baroclinic instability in th e development of polar lows and comma clouds
[INPE-3971-PRE/984] N87-12087

HYDRATION
Infrared observations of planets N87-12459

HYDRAULIC JETS
Evaluation of waterjet-machined metal matrix composite tensile specimens
[DE86-012254] N87-11854

HYDROCYANIC ACID
Combustion gas spectroscopy using tunable lasers
[DE86-012873] N87-11868

HYDRODYNAMIC EQUATIONS
Numerical hydrodynamic models of planetary nebulae
N87-12517

HYDROGEN
Hydrogen: Air steam flammability limits and combustion characteristics at intermediate scale
[TI86-009861] N87-11871
Behavior of an Inconel 718 container in the presence of hydrogen — spacecraft fuel tanks
[ESA-CR(P)-2262] N87-11880
Galaxy groups: Neutral hydrogen and dynamics
N87-12512

HYDROGEN PRODUCTION
Calculation of potential energy surfaces for HCO and HNO using many-body methods
[AD-A169611] N87-11883

HYDROXYCORTICOSTEROID
Effect of hydrocortisone on osteogenic function of mouse bone marrow N87-12122

HYPERBOLIC DIFFERENTIAL EQUATIONS
Transformation of two and three-dimensional regions by elliptic systems
[NASA-CR-179651] N87-12281

HYPEROXIA
Norepinephrine used to control energy of heat production and utilization of ATP in single muscular contraction under normal and hyperoxic conditions
N87-12141

HYPERSONIC FLOW
Analysis of compressible boundary layer with real gas effects N87-11889

HYPERSONIC SPEED
Maximum lift/drag ratio of flat plates with bluntness and skin friction at hypersonic speeds
[NASA-TM-88338] N87-11898

HYPERTENSION
Central hemodynamic parameters during dry immersion of patients with borderline hypertension N87-12142
Relationship between constitutional distinctions and functional characteristics of the cardiovascular system of healthy subjects and patients with hypertension in clinostatic and orthostatic position N87-12143

HYPOBARIC ATMOSPHERES
On the role of moist baroclinic instability in th e development of polar lows and comma clouds
[INPE-3971-PRE/984] N87-12087

HYPOKIMESIA
Mathematical models of fluid-electrolyte metabolism
N87-12106
Venous pressure in jugular vein system and effectiveness of blood return to right heart during 120-day head-down tilt N87-12111
Human heart function in early hours and days of head-down tilt (echocardiographic data) N87-12112
Human blood free amino acids at early stage of head-down tilt N87-12113
Blood serum enzyme activity in healthy man with simulation of effects of weightlessness N87-12114
Paramecium test for toxic substances in human blood during simulated weightlessness N87-12115
Typological characteristics of central hemodynamics of monkeys in clinostatic and orthostatic positions
N87-12116
Effect of coamide and folicobalamin on erythropoiesis under normal living conditions and during antiorthostatic hypokinesia N87-12136
Functional state of somatotropic cells of adenohypophysis in hypokinetic rats N87-12140

HYPOTHERMIA
Human exercise and heat exchange in thermal environments
[AD-A168746] N87-12154

HYSTERESIS
Motion characteristics of the UTIAS flight research simulator motion-base
[UTIAS-TN-261] N87-11802

I

ICE
An experimental study of the aerodynamics of a NACA 0012 airfoil with a simulated glaze ice accretion
[NASA-CR-179697] N87-11701
Search for volatiles in the surface of icy satellites
N87-12414

ICE FORMATION
Flight test report of the NASA icing research airplane: Performance, stability, and control after flight through natural icing conditions
[NASA-CR-179515] N87-11797

ICE PREVENTION
Ground aircraft deicing technology review
[DOT/FAA/CT-85/21] N87-11707

IDENTIFYING
Detection, identification, and settling of bacteria from an aerosol; testing of a detector for aerosols with bacteria and preliminary investigation of settling on different surface materials
[FOA-C-40229-B2] N87-12103

IGNITION
Hot-spot model for calculating the threshold for shock initiation of pyrotechnic mixtures
[DE86-011638] N87-11866
Numerical routines for predicting ignition in pyrotechnic devices
[DE86-013251] N87-11909

IGNITION LIMITS
Hydrogen: Air steam flammability limits and combustion characteristics at intermediate scale
[TI86-009861] N87-11871

ILLINOIS
Geochemistry and origin of regional dolomites
[DE86-012786] N87-12077

IMAGE ANALYSIS
Correspondence in apparent motion: Defining the heuristics N87-12229
Determining displacement fields along contours from image sequences N87-12231

IMAGE ENHANCEMENT
LANDSAT-D program. Volume 2: Ground segment
[NASA-CR-177174] N87-12090

IMAGE PROCESSING
Radon optical processing in radon space
[AD-A169612] N87-11943
Two-dimensional polygonal representation of maps for use with autonomous vehicle route planning
[AD-A170301] N87-12044
Nature and origin of mineral coatings on volcanic rocks of the Black Mountain, Stonewall Mountain and Kane Springs Wash volcanic centers, southern Nevada
[NASA-CR-179738] N87-12067
Image analysis, perception strategy and cognitive strategy — microscopy images of biological cells
[ETN-86-96401] N87-12104
An encoding scheme for presentation graphics with animation N87-12177
PORTRAY: An image synthesis system N87-12181
Interfacing image processing and computer graphics systems using an artificial visual system N87-12210
Connected component labeling using modified linear quadtrees N87-12211
A knowledge-based approach to computer vision systems N87-12215
Image segmentation based on color and texture gradient N87-12217
Map/image congruency evaluation knowledge based system N87-12218
Principle of visual color coding applied to satellite imagery N87-12220
Mathematical morphology applied to range image processing N87-12222
A computational theory of 3D shape reconstruction from image contours N87-12225
Selection and use of image features for segmentation of boundary images N87-12226
Speeded phase discrimination: Evidence for global to local processing N87-12228
Three processing characteristics of texture discrimination N87-12230
Sequential estimation of boundaries in texture images
N87-12234
Detection of specularities in colour images using local operators N87-12235
Detecting glass fibers using computer vision
N87-12237
Contour line region segmentation N87-12240
A study of relaxation labelling methods and their role in computer vision
[BAE-BT-14865] N87-12258
The extraction of knowledge from data: An evaluation of Intelligent Knowledge Based Systems (IKBS) — Image processing
[BAE-BT-15035] N87-12276
A complex extension of the Hadamard transform for correlation purposes — scene correlation with matched filters
[BAE-BT-14469] N87-12292
Convergence theorems of sampler processes with applications to image processing
[AD-A170256] N87-12306
Optics '86: Four Western European Countries Review Recent Achievements
[AD-A170262] N87-12344
Army technology development. IBIS query. Software to support the Image Based Information System (IBIS) expansion for mapping, charting and geodesy
[AD-A169609] N87-12369

IMAGE RECONSTRUCTION
High resolution imaging N87-12418

IMAGE RESOLUTION
Interpreting forest and grassland biome productivity utilizing nested scales of image resolution and biogeographical analysis
[NASA-CR-179739] N87-12032

IMAGES
Research in expert interactive cartographic systems
[AD-A168337] N87-12041

IMAGING TECHNIQUES
Ultrasonic imaging and automated flaw detection system
[AD-A168195] N87-12011

LANDSAT-D program. Volume 2: Ground segment [NASA-CR-177174] N87-12030
An adaptive subdivision by sliding boundary surfaces for fast ray tracing N87-12182
Using caching and breadth-first search to speed up ray-tracing N87-12184
A cel-based model for paint systems N87-12189
Design and experience with a generalized raster toolkit N87-12190
Methods for stochastic spectral synthesis N87-12202
Survey of texture mapping N87-12207
Connected component labeling using modified linear quadtrees N87-12211
Graphical applications of L-systems N87-12213

IMMOBILIZATION
Blood serum enzyme activity in healthy man with simulation of effects of weightlessness N87-12114
Paramedum test for toxic substances in human blood during simulated weightlessness N87-12115

IMMUNITY
Stress and neuroendocrine regulation of immune responses [AD-A168766] N87-12155

IMMUNOLOGY
Stress and neuroendocrine regulation of immune responses [AD-A168766] N87-12155

IMP
Conceptual design of a synoptic interplanetary monitor platform at L sub 1 (SIMPL) [AD-A168522] N87-11828

IMPACT DAMAGE
Crash dynamics program transport seat performance and cost benefit study [DOT/FAA/CT-85/36] N87-11706
Finite element analysis of composite plate impacted by a projectile N87-11843
Mathematical model of human kinematic reactions to impacts N87-12133

IMPACT STRENGTH
Impact and residual fatigue behavior of ARALL and AS5/5245 composite materials [NASA-TM-89013] N87-11848

IMPACT TESTS
Crash dynamics program transport seat performance and cost benefit study [DOT/FAA/CT-85/36] N87-11706

IMPURITIES
Density of states due to pairing of impurities in semiconductor systems [INPE-4009-PRE/1001] N87-12358

INCOMPRESSIBLE FLOW
Contribution to the analysis of high-lift airfoil aerodynamics [AD-A168401] N87-11703
Numerical solution of the incompressible Navier-Stokes equations in three-dimensional generalized curvilinear coordinates [NASA-TM-86840] N87-11964
Quantized vortex filaments in incompressible fluids [DE86-011249] N87-11974

INCOMPRESSIBLE FLUIDS
Quantized vortex filaments in incompressible fluids [DE86-011249] N87-11974

INCONEL (TRADEMARK)
Behavior of an Inconel 718 container in the presence of hydrogen — spacecraft fuel tanks [ESA-CR(P)-2262] N87-11883

INDEPENDENT VARIABLES
Methods for calculating the probability distribution of sums of independent random variables [AD-A170465] N87-12309

INDEXES (DOCUMENTATION)
Publications of the Jet Propulsion Laboratory, 1984 [NASA-CR-179870] N87-12386

INDICATING INSTRUMENTS
Theoretical and experimental investigations of sensor location for optimal aeroelastic system state estimation N87-11794

INDIUM ARSENIDES
Zone leveling and solution growth of complex compound semiconductors in space [NASA-CR-179864] N87-12356

INDIUM COMPOUNDS
Optimization of p-CuInSe sub 2/n-CdZnS solar cells [DE86-010700] N87-12052
Synthesis and crystal and molecular structure of In(C5Me5)-An apparent octahedral cluster [AD-A168281] N87-12360

INDIUM PHOSPHATES
Zone leveling and solution growth of complex compound semiconductors in space [NASA-CR-179864] N87-12356

INDUSTRIAL SAFETY
Safety aspects of large-scale combustion of hydrogen [DE86-007375] N87-11864

INERTIAL REFERENCE SYSTEMS
New experiments to constrain the coefficients of the Robertson transformations for inertial systems [NASA-CR-179909] N87-12320

INFILTRATION
Modeling of infiltration kinetics and interfacial bond strength in aluminum matrix-silicon carbide composites [AD-A170480] N87-11853

INFORMATION
Public perspectives on government information technology: A review of survey research on privacy, civil liberties and the democratic process [PB86-218419] N87-12399

INFORMATION DISSEMINATION
Optimization in the systems engineering process N87-11719
Federal government information technology: Management, security and congressional oversight [PB86-205499] N87-12397
NTIS (National Technical Information Service) privatization study responses to April 28, 1986 Federal register notice request for public comment [PB86-211240] N87-12398
Public perspectives on government information technology: A review of survey research on privacy, civil liberties and the democratic process [PB86-218419] N87-12399
Technology transfer primer [PB86-205341] N87-12404

INFORMATION FLOW
Technology transfer primer [PB86-205341] N87-12404

INFORMATION MANAGEMENT
Technology transfer primer [PB86-205341] N87-12404

INFORMATION RETRIEVAL
Extending a relational interface with recursion — expert systems; data base systems [INF-86-10] N87-12396

INFORMATION SYSTEMS
Laser based information systems (selected pages) [AD-A168418] N87-11988
Graphics Interface 1986: Proceedings [ISSN-0713-5424] N87-12175
A user's guide to the socioeconomic environmental demographic information system (SEEDIS) [AD-A168917] N87-12388
PDES logical layer initiation tasks [DE86-012289] N87-12392
Federal government information technology: Management, security and congressional oversight [PB86-205499] N87-12397

INFRARED ASTRONOMY
Measurement of H02 and other trace gases in the stratosphere using a high resolution far-infrared spectrometer at 28 KM [NASA-CR-179898] N87-12069
Reports of planetary astronomy, 1985 [NASA-TM-89189] N87-12407
Advanced infrared astronomy N87-12411
Research in planetary astronomy and operation of the 2.2-meter telescope N87-12419
Planetary infrared astronomy using a cryogenic postdisperser on Fourier transform spectrometers N87-12422
Infrared observations of outer planet satellites N87-12423
High annular resolution stellar interferometry [AD-A168755] N87-12498

INFRARED IMAGERY
Design study of a push-broom imager for the thermal infrared [MATRA-094/PH/UB/137.85] N87-12346
International Halley Watch: Discipline specialists for infrared spectroscopy and radiometry N87-12494
Astronomical observations with an infrared array camera N87-12500

INFRARED INTERFEROMETERS
Speckle interferometry applied to asteroids and other solar system objects N87-12449

INFRARED PHOTOMETRY
Infrared imaging and photometry of Comet Giacobini-Zinner N87-12447
Infrared photometry of periodic comets N87-12453
Table Mountain Observatory support to other programs N87-12454
Asteroid shapes and pole orientation from visual and infrared photometry N87-12474
Physical properties of asteroids N87-12475

INFRARED RADIATION
Mathematical and statistical analysis [AD-A169277] N87-11830
A study in the variation in atmospheric transmission of different temperature blackbody sources in the 3.85 - 4.85 micron waveband [BAE-BT-16206] N87-12076
Analyses of the atmospheric aerosol extinction in the 0.5 to 14 micron region [FOA-C-30386-E1,E3] N87-12091

INFRARED REFLECTION
Development/Applications of FT-IR ATR (Fourier Transform IR Attenuated Total Internal Reflection) and photoacoustic dichroism techniques for structural characterization of polymer surfaces [AD-A168519] N87-11894

INFRARED SPECTRA
Infrared spectral studies of asteroids N87-12441
Infrared observations of small solar-system bodies N87-12446
Infrared imaging and photometry of Comet Giacobini-Zinner N87-12447
Planetary spectroscopy N87-12450
Cometary spectroscopy N87-12458
Infrared observations of planets N87-12459
Planet-crossing asteroids: Interrelationships within the solar system N87-12462
Passive microwave remote sensing of the asteroids using the VLA: Continuation N87-12476
International Halley Watch: Discipline specialists for spectroscopy and spectrophotometry N87-12496

INFRARED SPECTROMETERS
Measurement of H02 and other trace gases in the stratosphere using a high resolution far-infrared spectrometer at 28 KM [NASA-CR-179898] N87-12069
Planetary infrared astronomy using a cryogenic postdisperser on Fourier transform spectrometers N87-12422

INFRARED SPECTROSCOPY
Development/Applications of FT-IR ATR (Fourier Transform IR Attenuated Total Internal Reflection) and photoacoustic dichroism techniques for structural characterization of polymer surfaces [AD-A168519] N87-11894
Infrared spectroscopy of Jupiter and Saturn N87-12425
Infrared observations of planetary atmospheres N87-12430
Study of comets at wavelengths between 0.5 and 18 microns N87-12466
Planetary optical and infrared imaging N87-12487
International Halley Watch: Discipline specialists for infrared spectroscopy and radiometry N87-12494

INITIATORS (EXPLOSIVES)
Hot-spot model for calculating the threshold for shock initiation of pyrotechnic mixtures [DE86-011638] N87-11866

INLET FLOW
Investigation of the external flow analysis for density measurements at high altitude [NASA-CR-172464] N87-11880

INORGANIC COMPOUNDS
Application of computer techniques in the prediction of inorganic compounds [PB86-205762] N87-11870

INSOLATION
A study of the radiation balance of the Amazon Forest [INPE-3956-PRE/974] N87-12081

INSPECTION
High performance liquid chromatography of propellants. Part 1: Analysis of M1, M6, and M10 propellants [AD-A168206] N87-11903
Ultrasonic imaging and automated flaw detection system [AD-A168195] N87-12011

INSTRUMENT COMPENSATION
Investigation of magnetometer errors and their compensation in the BO-105 helicopter [DFVLR-FB-86-21] N87-11784
Instrumentation tools for program testing [INPE-3983-TDL/236] N87-12249

INSTRUMENT ERRORS
Investigation of magnetometer errors and their compensation in the BO-105 helicopter [DFVLR-FB-86-21] N87-11784

INTAKE SYSTEMS
Drag and pressure recovery characteristics of auxiliary air inlets at subsonic speeds [ESDU-86002] N87-11892

INTEGRALS
Stochastic integration for operator valued processes on Hilbert spaces and on nuclear spaces [AD-A168501] N87-12315

INTEGRATED CIRCUITS
Method for producing a thin polyimide film on a silicon substrate — integrated circuits [BAE-BT-14610] N87-11899
Pulse Code Modulation (PCM) encoder handbook for Aydin Vector MMP-600 series system [NASA-RP-1171] N87-11916

Proposition of a design methodology for integrated communication circuits. Implementation of a circuit for the PIP local network
[ETN-96-98399] N87-11934
Submicrometer resolution etching of integrated circuit materials with laser-generated atomic fluorine
[ATR-85(8347)-1] N87-11936
VLSI (Very Large Scale Integrated circuits) implementation of a quantized sinusoid filter algorithm and its use to compute the discrete Fourier transform, part 2
[AD-A168605] N87-11942
LSI/VLSI ion implanted planar GaAs IC processing
[AD-A168786] N87-12366
High speed compound semiconductor devices in layered structures
[AD-A168666] N87-12368

INTEGRATED ENERGY SYSTEMS
A user's guide to the socioeconomic environmental demographic information system (SEEDIS)
[AD-A168917] N87-12366

INTERCALATION
Simultaneous electrical resistivity and mass uptake measurements in bromine intercalated fibers
[NASA-TM-89900] N87-11941

INTERCRANIAL CIRCULATION
Professional work capacity and functional state of operator exposed to repeated optokinetic and antiorthostatic factors N87-12110

INTERFACES
On optimal design for the blade-root/hub interface in jet engines N87-11759
Interfacial properties of germanium nitride dielectric layers in germanium
[AD-A168332] N87-12362

INTERFACIAL TENSION
Modeling of infiltration kinetics and interfacial bond strength in aluminum matrix-silicon carbide composites
[AD-A170480] N87-11853

INTERGALACTIC MEDIA
Galaxy groups: Neutral hydrogen and dynamics N87-12512

INTERGRANULAR CORROSION
Performance demonstration tests for detection of intergranular stress corrosion cracking
[TI86-007984] N87-11886

INTERMETALLICS
The elastic constants of NiAl to 1.4 GPa
[AD-A168813] N87-11879

INTERNAL COMBUSTION ENGINES
Advanced Gas Turbine (AGT) Technology Project
[NASA-CR-179484] N87-11995
Preliminary turbulence length scale measurements in a motored IC engine
[DE86-008171] N87-11999
Integrated natural gas engine cooling jacket vapor compressor program, phase 1A
[PB86-215662] N87-12009

INTERNAL WAVES
Nonlinear internal gravity wave propagation, saturation and absorption in the atmosphere
[AD-A170244] N87-12074

INTERNATIONAL COOPERATION
Space activities of western Europe
[AD-A168424] N87-11807
TASS reports VEGAS-1 encounter with Halley's Comet N87-11812

INTERPLANETARY DUST
Interplanetary and interstellar dust N87-12488

INTERPLANETARY MEDIUM
Stellar observations with the Voyager EUV objective grating spectrograph N87-12484

INTERPLANETARY SPACE
Conceptual design of a synoptic interplanetary monitor platform at L sub 1 (SIMPL)
[AD-A168522] N87-11828

INTERPOLATION
Keyframe-based subactors N87-12208

INTERPROCESSOR COMMUNICATION
Implementation of the Twente University Multiprocessor (TUMULT)-15 network interface for the VME bus
[INF-88-11] N87-12272
Dynamic grid manipulation for PDEs (Partial Differential Equations) on hypercube parallel processors
[AD-A168679] N87-12296

INTERSTELLAR MATTER
Interplanetary and interstellar dust N87-12488

INTOXICATION
Paramedium test for toxic substances in human blood during simulated weightlessness N87-12115

INTRAVEHICULAR ACTIVITY
The space station: Human factors and productivity
[NASA-CR-179805] N87-12166

INVENTIONS
Plurality of processors where access to the common memory requires only a single clock interval
[AD-D012385] N87-12269

INVERSIONS
Inversion of ocean data
[AD-A168676] N87-12099

INVERTERS
Utility-interactive inverter using the dc current-source approach
[DE86-012135] N87-11952

INVISCID FLOW
A viscous/inviscid zonal method for the computation of 2 and 3-dimensional compressible fluid flows with separation N87-11958

IO
Infrared observations of outer planet satellites N87-12423

ION DENSITY (CONCENTRATION)
Investigation on acidity-forming ions in wet and dry deposition during the winter season 1984/85
[DFVLR-FB-86-15] N87-12082

ION IMPLANTATION
Materials science and engineering at the Oak Ridge National Laboratory. Abstracts
[DE86-011477] N87-11842
LSI/VLSI ion implanted planar GaAs IC processing
[AD-A168786] N87-12366

ION IRRADIATION
Topical Meeting on Microphysics of Surfaces, Beams and Adsorbates held at Santa Fe, New Mexico on 4 - 8 February 1985
[AD-A168618] N87-12364

IONIZATION
A study of laser induced ionization of alkali metal vapours based on saturation of the first resonance transition
[UTIS-299] N87-11987
Theoretical behavior of fully ionized multiple species magnetized plasmas under rotation
[INPE-3915-RPE-510] N87-12349
A computational study of the influence of molecular nitrogen and laser absorption on plasma channel formation created by laser resonance saturation of sodium vapor
[UTIAS-292] N87-12350
Semiconductor superlattice photodetectors
[NASA-CR-179850] N87-12355

IONOSPHERE
HF (High Frequency) absolute time of arrival sensing
[AD-A168275] N87-11917

IONS
A Monte Carlo description of the sampling of stratospheric ion clusters via a mass spectrometer
[AD-A168525] N87-12071

IOWA
Geochemistry and origin of regional dolomites
[DE86-012788] N87-12077

IRRADIATION
Effects of microwave radiation on the blood-brain barrier
[PB86-213220] N87-12158

ISOLATORS
Data link isolator
[DIGEL-52] N87-11933

ITERATION
Application of viscous-inviscid interaction methods to transonic turbulent flows
[NASA-CR-179900] N87-11700
Multidisciplinary systems optimization by linear decomposition N87-11740

ITERATIVE SOLUTION
PIAS: A program for an iterative aeroelastic solution N87-11725

IUE
Chromospheric activity of cool giant stars
[NASA-CR-177184] N87-12510

J

J INTEGRAL
Application of the key curve and multi-specimen techniques to dynamic J-R curve testing of alloy steel
[TI86-901252] N87-11887

JET ENGINE FUELS
F100 fuel sampling analysis: Foreign samples
[AD-A168573] N87-11904
Aviation turbine fuels, 1985
[DE86-012140] N87-11908

JET ENGINES
On optimal design for the blade-root/hub interface in jet engines N87-11759
Technology development for small high speed, mainshaft roller bearings
[AD-A168684] N87-11996

JET FLOW
Monte Carlo simulation of free jet flow from a slit, revision 1
[DE86-011877] N87-11975

JET STREAMS (METEOROLOGY)
Clear air turbulence analysis using isentropic methods
[AD-A168400] N87-12088

JOINTS (JUNCTIONS)
Joining methods for beryllium: A survey
[DE86-012000] N87-12002
The interactive specification of human animation N87-12195
Modeling and animating three-dimensional articulate figures N87-12199

JOURNAL BEARINGS
Effect of vibration amplitude on vapor cavitation in journal bearings
[NASA-TM-88826] N87-11962

JP-4 JET FUEL
F100 fuel sampling analysis: Foreign samples
[AD-A168573] N87-11904

JP-5 JET FUEL
F100 fuel sampling analysis: Foreign samples
[AD-A168573] N87-11904

JUPITER (PLANET)
Studies of extended planetary atmospheres N87-12421
Infrared spectroscopy of Jupiter and Saturn N87-12425
Ground-based studies of Jupiter, Uranus, and Neptune in support of the Galileo and Voyager missions N87-12434
Analysis of Jovian decametric data: Study of radio emission mechanisms N87-12436
Planetary Fabry-Perot spectroscopy N87-12437
Pioneer 10 and 11 (Jupiter and Saturn) magnetic field experiments
[NASA-CR-179656] N87-12520

JUPITER ATMOSPHERE
Long-term changes in reflectivity and larger scale motions in the atmospheres of Jupiter and Saturn N87-12412
Ground-based observations of the Jupiter plasma torus N87-12432

JUPITER SATELLITES
Search for volatiles in the surface of icy satellites N87-12414

K

KALMAN FILTERS
Geostationary orbital estimation using a Kalman filter
[UTIAS-242] N87-11816

KERNEL FUNCTIONS
DFR (Decreasing Failure Rate) property of first passage times and its preservation under geometric compounding
[AD-A168671] N87-12304

KEROSENE
Antimisting kerosene: Evaluation of low temperature performance
[DOT/FAA/CT-85/31] N87-11902

KINEMATIC EQUATIONS
Application of satellite data to the variational analysis of the three dimensional wind field
[NASA-CR-4022] N87-12084
Mathematical model of human kinematic reactions to impacts N87-12130

KINEMATICS
Kinematic and geometric modelling and animation of robots N87-12178
Animating human figures: Perspectives and directions N87-12194
VIRYA: A motion control editor for kinematic and dynamic animation N87-12197
Modeling and animating three-dimensional articulate figures N87-12199

KINETICS
Modeling of infiltration kinetics and interfacial bond strength in aluminum matrix-silicon carbide composites
[AD-A170480] N87-11853

KNOWLEDGE
On the utilization of engineering knowledge in design optimization N87-11777
The extraction of knowledge from data: An evaluation of Intelligent Knowledge Based Systems (IKBS) — image processing
[BAE-BT-18035] N87-12276

L

LABORATORIES
National Severe Storms Laboratory, fiscal year 1985
[PB86-200841] N87-12086

LAMINAR BOUNDARY LAYER
Analysis of compressible boundary layer with real gas effects N87-11680

Asymptotic solutions to compressible laminar boundary-layer solutions for dusty-gas flow over a semi-infinite flat plate
[UTIAS-310] N87-11967

LAMINATES
Impact and residual fatigue behavior of ARALL and A56/5245 composite materials
[NASA-TM-89013] N87-11848
Automated tape laying machine for composite structures
[AD-D012366] N87-11851
Fretting fatigue of carbon fiber reinforced plastic laminates
[DFVLR-FB-86-18] N87-11855

LANDFORMS
A numerical study of diffraction in reentrant geologic structure
[AD-A168562] N87-12072

LANDING SITES
Electroluminescent (EL) remotely-controlled landing zone marker light system
[AD-D012366] N87-11716

LANDSAT SATELLITES
TM band combination for crop discrimination
[INPE-3905-PRE/946] N87-12031
Tectonic evaluation of the Nubian shield of Northeastern Sudan using thematic mapper imagery
[NASA-CR-177045] N87-12070

LARGE SPACE STRUCTURES
Microcomputer design and analysis of the cable catenary large space antenna system N87-11762
Qualitative results for distributed systems with discrete and stiffness with application to control
[AD-A168622] N87-11829
A study of large space structures
[LR46869] N87-11832

LASER ALTIMETERS
Laser based information systems (selected pages)
[AD-A168418] N87-11988

LASER APPLICATIONS
A study of laser induced ionization of alkali metal vapours based on saturation of the first resonance transition
[UTIS-299] N87-11987
Absorption of CO2 laser beams by metallic alloys. Application to laser thermal treatment
[ISL-CO-217/85] N87-11990
A computational study of the influence of molecular nitrogen and laser absorption on plasma channel formation created by laser resonance saturation of sodium vapor
[UTIAS-292] N87-12350

LASER CUTTING
Submicrometer resolution etching of integrated circuit materials with laser-generated atomic fluorine
[ATR-85(8347)-1] N87-11939

LASER DAMAGE
Ocular hazards associated with laser exposure
[AD-A168506] N87-12151

LASER DOPPLER VELOCIMETERS
Velocity measurements for turbulent nonseparated flow over solid waves
[AD-A168682] N87-11971
Preliminary turbulence length scale measurements in a motored IC engine
[DE86-008171] N87-11986

LASER GYROSCOPES
Laser based information systems (selected pages)
[AD-A168418] N87-11988

LASER INDUCED FLUORESCENCE
Topical Meeting on Microphysics of Surfaces, Beams and Adsorbates held at Santa Fe, New Mexico on 4 - 6 February 1985
[AD-A168618] N87-12384

LASER OUTPUTS
Space-based laser-driven MHD generator: Feasibility study
[NASA-CR-178194] N87-11837
Optical phase conjugation via four-wave mixing in barium titanate
[AD-A168908] N87-12341

LASER PLASMAS
A computational study of the influence of molecular nitrogen and laser absorption on plasma channel formation created by laser resonance saturation of sodium vapor
[UTIAS-292] N87-12350

LASER PUMPING
A computational study of the influence of molecular nitrogen and laser absorption on plasma channel formation created by laser resonance saturation of sodium vapor
[UTIAS-292] N87-12350

LASER RANGE FINDERS
Laser based information systems (selected pages)
[AD-A168418] N87-11988

LASER SPECTROMETERS
Advanced infrared astronomy N87-12411

LASER SPECTROSCOPY
Combustion gas spectroscopy using tunable lasers
[DE86-012873] N87-11986
Spectroscopic planetary detection N87-12481

LASERS
Lifetimes and quenching of the B state of PO by atmospheric gases
[AD-A168736] N87-11980
Large optics technology
[AD-A168222] N87-12339

LATE STARS
Chromospheric activity of cool giant stars
[NASA-CR-177184] N87-12510

LATTICE VIBRATIONS
Geometric structure, pseudo band gaps, and surface vibrational resonances on metal surfaces
[AD-A168291] N87-11876
User manual for BUNVIS-RG: An exact buckling and vibration program for lattice structures, with repetitive geometry and substructuring options
[NASA-TM-87669] N87-12018

LATTICES (MATHEMATICS)
The nonlinear sigma model: Three loops renormalization and lattice scaling
[PREPRINT-486] N87-12313
The discrete site sticky wall model
[AD-A168910] N87-12370

LAUNCH VEHICLES
Proposal for reaching an optimization of a solid combustion vehicle satellite launcher and its trajectory
[INPE-3968-TDL/232] N87-11822

LEADING EDGES
An experimental study of the aerodynamics of a NACA 0012 airfoil with a simulated glaze ice accretion
[NASA-CR-179697] N87-11701
PIAS: A program for an iterative aeroelastic solution N87-11725

LEARNING THEORY
A dynamic model for airframe cost estimation
[AD-A168842] N87-11887

LEAST SQUARES METHOD
Component testing for dynamic model verification N87-11785
Geostationary orbital estimation using a Kalman filter
[UTIAS-242] N87-11816
A note on nonlinear approaches to linear programming
[AD-A168696] N87-12253
Nonlinear approaches to linear programming
[DE86-010692] N87-12254
Optimal sampling rates for auto regressive models
[AD-A168740] N87-12298
On the use of ridge and Stein-type estimators in prediction
[AD-A168349] N87-12302

LEG (ANATOMY)
In vivo nuclear magnetic resonance imaging
[NASA-CR-179902] N87-12328

LENS DESIGN
Visual-optical assessment of thresholds of object distortion due to lens defects in flat glass of vehicle cabins N87-12131

LENSES
Large optics technology
[AD-A168222] N87-12339

LIBRARIES
National Energy Software Center
[DE86-010515] N87-12391
NTIS (National Technical Information Service) privatization study responses to April 28, 1986 Federal register notice request for public comment
[PB86-211240] N87-12396

LIBRATIONAL MOTION
Analytical investigation of the dynamics of tethered constellations in Earth orbit, phase 2
[NASA-CR-179953] N87-11815

LIE GROUPS
Relation between tau-functions as determinants and group orbits: Plucker relations
[MEMO-569] N87-12316
Multichannel nonpotential scattering theory
[PREPRINT-476] N87-12333

LIFE (DURABILITY)
Effect of hard particle impacts on the atomic oxygen survivability of reflector surfaces with transparent protective overcoats
[NASA-TM-89874] N87-11838
Thermal barrier coating life prediction model development
[NASA-CR-179508] N87-11892
Selection of rolling-element bearing steels for long-life application
[NASA-TM-88861] N87-11993
System safety procedures for nondevelopment item (NDI) acquisitions
[AD-A168353] N87-12012

LIFE SCIENCES
USSR report: Space
[JPRS-USP-86-005] N87-11909
Philosophical aspects of adaptation theory N87-12106
Research and technology
[NASA-TM-86852] N87-12530

LIFT
Contribution to the analysis of high-lift airfoil aerodynamics
[AD-A168401] N87-11703
Lift and drag measurements on a towing tank model of a tip vane turbine
[W-R512] N87-11980

LIFT DRAG RATIO
Maximum lift/drag ratio of flat plates with bluntness and skin friction at hypersonic speeds
[NASA-TM-88338] N87-11896

LIGHT CURVE
Observations of comets and asteroids N87-12439
Planetary research at Lowell Observatory N87-12440
Photometry of small asteroids and cometary cores N87-12451
Pole orientation, sidereal period, and sense of rotation of asteroids N87-12473

LIGHT SCATTERING
Studies of asteroids and comets N87-12442

LIGHT SPEED
New experiments to constrain the coefficients of the Robertson transformations for inertial systems
[NASA-CR-179908] N87-12320
Spectroscopic planetary detection N87-12481

LIGHTING EQUIPMENT
Electroluminescent (EL) remotely-controlled landing zone marker light system
[AD-D012366] N87-11716

LIGHTNING
Atmospheric electrical modeling in support of the NASA F106 Storm Hazards Project
[NASA-CR-179901] N87-12062

LINE SPECTRA
Composition of faint comets N87-12445
International Halley Watch: Discipline specialists for spectroscopy and spectrophotometry N87-12496
The emission lines from accretion disks in cataclysmic variable systems N87-12513

LINEAR ACCELERATORS
High energy electron radiation degradation of gallium arsenide solar cells
[AD-A168402] N87-12050
Supersymmetry: Proceedings
[DE86-007853] N87-12334

LINEAR PROGRAMMING
A note on nonlinear approaches to linear programming
[AD-A168696] N87-12253
Nonlinear approaches to linear programming
[DE86-010692] N87-12254
Generalized network implementations
[AD-A168296] N87-12286

LINEAR SYSTEMS
Analysis and regulation of nonlinear and generalized linear systems
[AD-A168615] N87-12284
Optimal sampling rates for auto regressive models
[AD-A168740] N87-12298

LINES (GEOMETRY)
Contour line region segmentation N87-12240

LINKAGES
Stretched cusps in coupler curves: Four-bar linkages having Ball-modal-coupler points
[EUT-84-W-001] N87-12008

LIPID METABOLISM
Biochemical indicators of emotional stress in air traffic controllers N87-12129

LIQUID CHROMATOGRAPHY
High performance liquid chromatography of propellants. Part 1: Analysis of M1, M8, and M10 propellants
[AD-A168206] N87-11903

LIQUID CRYSTALS
Analysis of the liquid crystal light valve using Bi12SiO20 as the photoconductor
[LR49625] N87-12375
A model for the liquid crystal light valve. Part 1: Analysis of charge trapping in the BSO and its effect on the device resolution
[BAE-BT-15603] N87-12376

LIQUID HYDROGEN
Safety aspects of large-scale combustion of hydrogen
[DE86-007375] N87-11864

LIQUID PHASES
The discrete site sticky wall model
[AD-A168910] N87-12370

LIQUIDS
Measurement and prediction of liquid mixture thermal conductivity and viscosity
[DE86-012006] N87-11877
LITERATURE
Joining methods for beryllium: A survey
[DE86-012000] N87-12002
LITHIUM FLUORIDES
Studies of strain rate effects in the deformation of solids by means of stress pulses and ultrasonic methods
[DE86-012208] N87-12025
LITHIUM OXIDES
The effect of high pressure on electrical relaxation in PPO and electrical conductivity in PPO complexed with lithium salts
[AD-A168684] N87-11862
LITHIUM SULFUR BATTERIES
Studies of high reliability long-life Li/SO sub 2 cells
[DE86-010478] N87-11947
LITHOGRAPHY
Submicrometer resolution etching of integrated circuit materials with laser-generated atomic fluorine
[ATR-85(8347)-1] N87-11939
LOAD TESTS
Application of the key curve and multi-specimen techniques to dynamic J-R curve testing of alloy steel
[TIS6-901252] N87-11867
Verifying strain gage installations for dynamic tests
[DE86-006480] N87-11965
LOADING RATE
Application of the key curve and multi-specimen techniques to dynamic J-R curve testing of alloy steel
[TIS6-901252] N87-11867
LOADS (FORCES)
Calculation methods for steadily loaded axial groove hydrodynamic journal bearings. Low viscosity process fluid lubrication.
[ESDU-86006] N87-11991
Vertical deflection characteristics of aircraft tyres
[ESDU-86005] N87-11992
Applying, measuring and maintaining pretension in steel bolts
[ESDU-86014] N87-12015
Dugdale model for circumferential through-cracks in pipes loaded by bending
[AD-A170260] N87-12024
Near-real-time control of human figure models
N87-12196
LOCAL AREA NETWORKS
ELAND: An expert system for the configuration of local area networks applications
[REPT-86-009] N87-12270
Local area networks: Characteristics, properties, and standardization
[SWA-85/193] N87-12271
LOGIC CIRCUITS
Static series voltage margin of I2L — transistors
[REPT-86SO] N87-11955
LOGIC DESIGN
Selective backtracking
[INPE-3867-TDL/219] N87-12274
Logical treatment of knowledge semantic integrity and organization in data base management systems
[ETN-86-96398] N87-12306
LOGIC PROGRAMMING
Selective backtracking
[INPE-3867-TDL/219] N87-12274
LONG DURATION SPACE FLIGHT
Interview on medical program of 237-day flight
N87-11814
Preliminary results of medical investigations during 5-month spaceflight aboard Salyut-7-Soyuz-T orbital complex N87-12109
Venous pressure in jugular vein system and effectiveness of blood return to right heart during 120-day head-down tilt N87-12111
Reclamation of water used for washing by means of reverse osmosis during long-term spaceflights
N87-12120
Endocrine status of cosmonauts following long-term space missions N87-12146
LOSSES
Calorimetric measurements of the equivalent series resistance of low-loss, high repetition rate pulse discharge capacitors
[DE86-011232] N87-11948
Losses in fountain-effect pumps
[NASA-TM-88232] N87-11966
LOW COST
Plurality of processors where access to the common memory requires only a single clock interval
[AD-D012386] N87-12260
LOW FREQUENCIES
Modeling and investigative studies of Jovian low frequency emissions N87-12427
LOW SPEED WIND TUNNELS
The 8 m x 6 m low speed wind tunnel at the Chinese Aerodynamic Research and Development Center
[AD-A168445] N87-11803
LOW TEMPERATURE ENVIRONMENTS
Ground aircraft deicing technology review
[DOT/FAA/CT-85/21] N87-11707
LOWER ATMOSPHERE
Wind profiling of stormy and quiescent atmospheres with microwave radars
[PB86-212545] N87-12094
LOWER BODY NEGATIVE PRESSURE
Preliminary results of medical investigations during 5-month spaceflight aboard Salyut-7-Soyuz-T orbital complex N87-12109
LUBRICANT TESTS
Activities report in space tribology
[ESA-ESTL-77] N87-12005
LUBRICANTS
Calculation methods for steadily loaded axial groove hydrodynamic journal bearings. Low viscosity process fluid lubrication.
[ESDU-86006] N87-11991
Applying, measuring and maintaining pretension in steel bolts
[ESDU-86014] N87-12015
LUNAR MARIA
Basalt depths in lunar basins using impact craters as stratigraphic probes: Evaluation of a method using orbital geochemical data
[NASA-CR-179658] N87-12521
LUNAR OCCULTATION
The observation and analysis of lunar occultations of stars with an emphasis on improvements to data acquisition instrumentation and reduction techniques
N87-12501

M

MACH NUMBER
Pilot-pressure measurements in flow fields behind a rectangular nozzle with exhaust jet for free-stream Mach numbers of 0.00, 0.60, and 1.20
[NASA-TM-88990] N87-11696
MACHINING
Evaluation of waterjet-machined metal matrix composite tensile specimens
[DE86-012254] N87-11854
MAGNETIC FIELDS
Audiomagnetotelluric (AMT) system
[DE86-011274] N87-11986
Simultaneous Solar Maximum Mission (SMM) and very large array observations of solar active regions
[NASA-CR-177187] N87-12522
Large-scale structure and dynamics of solar active regions observed in the far ultraviolet N87-12527
MAGNETIC MIRRORS
Radial Fokker-Planck model for plasmas confined by magnetic mirror fields
[DE86-012225] N87-12353
MAGNETIC PERMEABILITY
Techniques for microwave dielectric measurements
[AD-A168300] N87-11919
MAGNETIC RECORDING
Specialized equipment for magnetic recording of physiological data for experiments aboard biosatellites
N87-12144
MAGNETIC SIGNATURES
Large-scale structure and dynamics of solar active regions observed in the far ultraviolet N87-12527
MAGNETIC STORAGE
A solid state data recorder for space-based applications using magnetic bubble memory
[AD-A168909] N87-11984
MAGNETIC STORMS
Pioneer 10 and 11 (Jupiter and Saturn) magnetic field experiments
[NASA-CR-179656] N87-12520
MAGNETIC SURVEYS
Audiomagnetotelluric (AMT) system
[DE86-011274] N87-11986
MAGNETIC SWITCHING
Alternator-driven, magnetically switched modulator
[DE86-012189] N87-11949
MAGNETIZATION
Theoretical behavior of fully ionized multiple species magnetized plasmas under rotation
[INPE-3915-RPE-510] N87-12349
MAGNETOHYDRODYNAMIC GENERATORS
Space-based laser-driven MHD generator: Feasibility study
[NASA-CR-179184] N87-11837
MAGNETOHYDRODYNAMIC WAVES
Magnetohydrodynamic shocks in molecular clouds
N87-12364
Analysis of Jovian decametric data: Study of radio emission mechanisms N87-12438
MAGNETOMETERS
Investigation of magnetometer errors and their compensation in the BO-105 helicopter
[DFVLR-FB-86-21] N87-11784
MAGNETOSPHERE
Non-Maxwellian free-energy generation in the magnetotail due to chaotic particle motion
[AD-A168504] N87-12381
Pioneer 10 and 11 (Jupiter and Saturn) magnetic field experiments
[NASA-CR-179656] N87-12520
MAGNETOSTATICS
Application of program POISSON to axially-symmetric problems - magnetostatic and electrostatic - with use of a prolate spheroidal boundary
[DE86-012826] N87-12258
MAGNITUDE
Reconstruction of two-dimensional signals from the Fourier transform magnitude
[AD-A168792] N87-12299
MALI
Environmental processes and spectral reflectance characteristics associated with soil erosion in desert fringe regions
[NASA-CR-179729] N87-12536
MAN MACHINE SYSTEMS
Constraint-based modeling of three-dimensional shapes N87-12200
MAN-COMPUTER INTERFACE
An editing model for generating graphical user interfaces N87-12188
Automatic generation of graphical user interfaces
N87-12187
Constraint-based modeling of three-dimensional shapes N87-12200
Learning graphics programming by direct communication N87-12254
Eliminating the dichotomy between scripting and interaction N87-12206
MANAGEMENT ANALYSIS
Approximate evaluation of reliability and availability via perturbation analysis
[AD-A168581] N87-12014
MANAGEMENT METHODS
The inference machine laboratory: Graphic tools for knowledge management N87-12180
Managing software complexity
[ERL-0372-RE] N87-12348
Generalized network implementations
[AD-A168298] N87-12298
Use of fuzzy sets mathematics to assist pavement evaluation and management. Executive summary (revised March 18, 1986)
[PB86-214780] N87-12298
MANIPULATORS
Active control of robot manipulator compliance
[NASA-CR-177183] N87-11984
MANNED MANEUVERING UNITS
Computer simulation of on-orbit manned maneuvering unit operations
[NASA-CR-179904] N87-12345
MANNED SPACE FLIGHT
USSR report: Space
[JPRS-USP-86-005] N87-11808
Commentary, diagram of MIR station N87-11810
MANUALS
Technology transfer primer
[PB86-205341] N87-12404
MANUFACTURING
Automated tape laying machine for composite structures
[AD-D012386] N87-11981
Activities report in metal structures industry scientific and technical sector
[ISSN-0524-7705] N87-11989
A research planning assessment for applications of artificial intelligence in manufacturing
[AD-A168692] N87-12252
MANY BODY PROBLEM
Calculation of potential energy surfaces for HCO and HNO using many-body methods
[AD-A169811] N87-11969
MAPPING
Research in expert interactive cartographic systems
[AD-A168337] N87-12041
A cel-based model for paint systems N87-12189
Applications of world projections N87-12190
Survey of texture mapping N87-12207
Integration of remotely sensed data and geographic information systems N87-12216
Map/image congruency evaluation knowledge based system N87-12219
A file organization scheme for polygon data
N87-12221

Contour line region segmentation N87-12240
Army technology development. IBIS query. Software to support the Image Based Information System (IBIS) expansion for mapping, charting and geodesy
[AD-A169609] N87-12369

MAPS
Two-dimensional polygonal representation of maps for use with autonomous vehicle route planning
[AD-A170301] N87-12044
Real time oceanographic analysis for the south western Australian area for July 1984 to August 1985
[AD-A168741] N87-12100

MARGINS
Static series voltage margin of I2L — transistors
[REPT-85SO] N87-11955

MARKOV PROCESSES
Comparisons of the two-state Markov and Fritchman models as applied to bit error statistics in communication channels
[PB86-213485] N87-11935
DFR (Decreasing Failure Rate) property of first passage times and its preservation under geometric compounding
[AD-A168571] N87-12304
Convergence theorems of sampler processes with applications to image processing
[AD-A170256] N87-12306
A central limit theorem for Markov paths and some properties of Gaussian random fields
[AD-A170258] N87-12307
An approach to a Markovian realization of two-parameter processes
[ENST-85D001] N87-12312

MARS (PLANET)
Submillimeter and millimeter observations of solar system objects N87-12426

MARS ATMOSPHERE
Advanced infrared astronomy N87-12411

MARTINGALES
Approximate counting. A Martingale approach
[AD-A170229] N87-12290

MASKING
A cel-based model for paint systems N87-12189

MASS DISTRIBUTION
Concentrated mass effects on the flutter of a composite advanced turboprop model
[NASA-TM-88854] N87-12017

MASS FLOW
Jets, mass outflows and disks associated with young stellar objects N87-12486

MASS SPECTRA
Mass spectrometric investigation of the thermal decomposition of several propellant and explosive ingredients
[AD-A168611] N87-11905

MASS SPECTROMETERS
A Monte Carlo description of the sampling of stratospheric ion clusters via a mass spectrometer
[AD-A168523] N87-12071

MASS TRANSFER
Simultaneous electrical resistivity and mass uptake measurements in bromine intercalated fibers
[NASA-TM-88900] N87-11841

MATCHED FILTERS
A complex extension of the Hadamard transform for correlation purposes — scene correlation with matched filters
[BAE-BT-14469] N87-12292

MATCHING
Edge-only matching techniques in robot vision N87-12232
Optical character recognition of touching characters N87-12239

MATERIALS HANDLING
National Forum on the Future of Automated Materials Processing in US Industry: The Role of Sensors. Report of a workshop (1st) held at Santa Barbara, California on December 16-17, 1985
[PB86-212040] N87-11912

MATHEMATICAL MODELS
A dynamic model for airframe cost estimation
[AD-A168842] N87-11687
Qualitative results for distributed systems with discrete and stiffness with application to control
[AD-A168622] N87-11829
Mathematical and statistical analysis
[AD-A169277] N87-11830
Size distribution of unburned aluminum particles in solid propellant rocket motor exhaust
[DE86-013376] N87-11840
Finite element modelling of composites, volume 1
[BR97502] N87-11845
Hot-spot model for calculating the threshold for shock initiation of pyrotechnic mixtures
[DE86-011639] N87-11866
Numerical routines for predicting ignition in pyrotechnic devices
[DE86-013251] N87-11909
Technology development for small high speed, mainshaft roller bearings
[AD-A168694] N87-11996
Applying, measuring and maintaining pretension in steel bolts
[ESDU-85014] N87-12015
Analysis of some nonlinear problems. Models of plates and shells
[ETN-86-98404] N87-12026
Photovoltaic technology evaluation
[DE86-010487] N87-12063
A numerical study of diffraction in resistant geologic structure
[AD-A168562] N87-12072
Modification of a variational objective analysis model for new equations for pressure gradient and vertical velocity in the lower troposphere and for spatial resolution and accuracy of satellite data
[NASA-CR-4025] N87-12065
Inversion of ocean data
[AD-A168676] N87-12099
Evaluation of wave calculations using GONO in the period October 1984 - April 1985
[KNMI-TR-79] N87-12102
Graphical applications of L-systems N87-12213
SMP: A solid modeling program version 2.0
[NASA-CR-178183] N87-12244
Application of program POISSON to axially-symmetric problems - magnetostatic and electrostatic - with use of a prolate spheroidal boundary
[DE86-012626] N87-12256
On the use of ridge and Stein-type estimators in prediction
[AD-A168349] N87-12302
Semiconductor superlattice photodetectors
[NASA-CR-179850] N87-12355
Simulation studies for surfaces and materials strength
[NASA-CR-177046] N87-12357
Numerical hydrodynamic models of planetary nebulae N87-12517

MATRICES (MATHEMATICS)
Motion characteristics of the UTIAS flight research simulator motion-base
[UTIAS-TN-261] N87-11802
A fast algorithm for general raster rotation N87-12186

MATRIX MATERIALS
Heat resistant matrix materials — advanced composite materials
[FOA-C-20618-2.1] N87-11856
Expandable epoxy application
[AD-A168669] N87-11895

MAXWELL-BOLTZMANN DENSITY FUNCTION
On the Maxwellian distribution, symmetric form, and entropy conservation for the Euler equations
[NASA-TP-2583] N87-11963

MEAN SQUARE VALUES
Methods for stochastic spectral synthesis N87-12202

MEASUREMENT
On the quantization of anomalous theories — gauge theory
[PREPRINT-473] N87-12321

MEASURING INSTRUMENTS
A second generation experiment in fault-tolerant software
[NASA-CR-179648] N87-12242

MECHANICAL DEVICES
Docking mechanisms technology study
[ESA-CR(P)-2273] N87-11833

MECHANICAL ENGINEERING
Docking mechanisms technology study
[ESA-CR(P)-2273] N87-11833
Activities report in metal structures industry scientific and technical studies
[ISSN-0524-7705] N87-11886

MECHANICAL PROPERTIES
An in-situ study in SEM of delamination in several graphite/epoxy composite material systems
[NASA-CR-179839] N87-11847
Dispersion and blending of SiC (silicon carbide) whiskers in RSP aluminum powders
[AD-A168836] N87-11849
Improvement in ductility and fracture toughness of HIP'd and isothermally forged Ti-6Al-6V-2Sn powder with heat treatment
[AD-A168804] N87-11878
Environmentally stable polymers and coatings for space application: CH-5, supplement 10
[NASA-CR-177181] N87-11890
Studies on the dynamic mechanical properties of the composite modified double-base propellant
[AD-A168799] N87-11907
Hand off integrator apparatus for signal detection
[AD-D012391] N87-11[illegible]

MELT SPINNING
Primary arm spacing in chill block melt spun Ni-Al alloys
[NASA-TM-88897] N87-11975

MEMBRANES
Reclamation of water used for washing by means of reverse osmosis during long-term spaceflights N87-11920

MEMORY (COMPUTERS)
The application of a sparse, distributed memory to the detection, identification and manipulation of physical objects
[NASA-TM-89231] N87-11189
Plurality of processors where access to the common memory requires only a single clock interval
[AD-D012365] N87-12[illegible]

MENTAL PERFORMANCE
Register of research in progress on mental workload
[AD-A168210] N87-12190
Performance regulation and error control in a test of perceptual speed
[DFVLR-FB-86-13] N87-12164

MERCURY (PLANET)
The Arecibo S-band radar program N87-12408
Studies of extended planetary atmospheres N87-12421

MERCURY CADMIUM TELLURIDES
Zone levelling and solution growth of complex compound semiconductors in space
[NASA-CR-179884] N87-12356
Research on mercury cadmium telluride
[AD-A170477] N87-12371

MESH
Advanced construction procedures: Confined bases for airport pavements
[FAA/PM-86/9] N87-11790
User manual for BUNVIS-RG: An exact buckling and vibration program for lattice structures, with repetitive geometry and substructuring options
[NASA-TM-87669] N87-12013

MESSAGE PROCESSING
Graphics tools in Adagio, a robotics multitasking multiprocessor workstation N87-12191

METAL COMPOUNDS
Reductive disproportionation of carbon dioxide by dianionic carbonylmetalates of the transition metals
[AD-A168211] N87-11859

METAL FATIGUE
Grain boundary oxidation and fatigue crack growth at elevated temperatures
[NASA-CR-179529] N87-[illegible]
Fatigue properties of high strength titanium alloys at elevated temperatures (IMI 685)
[DFVLR-FB-86-19] N87-[illegible]

METAL FILMS
Interfacial reactions between amorphous W-Si films and polycrystalline overlayers
[DE86-009869] N87-12[illegible]

METAL MATRIX COMPOSITES
Dispersion and blending of SiC (silicon carbide) whiskers in RSP aluminum powders
[AD-A168836] N87-11849
Statistical strength comparison of metal matrix and polymeric matrix composites
[AD-A168847] N87-12[illegible]
Evaluation of waterjet-machined metal matrix composite tensile specimens
[DE86-012254] N87-11864

METAL PARTICLES
Size distribution of unburned aluminum particles in solid propellant rocket motor exhaust
[DE86-013376] N87-11840

METAL PROPELLANTS
Size distribution of unburned aluminum particles in solid propellant rocket motor exhaust
[DE86-013376] N87-11840

METAL SURFACES
Geometric structure, pseudo band gaps, and surface vibrational resonances on metal surfaces
[AD-A168291] N87-11878
Surface vibrations and (2x1) superstructures on FCC(110) metal surfaces
[AD-A168786] N87-12367

METAL VAPORS
A study of laser induced ionization of alkali metal vapours based on saturation of the first resonance transition
[UTIS-299] N87-11987

METAL WORKING
Activities report in metal structures industry scientific and technical studies
[ISSN-0524-7705] N87-11886

METALS
Discussion of the effect of temperature on the very short term properties of metals and alloys — high speed flight
[BAE-BT-14842] N87-11882
METEORITE CRATERS
Basalt depths in lunar basins using impact craters as stratigraphic probes: Evaluation of a method using orbital geochemical data
[NASA-CR-179858] N87-12521
METEORITES
Infrared spectral studies of asteroids N87-12441
Antarctic meteorite newsletter, volume 9, number 1
[NASA-TM-89230] N87-12506
METEOROLOGICAL CHARTS
World atlas of total sky-cover: Environmental research papers
[AD-A170474] N87-12090
METEOROLOGICAL FLIGHT
Comparative flight measurement of icing parameters for the DO 28 D2 propeller-driven aircraft of the German Army Testing Office 61 and for DFVLR's Falcon 20 E jet aircraft in stratus clouds
[ESA-TT-941] N87-11709
METEOROLOGICAL PARAMETERS
Global atmospheric background monitoring for selected environmental parameters BAPMoN data for 1981. Volume 2: Precipitation chemistry, continuous atmospheric carbon dioxide and suspended particulate matter
[PB86-208360] N87-12065
Monthly and seasonal climatology of the northern winter over the global tropics and subtropics for the period 1974 to 1983. Volume 4: 700
[AD-A168837] N87-12069
Mariners Weather Log, volume 30, number 2, spring 1986
[PB86-213360] N87-12093
METEOROLOGICAL SATELLITES
Conceptual design of a synoptic interplanetary monitor platform at l. sub 1 (SIMPL)
[AD-A168522] N87-11828
Modification of a variational objective analysis model for new equations for pressure gradient and vertical velocity in the lower troposphere and for spatial resolution and accuracy of satellite data
[NASA-CR-4025] N87-12085
METEOSAT SATELLITE
METEOSAT raw image data encryption
[ESA-CR(P)-2234] N87-11932
MICROBIOLOGY
Sanitary and microbiological aspects of closed environment occupied by people and animals N87-12121
MICROCOMPUTERS
Microcomputer design and analysis of the cable catenary large space antenna system N87-11762
Plurality of processors where access to the common memory requires only a single clock interval
[AD-D012385] N87-12269
MICROCRACKS
An in-situ study in SEM of delamination in several graphite/epoxy composite material systems
[NASA-CR-179839] N87-11847
MICROELECTRONICS
High speed compound semiconductor devices in layered structures
[AD-A168666] N87-12368
MICROHARDNESS
Effect of laser hardening on microstructure and wear resistance in medium carbon/chromium steels
[DE86-012021] N87-11880
MICROMETERS
Submicrometer resolution etching of integrated circuit materials with laser-generated atomic fluorine
[ATR-85(8347)-1] N87-11939
MICROMINIATURIZATION
LSI/VLSI ion implanted planar GaAs IC processing
[AD-A168788] N87-12366
MICROPROCESSORS
Audiomagnetotelluric (AMT) system
[DE86-011274] N87-11986
Definition, study and design of a specific self-checking microprocessor COBRA
[ETN-86-99402] N87-12173
Plurality of processors where access to the common memory requires only a single clock interval
[AD-D012385] N87-12269
MICROSTRUCTURE
Materials science and engineering at the Oak Ridge National Laboratory. Abstracts
[DE86-011477] N87-11842
Improvement in ductility and fracture toughness of HIP'd and isothermally forged Ti-6Al-6V-2Sn powder with heat treatment
[AD-A168604] N87-11878
Raman determination of molecular structure and physical properties of dielectric coatings
[DE86-011620] N87-11897
MICROWAVE EMISSION
Microwave emission and scattering from Earth surface and atmosphere
[NASA-CR-177189] N87-12068
MICROWAVE RESONANCE
RF field profiles in weakly irregular open resonators
[INPE-3957-PRE/975] N87-11938
MICROWAVE SCATTERING
Microwave emission and scattering from Earth surface and atmosphere
[NASA-CR-177189] N87-12068
MICROWAVE SENSORS
Passive microwave remote sensing of the asteroids using the VLA: Continuation N87-12476
MICROWAVES
Techniques for microwave dielectric measurements
[AD-A168300] N87-11919
Wind profiling of stormy and quiescent atmospheres with microwave radars
[PB86-212545] N87-12094
Radio-frequency electromagnetic radiation: Radiation safety N87-12107
Effects of microwave radiation on the blood-brain barrier
[PB86-213220] N87-12158
MILITARY TECHNOLOGY
National aeronautical R and D goals: Technology for America's future
[PB86-209772] N87-12405
MILKY WAY GALAXY
Astronomical observations with an infrared array camera N87-12500
MILLIMETER WAVES
Techniques for microwave dielectric measurements
[AD-A168300] N87-11919
Millimeter wave generation by relativistic electron beams
[AD-A168624] N87-12352
Submillimeter and millimeter observations of solar system objects N87-12428
Relative timings of MM-waves and associated M-waves solar bursts
[INPE-4013-PRE/1004] N87-12525
MINERALOGY
Thematic mapper study of Alaskan ophiolites
[NASA-CR-179728] N87-12035
MINERALS
Nature and origin of mineral coatings on volcanic rocks of the Black Mountain, Stonewall Mountain and Kane Springs Wash volcanic centers, southern Nevada
[NASA-CR-179738] N87-12067
MINIMAX TECHNIQUE
On the elementary theorems of decision theory
[AD-A170285] N87-12385
MIRRORS
Nuclear hardening of optical coatings: Enhanced energy sharing concept, revision 1
[DE86-009728] N87-11891
Effect of hard particle impacts on the atomic oxygen survivability of reflector surfaces with transparent protective overcoats
[NASA-TM-88874] N87-11838
Large optics technology
[AD-A168222] N87-12339
MISSILE CONTROL
Optimal redesign study of the harm wing N87-11734
The 8 m x 6 m low speed wind tunnel at the Chinese Aerodynamic Research and Development Center
[AD-A168448] N87-11803
Techniques for microwave dielectric measurements
[AD-A168300] N87-11919
Multiple task oriented processor
[AD-D012392] N87-12170
MISSILE DESIGN
Optimal redesign study of the harm wing N87-11734
MISSILES
Optimal redesign study of the harm wing N87-11734
MISSOURI
Geochemistry and origin of regional dolomites
[DE86-012788] N87-12077
MIXING LENGTH FLOW THEORY
Preliminary turbulence length scale measurements in a motored IC engine
[DE86-006171] N87-11999
MIXTURES
Measurement and prediction of liquid mixture thermal conductivity and viscosity
[DE86-012508] N87-11977
MOBILITY
Image techniques for the identification of depressions and other obstacles in automated guidance of roving robots N87-12224
MODAL RESPONSE
Modal analysis of robots
[WPB-0144] N87-12007
MODELS
The role of optimization in structural model refinement N87-11724
Constraint-based modeling of three-dimensional shapes N87-12200
The stochastic modelling of trees N87-12201
Generalized network implementations
[AD-A168298] N87-12298
The discrete site sticky wall model
[AD-A168910] N87-12370
MODULATORS
Alternator-driven, magnetically switched modulator
[DE86-012189] N87-11949
A model for the liquid crystal light valve. Part 1: Analysis of charge trapping in the BSO and its effect on the device resolution
[BAE-BT-15603] N87-12378
MODULES
Results of the 1986 NASA/JPL Balloon Flight Solar Calibration Program
[NASA-CR-179916] N87-12048
MOLECULAR CLOUDS
Magnetohydrodynamic shocks in molecular clouds N87-12354
MOLECULAR EXCITATION
Calculation of potential energy surfaces for HCO and HNO using many-body methods
[AD-A169611] N87-11883
MOLECULAR GASES
Fundamental study of dense-fluid detonation
[AD-A168753] N87-11906
MOLECULAR INTERACTIONS
Topical Meeting on Microphysics of Surfaces, Beams and Adsorbates held at Santa Fe, New Mexico on 4 - 6 February 1985
[AD-A168618] N87-12364
MOLECULAR OSCILLATIONS
Surface vibrations and (2x1) superstructures on FCC(110) metal surfaces
[AD-A168788] N87-12367
MOLECULAR SPECTRA
Planetary submillimeter spectroscopy N87-12424
Composition of faint comets N87-12445
Spatially resolved quantitative spectroscopy of comets N87-12471
Spectroscopy of comets N87-12478
MOLECULAR STRUCTURE
Raman determination of molecular structure and physical properties of dielectric coatings
[DE86-011620] N87-11897
Molecular characteristics of thermoplastic polyimides as functions different cure cycles
[FOA-C-20603-F9] N87-11898
Statistical mechanics of charged objects: General method and applications to simple systems
[AD-A168918] N87-12329
Synthesis and crystal and molecular structure of In(C5Me5)-An apparent octahedral cluster
[AD-A168281] N87-12360
MOLYBDENUM
Primary arm spacing in chill block melt spun Ni-Mo alloys
[NASA-TM-8688*] N87-11875
MONOTONE FUNCTIONS
Monotonicity of rank statistics in some nonparametric testing problems
[REPT-292] N87-12314
MONTE CARLO METHOD
Investigation of the external flow analysis for density measurements at high altitude
[NASA-CR-172464] N87-11893
Monte Carlo simulation of free jet flow from a slit, revision 1
[DE86-011877] N87-11975
Comparison of maximus/bounding and Bayes/Monte Carlo for fault tree uncertainty analysis
[DE86-011704] N87-12310
MORPHOLOGY
A photometric investigation of the rich supercluster fourteen fifty-one plus twenty-two N87-12507
MOTION
Kinematic and geometric modelling and animation of robots N87-12178
Correspondence in apparent motion: Defining the heuristics N87-12229
Determining displacement fields along contours from image sequences N87-12251
MOTION SICKNESS
Professional work capacity and functional state of operator exposed to repeated optokinetic and antiorthostatic factors N87-12110

Mathematical model of cupuloendolymphatic system with different cupula and endolymph densities — semicircular canals N87-12123
Use of central electroanalgesia for functional recovery from motion sickness N87-12134

MOTION SICKNESS DRUGS
Use of central electroanalgesia for functional recovery from motion sickness N87-12134

MOTION SIMULATION
An encoding scheme for presentation graphics with animation N87-12177
A cel-based model for paint systems N87-12189
Animating human figures: Perspectives and directions N87-12194
The interactive specification of human animation N87-12195
Goal directed animation using English motion commands N87-12196
VIRYA: A motion control editor for kinematic and dynamic animation N87-12197
Near-real-time control of human figure models N87-12198
Modeling and animating three-dimensinal articulate figures N87-12199
Eliminating the dichotomy between scripting and interaction N87-12206
Keyframe-based subactors N87-12208
The representation of water N87-12209

MOTION STABILITY
Analytical investigation of the dynamics of tethered constellations in Earth orbit, phase 2
[NASA-CR-178953] N87-11815

MOTOR VEHICLES
Application of optimization techniques to vehicle design: A review N87-11726

MOVING TARGET INDICATORS
Satellite tracking and observability
[AD-A168394] N87-11818
Laser beand information systems (selected pages)
[AD-A168418] N87-11988

MUFFLERS
Numerical study of the damping of acoustic waves in a duct with splitter plates
[MPIS-20/1985] N87-12324

MULTIPROCESSING (COMPUTERS)
Multiple task oriented processor
[AD-D012392] N87-12170
Graphics tools in Adagio, a robotics multitasking multiprocessor workstation N87-12191
Plurality of processors where access to the common memory requires only a single clock interval
[AD-D012395] N87-12269

MULTISPECTRAL BAND SCANNERS
TM band combination for crop discrimination
[INPE-3905-PRE/948] N87-12031

MULTISPECTRAL PHOTOGRAPHY
Teledetection by aquatic plants. Investigation of the possibilities of multispectral photography and spectroradiometry
[VLT-1985-11] N87-12045

MULTIVARIATE STATISTICAL ANALYSIS
Estimating jointly system and component reliabilities using a mutual censorship approach
[AD-A168544] N87-12013
Asymptotic distributions of functions of the eigenvalues of the sample covariance matrix and canonical correlation matrix in multivariate time series
[AD-A170262] N87-12306

MUSCLES
Distinctions of capillarization of white rat skeletal muscle during adaptation to high altitude of the Pamirs and Antarctica N87-12117
Interfacing image processing and computer graphics systems using an artificial visual system N87-12210
In vivo nuclear magnetic resonance imaging
[NASA-CR-179902] N87-12326

MUSCULAR FATIGUE
Use of gas mixtures with high oxygen and carbon dioxide content to normalize external respiration and blood acid-base equilibrium in presence of muscle fatigue N87-12132
Skeletal muscle fatigue: Physiological and biochemical studies N87-12159

MUSCULAR FUNCTION
Norepinephrine used to control energy of heat production and utilization of ATP in single muscular contraction under normal and hypercalc conditions N87-12141
Skeletal muscle fatigue: Physiological and biochemical studies N87-12159

MUSCULAR STRENGTH
Relationship of field tests to laboratory tests of muscular strength and endurance, and maximal aerobic power
[AD-A168260] N87-12150

MUSCULOSKELETAL SYSTEM
Effect of weightlessness on rat fetus skeletal development N87-12139

N

NARROWBAND
Simplified design equations for an optical quarter-wave stack reflection filter
[AD-A168442] N87-12340

NASA PROGRAMS
Strategy for safely returning space shuttle to flight status
[GPO-63-144] N87-11823
Investigation of the Challenger accident
[H-REPT-99-1016] N87-11824
Authorization of appropriations for the National Aeronautics and Space Administration for Fiscal Year 1987
[S-REPT-99-501] N87-12400
Making appropriations for the Department of Housing and Urban Development and for sundry independent agencies, boards, commissions, corporations and offices for the fiscal year ending September 30, 1987
[GPO-64-330] N87-12401

NASA SPACE PROGRAMS
Hearings before the Subcommittee on Space Science and Applications of the Committee on Science and Technology, 99th Congress, 2nd Session, No. 132, 25, 27 February; 11, 13, 20 March; 9, 10 April, 1983, Volume 2
[GPO-61-777] N87-12402

NASTRAN
Design enhancement tools in MSC/NASTRAN N87-11748

NATIONAL SEVERE STORMS PROJECT
National Severe Storms Laboratory, fiscal year 1985
[PB86-203841] N87-12096

NATURAL GAS
Integrated natural gas engine cooling jacket vapor compressor program, phase 1A
[PB86-215662] N87-12009

NATURAL SATELLITES
Extended atmospheres of outer planet satellites and comets
[NASA-CR-176888] N87-12519

NAVIER-STOKES EQUATION
Bifurcations in unsteady aerodynamics
[NASA-TM-88316] N87-11697
Numerical solution of the incompressible Navier-Stokes equations in three-dimensional generalized curvilinear coordinates
[NASA-TM-86840] N87-11964

NAVIGATION
State-space analysis of the Trident 2 mark 6 gyro
[AD-A168404] N87-11821

NAVIGATION INSTRUMENTS
Psychophysiological aspects of color-coding of flight and navigation information on onboard electronic displays N87-12127

NAVY
An application of multidimensional scaling to describe stress among naval helicopter pilots
[AD-A168367] N87-12162

NEAR INFRARED RADIATION
Observation with video equipment in the wavelength range 1.2 to 2.0 micrometer
[FOA-C-30417-E1] N87-12347

NEPTUNE (PLANET)
Interiors of the giant planets N87-12420
Ground-based studies of Jupiter, Uranus, and Neptune in support of the Galileo and Voyager missions N87-12434
Visible phase curves of Uranus and Neptune and scattering in their atmospheres N87-12436

NERVOUS SYSTEM
Stress and neuroendocrine regulation of immune responses
[AD-A168768] N87-12155
Optical computing based on the hopfield model for neural nets
[AD-A168767] N87-12268
Psychological concepts in a parallel system
[AD-A169615] N87-12390

NETWORK ANALYSIS
Generalized network implementations
[AD-A168298] N87-12266

NEURAL NETS
Optical computing based on the hopfield model for neural nets
[AD-A168767] N87-12268
Psychological concepts in a parallel system
[AD-A169615] N87-12390

NEURONS
Psychological concepts in a parallel system
[AD-A169615] N87-12390

NEUTRAL GASES
Galaxy groups: Neutral hydrogen and dynamics N87-12512

NEUTRINOS
Relevance at an intermediate-range force for neutron-antineutron oscillation experiments
[NOTA-INTERNA-864] N87-12330
High energy neutrino emission from binary X-ray sources
[PREPRINT-471] N87-12529

NEUTRON BEAMS
Relevance at an intermediate-range force for neutron-antineutron oscillation experiments
[NOTA-INTERNA-864] N87-12330

NEUTRON STARS
Topics in the theory of neutron star cooling N87-12515

NEUTRONS
Gamma rays and neutrons from solar flares N87-12526

NEWTON-RAPHSON METHOD
Aircraft automatic-flight-control system with inversion of the model in the feed-forward path using a Newton-Raphson technique for the inversion
[NASA-TM-88209] N87-11796

NICKEL
Primary arm spacing in chill block melt spun Ni-Mo alloys
[NASA-TM-88687] N87-11875

NICKEL ALLOYS
The elastic constants of Ni3Al to 1.4 GPa
[AD-A168813] N87-11879

NICKEL STEELS
Application of the key curve and multi-specimen techniques to dynamic J-R curve testing of alloy steel
[TI86-901252] N87-11887

NITROGEN OXIDES
Calculation of potential energy surfaces for HCO and HNO using many-body methods
[AD-A169611] N87-11883

NOISE MEASUREMENT
Introduction to helicopter noise
[ISL-NB-401/84] N87-12327

NOISE REDUCTION
HALOE science investigation
[NASA-CR-179825] N87-11857
Distribution system simulator
[NASA-CR-179918] N87-11940
Mathematical morphology applied to range image processing N87-12222
Lightweight sidewalls for aircraft interior noise control
[NASA-CR-172490] N87-12323
Two methods for calculating acoustic wave propagation through an interface — noise reduction
[ESA-TT-955] N87-12325
On sound propagation in centrifugal fan casings
[ESA-TT-957] N87-12326

NONDESTRUCTIVE TESTS
Ultrasonic imaging and automated flaw detection system
[AD-A168195] N87-12011

NONLINEAR EQUATIONS
Bifurcations in unsteady aerodynamics
[NASA-TM-88316] N87-11697
Analytic solutions of the nonlinear partial differential equations for transonic flow in physical spaces
[DFVLR-FB-86-14] N87-11705
On realization of nonlinear systems described by higher-order differential equations
[MEMO-569] N87-12297

NONLINEAR FILTERS
Research in adaptive and decentralized stochastic control
[AD-A168752] N87-12275

NONLINEAR PROGRAMMING
A note on nonlinear approaches to linear programming
[AD-A168698] N87-12253
Nonlinear approaches to linear programming
[DE86-010692] N87-12254

NONLINEAR SYSTEMS
Post and a random-walk search mode N87-11764
Analysis of some nonlinear problems. Models of plates and shells
[ETN-86-98404] N87-12026
Analysis and regulation of nonlinear and generalized linear systems
[AD-A168615] N87-12284
On realization of nonlinear systems described by higher-order differential equations
[MEMO-569] N87-12297

Computation of the invariant probability of a nonlinear stochastic system and applications to queueing systems
[ENST-85D007] N87-12311
NONLINEARITY
Fundamental differences between optimization code test problems in engineering applications N87-11772
NONPARAMETRIC STATISTICS
Monotonicity of rank statistics in some nonparametric testing problems
[REPT-292] N87-12314
NOREPINEPHRINE
Norepinephrine used to control energy of heat production and utilization of ATP in single muscular contraction under normal and hyperoxic conditions
N87-12141
NORMALIZING (STATISTICS)
The nonlinear sigma model: Three loops renormalization and lattice scaling
[PREPRINT-466] N87-12313
NORTH SEA
Evaluation of wave calculations using GONO in the period October 1984 - April 1985
[KNMI-TR-79] N87-12102
NOTCH STRENGTH
Mechanical properties of various alloys in hydrogen
[NASA-CR-179874] N87-11889
NOTCH TESTS
A wedge test for quantifying fully plastic fracture
[AD-A166607] N87-12023
NOVA LASER SYSTEM
Summary of control and data acquisition systems for Nova experiments
[DE86-010563] N87-11989
NUCLEAR MAGNETIC RESONANCE
In vivo nuclear magnetic resonance imaging
[NASA-CR-179902] N87-12328
NUCLEAR RESEARCH AND TEST REACTORS
SP-100 ground engineering system test at Hanford Potential Bidders' Site Tour, December 18, 1985
[DE86-009954] N87-12335
NUMERICAL ANALYSIS
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A169450] N87-11885
Drag and pressure recovery characteristics of auxiliary air inlets at subsonic speeds
[ESDU-86002] N87-11892
Role of optimization in interdisciplinary analyses of naval structures N87-11727
NUMERICAL INTEGRATION
Numerical methods for the solution of ordinary differential equations: Initial value problems
[ESDU-86011] N87-12290
NUTATION
The Earth's nutational motion determined from radio interferometry N87-12518
NUTRITIONAL REQUIREMENTS
Biological value of proteins in food allowance of Salyut orbital station crews N87-12135
NUTS (FASTENERS)
Applying, measuring and maintaining pretension in steel bolts
[ESDU-86014] N87-12015

O

OCEAN CURRENTS
Pacific Coast hindcast deepwater wave information
[AD-A169511] N87-12096
OCEAN DATA ACQUISITIONS SYSTEMS
Real time oceanographic analysis for the south western Australian area for July 1984 to August 1985
[AD-A169741] N87-12100
OCEAN MODELS
Inversion of ocean data
[AD-A168676] N87-12099
Evaluation of wave calculations using GONO in the period October 1984 - April 1985
[KNMI-TR-79] N87-12102
OCEAN SURFACE
Surface-search radar performance in the evaporation duct: Global predictions, Revision A
[AD-A169631] N87-11922
OCEANOGRAPHIC PARAMETERS
NOAA (National Oceanic and Atmospheric Administration) N-ROSS/ERS-1 Environmental Data Development (NNEEDD) products and services
[PB86-213527] N87-11836
Pacific Coast hindcast deepwater wave information
[AD-A169511] N87-12096
Real time oceanographic analysis for the south western Australian area for July 1984 to August 1985
[AD-A169741] N87-12100
OFFSHORE PLATFORMS
Structural optimization of large ocean-going structures
N87-11771
Systems, avionics and instrumentation of transport category helicopters
[NLR-MP-85066-U] N87-11795
ONBOARD EQUIPMENT
A small, flexible and powerful data acquisition system for the F16 aircraft
[NLR-MP-85074-U] N87-11796
OPERATIONS RESEARCH
A research planning assessment for applications of artificial intelligence in manufacturing
[AD-A169692] N87-12252
OPERATOR PERFORMANCE
Forecasting operator work capacity during long-term continuous work N87-12129
Register of research in progress on mental workload
[AD-A169210] N87-12180
OPERATORS (MATHEMATICS)
Stochastic integration for operator valued processes on Hilbert spaces and on nuclear spaces
[AD-A169601] N87-12315
OPTICAL COMMUNICATION
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A169450] N87-11885
Laser based information systems (selected pages)
[AD-A169418] N87-11988
OPTICAL COMPUTERS
Optical computing based on the hopfield model for neural nets
[AD-A168767] N87-12298
OPTICAL DATA PROCESSING
Optical computing based on the hopfield model for neural nets
[AD-A168767] N87-12298
OPTICAL DISKS
Using optical disk as the storage media device for the master personnel files
[AD-A168390] N87-12387
OPTICAL EQUIPMENT
Large optics technology
[AD-A169222] N87-12339
Phase-only optical filter for use in an optical correlation system
[AD-D012396] N87-12343
OPTICAL FILTERS
Simplified design equations for an optical quarter-wave stack reflection filter
[AD-A169442] N87-12340
OPTICAL MEASURING INSTRUMENTS
Power system applications of fiber optic sensors
[NASA-CR-179921] N87-12337
OPTICAL MEMORY (DATA STORAGE)
Using optical disk as the storage media device for the master personnel files
[AD-A168390] N87-12387
OPTICAL PATHS
Optics '86: Four Western European Countries Review Recent Achievements
[AD-A170262] N87-12344
OPTICAL PROPERTIES
Raman determination of molecular structure and physical properties of dielectric coatings
[DE86-011620] N87-11867
Visual-optical assessment of thresholds of object distortion due to lens defects in flat glass of vehicle cabins N87-12131
The representation of water N87-12209
Large optics technology
[AD-A169222] N87-12339
Optical investigation of Comet Halley N87-12457
OPTICAL RADAR
Remote sensing of Earth Terrain
[NASA-CR-177195] N87-12098
OPTICAL RANGE FINDERS
Laser based information systems (selected pages)
[AD-A169418] N87-11988
OPTICAL REFLECTION
Simplified design equations for an optical quarter-wave stack reflection filter
[AD-A169442] N87-12340
OPTICAL TRACKING
Continuous prediction of Spartan visibility from Orbiter over modeled free-flight mission
[NASA-TM-86242] N87-11825
OPTICAL WAVEGUIDES
Research on materials and components for opto-electronic signal processing
[AD-A168751] N87-12565
OPTIMAL CONTROL
State-space analysis of the Trident 2 mark 6 gyro
[AD-A169404] N87-11521
Qualitative results for distributed systems with discrete and stiffness with application to control
[AD-A169622] N87-11928
Analysis and regulation of nonlinear and generalized linear systems
[AD-A169615] N87-12284
OPTIMIZATION
Recent Experience in Multidisciplinary Analysis and Optimization, part 1
[NASA-CP-2327-PT-1] N87-11717
Structural synthesis: Precursor and catalyst
N87-11718
Optimization in the systems engineering process
N87-11719
Practical considerations in aeroelastic design
N87-11720
Flutter optimization in fighter aircraft design
N87-11721
Application of the generalized reduced gradient method to conceptual aircraft design N87-11722
Experiences performing conceptual design optimization of transport aircraft N87-11723
The role of optimization in structural model refinement
N87-11724
Optimization process in helicopter design N87-11725
Role of optimization in interdisciplinary analyses of naval structures N87-11727
Application of optimization techniques to vehicle design: A review N87-11728
Structural Optimization in automotive design
N87-11729
STAEBL: Structural tailoring of engine blades, phase 2
N87-11731
Optimization of cascade blade mistuning under flutter and forced response constraints N87-11732
Sizing-stiffened composite panels loaded in the postbuckling range N87-11733
Optimal redesign study of the harm wing N87-11734
A nonlinear programming method for system design with results that have been implemented N87-11735
Application of optimization techniques to the design of a flutter suppression control law for the DAST ARW-2
N87-11736
Influence of analysis and design models on minimum weight design N87-11739
Structural sensitivity analysis: Methods, applications, and needs N87-11741
Sensitivity analysis in computational aerodynamics
N87-11742
Aircraft configuration optimization including optimized flight profiles N87-11743
The ADS general-purpose optimization program
N87-11744
Multidisciplinary optimization applied to a transport aircraft N87-11746
Design enhancement tools in MSC/NASTRAN
N87-11748
Recent Experiences in Multidisciplinary Analysis and Optimization, part 2
[NASA-CP-2327-PT-2] N87-11750
Overview: Applications of numerical optimization methods to helicopter design problems N87-11751
Regression analysis as a design optimization tool
N87-11754
A rotor optimization using regression analysis
N87-11755
Optimization of helicopter rotor blade design for minimum vibration N87-11756
Application of numerical optimization to rotor aerodynamic design N87-11757
Aeroelastic-aerodynamic optimization of high speed helicopter-compound rotor N87-11758
The structural optimization of a spreader bar for twin lift helicopter operations N87-11759
Multiobjective optimization techniques for structural design N87-11760
Design optimization of the 34-meter DSN-NCP antennas N87-11763
Post and a random-walk search mode N87-11764
Dual structural-control optimization of large space structures N87-11766
Structural optimization with constraints on transients response N87-11767
Optimization applications in aircraft engine design and test N87-11768
On optimal design for the blade-root/hub interface in jet engines N87-11769
Problems in large-scale structural optimization
N87-11770
Structural optimization of large ocean-going structures
N87-11771
Fundamental differences between optimization code test problems in engineering applications N87-11772
Comments on gust response constrained optimization
N87-11774

Applying optimization software libraries to engineering problems N87-11775
On the utilization of engineering knowledge in design optimization N87-11777
Shape optimization including finite element grid adaptation N87-11779
Proposal for reaching an optimization of a solid combustion vehicle satellite launcher and its trajectory [INPE-3966-TDL/232] N87-11822
Carburizing steel for high temperature service [AD-A166327] N87-11877
Contribution to the study of nonconvex nondifferentiable optimization algorithms [ETN-86-98403] N87-12296

ORBIT CALCULATION
Fast optimal orbit estimation from GPS measurements [INPE-4016-NTE/263] N87-11817

ORBITAL ASSEMBLY
Design, construction and utilization of a space station assembled from 5-meter erectable struts [NASA-TM-88043] N87-11827

ORBITAL MANEUVERS
Computer simulation of on-orbit manned maneuvering unit operations [NASA-CR-179904] N87-12245

ORBITAL MECHANICS
Geostationary orbital estimation using a Kalman filter [UTIAS-242] N87-11816
Satellite tracking and observability [AD-A166394] N87-11818

ORBITAL POSITION ESTIMATION
Fast optimal orbit estimation from GPS measurements [INPE-4016-NTE/263] N87-11817

ORBITAL SPACE STATIONS
Commentary, diagram of MIR station N87-11810
Organics in water contamination analyser, phase 1 [NASA-CR-179901] N87-12060
The space station: Human factors and productivity [NASA-CR-179905] N87-12199

ORBITS
Non-Maxwellian free-energy generation in the magnetotail due to chaotic particle motion [AD-A168504] N87-12351

ORGANIC LIQUIDS
Measurement and prediction of liquid mixture thermal conductivity and viscosity [DE86-012506] N87-11977

ORGANIZATIONS
Structural Optimization in automotive design N87-11729
National Severe Storms Laboratory, fiscal year 1985 [PB86-203641] N87-12096

ORGANOMETALLIC COMPOUNDS
Reductive disproportionation of carbon dioxide by dianionic carbonylmetalates of the transition metals [AD-A166211] N87-11869
Synthesis and crystal and molecular structure of In(C5Me5)-An apparent octahedral cluster [AD-A168281] N87-12210

ORTHOGONAL FUNCTIONS
Methods for stochastic spectral synthesis N87-12202

ORTHOSTATIC TOLERANCE
Typological characteristics of central hemodynamics of monkeys in clinostatic and orthostatic positions N87-12116
Effect of coamide and folicobalamin on erythropoiesis under normal living conditions and during antiorthostatic hypokinesia N87-12136
Relationship between constitutional distinctions and functional characteristics of the cardiovascular system of healthy subjects and patients with hypertension in clinostatic and orthostatic position N87-12143
Orthostatic cardiac rhythm response in waking Macaca mulatta monkeys N87-12147

ORTHOTROPIC PLATES
The surface crack problem in an orthotropic plate under bending and tension [NASA-CR-179892] N87-12320

OSCILLATIONS
Effect of resistance on projectile oscillations in augmented rail guns [DE86-012424] N87-11819
Relationship between the southern oscillation El Nino and rainfall in South America, Africa, India, Australia and New Zealand [INPE-4005-PRE/996] N87-12039

OSTEOPOROSIS
Effect of hydrocortisone on osteogenic function of mouse bone marrow N87-12122
Effect of weightlessness on rat fetus skeletal development N87-12139

OUTER PLANETS EXPLORERS
Extended atmospheres of outer planet satellites and comets [NASA-CR-179888] N87-12519

OUTLET FLOW
Pressure and flow field measurements of axial turbine tip clearance flow in a linear cascade [CUED/A-TURBO-TR-123] N87-11791

OUTLIERS (STATISTICS)
Controlling outliers in contingent valuation experiments [PB86-210486] N87-12299

OXIDATION
Grain boundary oxidation and fatigue crack growth at elevated temperatures [NASA-CR-179889] N87-11873

OXYGEN
Multidisciplinary approach to the design of high pressure oxygen systems N87-11780
Lifetimes and quenching of the B state of PO by atmospheric gases [AD-A166736] N87-11860
Optical spectroscopic studies of Wolf-Rayet carbon and oxygen stars N87-12504

OXYGEN ATOMS
Simulation studies for surfaces and materials strength [NASA-CR-177048] N87-12357

OXYGEN BREATHING
Use of gas mixtures with high oxygen and carbon dioxide content to normalize external respiration and blood acid-base equilibrium in presence of muscle fatigue N87-12132

OZONE
A comparison of Stratospheric Aerosol and Gas Experiment 1 (SAGE 1) and Umkehr ozone profiles including a search for Umkehr aerosol effects N87-12066

OZONOMETRY
Standard reference photometer network for verification and certification of ozone standards [PB86-205486] N87-12064

P

P-I-N JUNCTIONS
Research on high-efficiency single-junction monolithic thin-film amorphous silicon solar cells [DE86-004458] N87-12051

PACIFIC OCEAN
Equatorial Pacific Ocean Climate Studies (EPOCS): Progress and plans [PB86-213493] N87-12092
Mariners Weather Log, volume 30, number 2, spring 1986 [PB86-213980] N87-12093
Pacific Coast hindcast deepwater wave information [AD-A168511] N87-12098

PACKET SWITCHING
GRIDNET: A highly survivable digital communications network, phase 1 [PB86-203015] N87-11936

PACKETS (COMMUNICATION)
A class of stable transmission algorithms for varying user models [AD-A166701] N87-11923

PAINTS
A fast algorithm for general raster rotation N87-12168
A cel-based model for paint systems N87-12189

PAIR PRODUCTION
Density of states due to pairing of impurities in semiconductor systems [INPE-4009-PRE/1001] N87-12358

PANEL METHOD (FLUID DYNAMICS)
Contribution to the analysis of high-lift airfoil aerodynamics [AD-A168401] N87-11703

PANELS
Stiffened composite panels loaded in the postbuckling range N87-11733

PARABOLIC REFLECTORS
Summary assessment of solar thermal parabolic dish technology for electrical power generation [NASA-CR-179880] N87-12049

PARALLEL PROCESSING (COMPUTERS)
WEST-3 wind turbine simulator development [NASA-CR-174983] N87-12046
The application of a sparse, distributed memory to the detection, identification and manipulation of physical objects [NASA-TM-88231] N87-12109
An adaptive subdivision by sliding boundary surfaces for fast ray tracing N87-12182
Detection of faults and software reliability analysis [NASA-CR-179888] N87-12241
A network architecture for data-driven systems [AD-A168784] N87-12267
Dynamic grid manipulation for PDEs (Partial Differential Equations) on hypercube parallel processors [AD-A168679] N87-12286

PARALLEL PROGRAMMING
Parallel scheduling of recursively defined arrays [NASA-CR-178195] N87-12247

PARAMECIA
Paramecium test for toxic substances in human blood during simulated weightlessness N87-12115

PARAMETER IDENTIFICATION
Optimal sampling rates for auto regressive models [AD-A168740] N87-12288

PARAMETERIZATION
Keyframe-based subactors N87-12208
Discretizations for multigrid methods [TUM-I8519] N87-12278
M-estimation for discrete data: Asymptotic distribution theory and implications [AD-A166532] N87-12283
An approach to a Markovian realization of two-parameter processes [ENST-86D001] N87-12312

PARSING ALGORITHMS
Tree grammars as a pattern matching mechanism for code generation [TUM-I8524] N87-12279

PARTIAL DIFFERENTIAL EQUATIONS
Analytic solutions of the nonlinear partial differential equations for transonic flow in physical spaces [DFVLR-FB-86-14] N87-11705
Dynamic grid manipulation for PDEs (Partial Differential Equations) on hypercube parallel processors [AD-A168679] N87-12286

PARTICLE ACCELERATION
Gamma rays and neutrons from solar flares N87-12528

PARTICLE BEAMS
Effect of hard particle impacts on the atomic oxygen survivability of reflector surfaces with transparent protective overcoats [NASA-TM-88874] N87-11838

PARTICLE MOTION
Non-Maxwellian free-energy generation in the magnetotail due to chaotic particle motion [AD-A168504] N87-12351

PARTICLE PRODUCTION
Strange dibaryons — pion-kaon interactions on deuterium [NOTA-INTERNA-865] N87-12331
High resolution spectral imagery of comets N87-12470
Spatially resolved quantitative spectroscopy of comets N87-12471

PARTICLE SIZE DISTRIBUTION
Size distribution of unburned aluminum particles in solid propellant rocket motor exhaust [DE86-013376] N87-11840
Research on an aerodynamic particle separator (the EPS) [UTIAS-316] N87-11983

PARTICULATES
Research on an aerodynamic particle separator (the EPS) [UTIAS-316] N87-11983

PASSENGER AIRCRAFT
Systems, avionics and instrumentation of transport category helicopters [NLR-MP-85066-U] N87-11785

PATHOGENS
Sanitary and microbiological aspects of closed environment occupied by people and animals N87-12121

PATHOLOGICAL EFFECTS
Radiofrequency radiation: Activities and issues [PB86-217155] N87-12157

PATTERN RECOGNITION
Image analysis, perception strategy and cognitive strategy — microscopy images of biological cells [ETN-86-98401] N87-12104
Interfacing image processing and computer graphics systems using an artificial visual system N87-12210
Image techniques for the identification of depressions and other obstacles in automated guidance of roving robots N87-12224
Selection and use of image features for segmentation of boundary images N87-12226
Speeded phase discrimination: Evidence for global to local processing N87-12228
Edge-only matching technique in robot vision N87-12232
Coupling visual and dynamic features to study handwritten signatures N87-12238
Contour line region segmentation N87-12240
Recognition of two-dimensional shapes [AD-A168403] N87-12250

PAVEMENTS
Advanced construction procedures: Confined bases for airport pavements [FAA/PM-86/9] N87-11799

Criteria for asphalt-rubber concrete in civil airport pavements: Mixture design
[DOT/FAA/PM-86/39] N87-11910
Use of fuzzy sets mathematics to assist pavement evaluation and management. Executive summary (revised March 18, 1986)
[PB86-214780] N87-12298

PAYLOADS
The structural optimization of a spreader bar for twin lift helicopter operations N87-11759

PCM TELEMETRY
Spectral content of a transmitted FM signal
[BAE-BT-15660] N87-11930

PEAT
An ecologic study of peat landforms in Canada and Alaska
[NASA-CR-179740] N87-12033

PERCEPTION
An application of multidimensional scaling to describe stress among naval helicopter pilots
[AD-A168367] N87-12162

PERCEPTUAL ERRORS
Performance regulation and error control in a test of perceptual speed
[DFVLR-FB-86-13] N87-12164

PERFORATED SHELLS
A thin cylinder problem
[AD-A168665] N87-12251

PERFORMANCE PREDICTION
Design of a takeoff performance monitoring system N87-11787

PERFORMANCE TESTS
Motion characteristics of the UTIAS flight research simulator motion-base
[UTIAS-TN-261] N87-11802
Effectiveness: N sub TU relationships for the design and performance evaluation of two-stream heat exchangers
[ESDU-86018] N87-11959
Performance and design of composite beams with web openings
[PB86-213106] N87-12027

PERIODIC VARIATIONS
Variability studies of 3C 371 — extragalactic radio source
[NASA-CR-179772] N87-12406

PERIPHERAL VISION
Development of vision tests for air-to-air target detection
[AD-A168309] N87-12161

PERMEABILITY
Influence of displacement damage on deuterium permeation in 316 stainless steel
[DE86-010463] N87-11881

PERMEATING
Effects of microwave radiation on the blood-brain barrier
[PB86-213220] N87-12158

PERSONAL COMPUTERS
An encoding scheme for presentation graphics with animation N87-12177
Interactive 3-D modeling with personal computers N87-12203
PRO/Mapper: a plotting program for the DEC PRO/300 personal computers utilizing the MAPPER graphics language
[DE86-012635] N87-12255

PERSONALITY TESTS
The value of global self ratings in differential diagnostics
[DFVLR-FB-86-20] N87-12165

PERSONNEL
National Severe Storms Laboratory, fiscal year 1985
[PB86-203841] N87-12096
An application of multidimensional scaling to describe stress among naval helicopter pilots
[AD-A168367] N87-12162

PERSONNEL MANAGEMENT
Biological rhythms and rotating shift work: Some considerations for air traffic controllers and managers
[AD-A168742] N87-12153

PERTURBATION
Sensitivity analysis in computational aerodynamics N87-11742
Approximate evaluation of reliability and availability via perturbation analysis
[AD-A168561] N87-12014

PERTURBATION THEORY
Geostationary orbital estimation using a Kalman filter
[UTIAS-242] N87-11816
Calculation of potential energy surfaces for HCO and HNO using many-body methods
[AD-A169611] N87-11863
The nonlinear sigma model: Three loops renormalization and lattice scaling
[PREPRINT-466] N87-12313

PERVEANCE
Thermionic Cathode Project
[AD-A168569] N87-11941

PETROGRAPHY
Geochemistry and origin of regional dolomites
[DE86-012789] N87-12077

PETROLOGY
Antarctic meteorite newsletter, volume 9, number 1
[NASA-TM-89230] N87-12508

PHASE CONJUGATION
Optical phase conjugation via four-wave mixing in barium titanate
[AD-A169906] N87-12341

PHASE SWITCHING INTERFEROMETERS
High annular resolution stellar interferometry
[AD-A168755] N87-12498

PHASE TRANSFORMATIONS
The discrete site sticky wall model
[AD-A169910] N87-12370

PHASED ARRAYS
Ultrasonic imaging and automated flaw detection system
[AD-A168195] N87-12011

PHILOSOPHY
Philosophical aspects of adaptation theory N87-12106

PHONONS
Surface vibrations and (2x1) superstructures on FCC(110) metal surfaces
[AD-A168788] N87-12367

PHOSPHORIC ACID FUEL CELLS
Structure and activity of Pt-Co alloys as oxygen reduction electrocatalysts
[DE86-012831] N87-11867

PHOSPHORUS
Lifetimes and quenching of the B state of PO by atmospheric gases
[AD-A168735] N87-11860

PHOTOCONDUCTORS
Engineering limits of photoconductive semiconductor switches in pulsed power applications
[DE86-012282] N87-11951
Zone leveling and solution growth of complex compound semiconductors in space
[NASA-CR-179684] N87-12356
Analysis of the liquid crystal light valve using Bi12SiO20 as the photoconductor
[LR49625] N87-12375

PHOTODIODES
Research on materials and components for opto-electronic signal processing
[AD-A168751] N87-12365

PHOTOELECTROCHEMICAL DEVICES
High-efficiency, thin-film, cadmium chalcogenide photoelectrochemical cell with in situ storage
[DE86-004451] N87-11945

PHOTOGEOLOGY
Nature and origin of mineral coatings on volcanic rocks of the Black Mountain, Stonewall Mountain and Kane Springs Wash volcanic centers, southern Nevada
[NASA-CR-179738] N87-12067

PHOTOGRAPHIC FILM
Phase-only optical filter for use in an optical correlation system
[AD-D012396] N87-12343

PHOTOINTERPRETATION
Image segmentation based on color and texture gradient N87-12217
Map/image congruency evaluation knowledge based system N87-12218

PHOTOIONIZATION
Numerical hydrodynamic models of planetary nebulae N87-12517

PHOTOLYSIS
Lifetimes and quenching of the B state of PO by atmospheric gases
[AD-A168735] N87-11860

PHOTOMETERS
Standard reference photometer network for verification and certification of ozone standards
[PB86-205465] N87-12064
Semiconductor superlattice photodetectors
[NASA-CR-179650] N87-12355

PHOTOVOLTAIC CELLS
Utility-interactive inverter using the dc current-source approach
[DE86-012135] N87-11952
Photovoltaic technology evaluation
[DE86-010467] N87-12053

PHYSICAL CHEMISTRY
Application of computer techniques in the prediction of inorganic compounds
[PB86-205762] N87-11870

PHYSICAL EXERCISE
Human exercise and heat exchange in thermal environments
[AD-A168746] N87-12154

PHYSICAL FITNESS
Relationship of field tests to laboratory tests of muscular strength and endurance, and maximal aerobic power
[AD-A168260] N87-12150
Human exercise and heat exchange in thermal environments
[AD-A168746] N87-12154

PHYSICAL OPTICS
Electromagnetic backscattering by corner reflectors
[NASA-CR-179809] N87-11914

PHYSIOLOGICAL EFFECTS
Interview on medical program of 237-day flight N87-11814
Human blood free amino acids at early stage of head-down tilt N87-12113
Blood serum enzyme activity in healthy man with simulation of effects of weightlessness N87-12114
Paramecium test for toxic substances in human blood during simulated weightlessness N87-12115
Distinctions of capillarization of white rat skeletal muscle during adaptation to high altitude of the Pamirs and Antarctica N87-12117
Effect of hydrocortisone on osteogenic function of mouse bone marrow N87-12122
Carbon dioxide increase and human health: Data and research requirements for determining consequences (including a bibliography for additional reading)
[DE86-012780] N87-12156
Radiofrequency radiation: Activities and issues
[PB86-217155] N87-12157
In vivo nuclear magnetic resonance imaging
[NASA-CR-179902] N87-12328

PHYSIOLOGICAL FACTORS
Specialized equipment for magnetic recording of physiological data for experiments aboard biosatellites N87-12144

PHYSIOLOGICAL RESPONSES
USSR report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, March - April 1986
[JPRS-USB-86-004] N87-12105
Mathematical models of fluid-electrolyte metabolism N87-12106
Preliminary results of medical investigations during 5-month spaceflight aboard Salyut-7-Soyuz-T orbital complex N87-12109
Professional work capacity and functional state of operator exposed to repeated optokinetic and antiorthostatic factors N87-12110
Relationship of field tests to laboratory tests of muscular strength and endurance, and maximal aerobic power
[AD-A168260] N87-12150
Stress and neuroendocrine regulation of immune responses
[AD-A168768] N87-12155

PHYSIOLOGICAL TESTS
Paramecium test for toxic substances in human blood during simulated weightlessness N87-12115

PIEZOELECTRIC CERAMICS
Electron tunneling microscopy
[AD-A168234] N87-12359

PILOT ERROR
Extended analysis of the structure of error scores in psychological aptitude tests
[ESA-TT-943] N87-12163

PILOT PERFORMANCE
Evaluation of a visual system in its support of simulated helicopter flight
[AD-A168829] N87-11783
A helicopter flight evaluation of kinesthetic-tactual displays
[AD-A168302] N87-12167

PIPES (TUBES)
Acceptance criteria for welds in ASTM A106 grade B steel pipe and plate
[NASA-TM-89052] N87-11674
Dugdale model for circumferential through-cracks in pipes loaded by bending
[AD-A170260] N87-12024

PITCHING MOMENTS
Normal force, pitching moment and side force of axisymmetric forebody-cylinder combinations for angles of attack up to 90 degrees and Mach numbers up to 1.2
[ESDU-86009] N87-11690

PITOT TUBES
Pitot-pressure measurements in flow fields behind a rectangular nozzle with exhaust jet for free-stream Mach numbers of 0.00, 0.60, and 1.20
[NASA-TM-88990] N87-11696

PITUITARY GLAND
Functional state of somatotropic cells of adenohypophysis in hypokinetic rats N87-12140

PLANET EPHEMERIDES
Cometary dynamics N87-12479
International Halley Watch: Discipline specialists for radio science N87-12493
International Halley Watch: Discipline specialists for astronomy N87-12497
PLANETARY ATMOSPHERES
Reports of planetary astronomy, 1985 [NASA-TM-89189] N87-12407
Planetary spectroscopy N87-12413
Portable high speed photometry systems for observing occultations N87-12416
High-resolution imaging of solar system objects N87-12417
Research in planetary astronomy and operation of the 2.2-meter telescope N87-12419
Studies of extended planetary atmospheres N87-12421
Planetary submillimeter spectroscopy N87-12424
Infrared spectroscopy of Jupiter and Saturn N87-12425
Outer planet studies N87-12426
Lunar and planetary studies N87-12429
Infrared observations of planetary atmospheres N87-12430
Spectroscopic observations of the planets N87-12431
Ground-based studies of Jupiter, Uranus, and Neptune in support of the Galileo and Voyager missions N87-12434
Planetary Fabry-Perot spectroscopy N87-12437
Visible phase curves of Uranus and Neptune and scattering in their atmospheres N87-12438
Radiative transfer in planetary atmospheres N87-12456
A research proposal on spectroscopy of gases and solids observed in the solar system N87-12489
PLANETARY COMPOSITION
Research in planetary astronomy N87-12410
Infrared spectroscopy of Jupiter and Saturn N87-12425
Outer planet studies N87-12426
Infrared observations of planetary atmospheres N87-12430
Spectroscopic observations of the planets N87-12431
Ground-based observations of the Jupiter plasma torus N87-12432
A continued program of planetary study at the University of Texas McDonald Observatory N87-12433
Ground-based studies of Jupiter, Uranus, and Neptune in support of the Galileo and Voyager missions N87-12434
Infrared spectral studies of asteroids N87-12441
Planetary astronomy N87-12448
Planet-crossing asteroids: Interrelationships within the solar system N87-12462
Radar investigation of asteroids N87-12467
PLANETARY CORES
Interiors of the giant planets N87-12420
PLANETARY EVOLUTION
A continued program of planetary study at the University of Texas McDonald Observatory N87-12433
Observations of comets and asteroids N87-12439
PLANETARY MAGNETIC FIELDS
Pioneer 10 and 11 (Jupiter and Saturn) magnetic field experiments [NASA-CR-179656] N87-12520
PLANETARY MAPPING
The Arecibo S-band radar program N87-12408
Long-term changes in reflectivity and larger scale motions in the atmospheres of Jupiter and Saturn N87-12412
PLANETARY NEBULAE
Astronomical observations with an infrared array camera N87-12500
Numerical hydrodynamic models of planetary nebulae N87-12517
PLANETARY ORBITS
Goldstone solar system radar N87-12409
High-resolution imaging of solar system objects N87-12417
PLANETARY RADIATION
Theoretical and observational planetary physics N87-12415
Modeling and investigative studies of Jovian low frequency emissions N87-12427
Submillimeter and millimeter observations of solar system objects N87-12428
Infrared observations of planetary atmospheres N87-12430
Ground-based observations of the Jupiter plasma torus N87-12432
Analysis of Jovian decametric data: Study of radio emission mechanisms N87-12436
Visible phase curves of Uranus and Neptune and scattering in their atmospheres N87-12438
Planetary spectroscopy N87-12450
PLANETARY RINGS
Portable high speed photometry systems for observing occultations N87-12416
Interiors of the giant planets N87-12420
Research in planetary astronomy at Palomar Observatory N87-12435
PLANETARY ROTATION
Goldstone solar system radar N87-12409
Observations of comets and asteroids N87-12439
PLANETARY STRUCTURE
Research in planetary astronomy N87-12410
Infrared spectroscopy of Jupiter and Saturn N87-12425
Outer planet studies N87-12426
Infrared observations of planetary atmospheres N87-12430
Spectroscopic observations of the planets N87-12431
A continued program of planetary study at the University of Texas McDonald Observatory N87-12433
PLANETARY SURFACES
Goldstone solar system radar N87-12409
Research in planetary astronomy N87-12410
Research in planetary astronomy and operation of the 2.2-meter telescope N87-12419
Infrared observations of outer planet satellites N87-12423
Research in planetary astronomy at Palomar Observatory N87-12435
Infrared spectral studies of asteroids N87-12441
Studies of asteroids and comets N87-12442
Radar investigation of asteroids N87-12467
PLANETARY TEMPERATURE
Submillimeter and millimeter observations of solar system objects N87-12428
PLANETARY WAVES
Theoretical and observational planetary physics N87-12415
PLANTS (BOTANY)
Spectral characteristics and the extent of paleosols of the Palouse formation [NASA-CR-179727] N87-12034
Fractals, computers and DNA N87-12214
PLASMA ACCELERATORS
Supersymmetry: Proceedings [DE86-007853] N87-12334
PLASMA CONDUCTIVITY
Ground-based observations of the Jupiter plasma torus N87-12432
PLASMA CONTROL
Radial Fokker-Planck model for plasmas confined by magnetic mirror fields [DE86-012225] N87-12353
PLASMA CURRENTS
Reduction of the general Spitzer-Haerm problem in plasma physics [INPE-3978-PRE/969] N87-12348
PLASMA DENSITY
An equatorial scintillation model [AD-A168723] N87-11924
Plasma waves associated with the first AMPTE magnetotail barium release [AD-A170277] N87-12075
Voyager microwave scintillation measurements of solar wind plasma parameters N87-12526
PLASMA DYNAMICS
Non-Maxwellian free-energy generation in the magnetotail due to chaotic particle motion [AD-A168504] N87-12351
PLASMA INTERACTIONS
Ground-based observation of Comet Halley N87-12468
PLASMA JETS
Jets, mass outflows and disks associated with young stellar objects N87-12486
PLASMA OSCILLATIONS
Plasma waves associated with the first AMPTE magnetotail barium release [AD-A170277] N87-12075
PLASMA PHYSICS
Materials science and engineering at the Oak Ridge National Laboratory. Abstracts [DE86-011477] N87-11842
Theoretical behavior of fully ionized multiple species magnetized plasmas under rotation [INPE-3915-RPE-510] N87-12349
PLASMA SPECTRA
Imaging studies of comets N87-12443
PLASMA TURBULENCE
Millimeter wave generation by relativistic electron beams [AD-A168624] N87-12352
PLASMA WAVES
Plasma waves associated with the first AMPTE magnetotail barium release [AD-A170277] N87-12075
PLASMA-ELECTROMAGNETIC INTERACTION
Millimeter wave generation by relativistic electron beams [AD-A168624] N87-12352
PLASMAS (PHYSICS)
Microwave emission and scattering from Earth surface and atmosphere [NASA-CR-177189] N87-12066
PLASTIC DEFORMATION
Studies of strain rate effects in the deformation of solids by means of stress pulses and ultrasonic methods [DE86-012206] N87-12025
PLASTIC PROPERTIES
A wedge test for quantifying fully plastic fracture [AD-A168607] N87-12023
PLASTICS
Design of heat exchange element for plastic film heat exchanger [DE86-011042] N87-11973
PLATE THEORY
Analysis of some nonlinear problems. Models of plates and shells [ETN-86-98404] N87-12026
PLATES (STRUCTURAL MEMBERS)
Acceptance criteria for welds in ASTM A106 grade B steel pipe and plate [NASA-TM-89052] N87-11874
Asymptotic solutions to compressible laminar boundary-layer solutions for dusty-gas flow over a semi-infinite flat plate [UTIAS-310] N87-11967
Observation of the initiation and progression of damage in compressively loaded composite plates containing a cutout [NASA-CR-179911] N87-12022
Analysis of some nonlinear problems. Models of plates and shells [ETN-86-98404] N87-12026
PLATES (TECTONICS)
Tectonic evaluation of the Nubian shield of Northeastern Sudan using thematic mapper imagery [NASA-CR-177045] N87-12070
PLATINUM ALLOYS
Structure and activity of Pt-Co alloys as oxygen reduction electrocatalysts [DE86-012631] N87-11867
PLUTO (PLANET)
A continued program of planetary study at the University of Texas McDonald Observatory N87-12433
Speckle interferometry applied to asteroids and other solar system objects N87-12449
Asteroid shapes and pole orientation from visual and infrared photometry N87-12474
PLY ORIENTATION
Vertical deflection characteristics of aircraft tyres [ESDU-86005] N87-11992
POISSON EQUATION
The FORTRAN Formula Manipulator (FFM) [REPT-293] N87-12284
Discretizations for multigrid methods [TUM-I8519] N87-12278
POLAR COORDINATES
Asteroid shapes and pole orientation from visual and infrared photometry N87-12474
POLAR METEOROLOGY
On the role of moist baroclinic instability in the development of polar lows and comma clouds [INPE-3971-PRE/994] N87-12067
POLARIMETRY
Remote sensing of Earth Terrain [NASA-CR-177185] N87-12036
International Halley Watch: Discipline specialists for photometry and polarimetry N87-12491
POLARIZATION (WAVES)
Solar flare X-ray polarimetry [NASA-CR-179699] N87-12523
POLICIES
Biennial science and technology report to the Congress, 1983-1984 [PB86-209632] N87-12403
Antarctic meteorite newsletter, volume 9, number 1 [NASA-TM-88230] N87-12508
POLLUTION TRANSPORT
Terrain classification for regional transport models [KNMI-TR-81(FM)] N87-12063
POLYAMIDE RESINS
Expandable epoxy application [AD-A168669] N87-11895
POLYCRYSTALS
Interfacial reactions between amorphous W-Si thin films and polycrystalline overlayers [DE86-008959] N87-12372

POLYGONS
A file organization scheme for polygon data
N87-12221
POLYIMIDE RESINS
Polyimides containing oxyethylene units. Part 4: Polymerization of dianhydrides containing ether linkages
[NASA-TM-89257] N87-11891
Molecular characteristics of thermoplastic polyimides as functions different cure cycles
[FOA-C-20603-F9] N87-11898
POLYIMIDES
Method for producing a thin polyimide film on a silicon substrate — integrated circuits
[BAE-BT-14610] N87-11899
POLYMERIC FILMS
Development/Applications of FT-IR ATR (Fourier Transform IR Attenuated Total Internal Reflection) and photoacoustic dichroism techniques for structural characterization of polymer surfaces
[AD-A168519] N87-11894
Design of heat exchange element for plastic film heat exchanger
[DE86-011042] N87-11973
POLYMERIZATION
Environmentally stable polymers and coatings for space application: CH-5, supplement 10
[NASA-CR-177181] N87-11890
Polyimides containing oxyethylene units. Part 4: Polymerization of dianhydrides containing ether linkages
[NASA-TM-89257] N87-11891
Expandable epoxy application
[AD-A168669] N87-11895
POLYNOMIALS
A strongly polynomial algorithm for minimum cost submodular flow problems
[PREPRINT-102] N87-12293
Near-optimal starting solution for polynomial approximation of a continuous function in the L sub 1 norm
[PB86-215183] N87-12300
Evaluation of L sub 1 codes using polynomial approximation problems
[PB86-215175] N87-12301
Relation between tau-functions as determinants and group orbits: Pluecker relations
[MEMO-568] N87-12318
POLYPROPYLENE
The effect of high pressure on electrical relaxation in PPO and electrical conductivity in PPO complexed with lithium salts
[AD-A168694] N87-11882
Development/Applications of FT-IR ATR (Fourier Transform IR Attenuated Total Internal Reflection) and photoacoustic dichroism techniques for structural characterization of polymer surfaces
[AD-A168519] N87-11894
PORTABLE EQUIPMENT
Audiomagnetotelluric (AMT) system
[DE86-011274] N87-11906
POSITION (LOCATION)
Fast optimal orbit estimation from GPS measurements
[INPE-4016-NTE/263] N87-11817
HF (High Frequency) absolute time of arrival sensing
[AD-A168275] N87-11917
POSITION SENSING
Kinematic and geometric modelling and animation of robots N87-12178
POSITIONING
Techniques to improve astronomic positioning in the field
[AD-A168347] N87-12042
VIRYA: A motion control editor for kinematic and dynamic animation N87-12197
Modeling and animating three-dimensinal articulate figures N87-12199
POTABLE WATER
Organics in water contamination analyzer, phase 1
[NASA-CR-179901] N87-12060
POTENTIAL ENERGY
Simulation studies for surfaces and materials strength
[NASA-CR-177046] N87-12357
POTENTIAL FLOW
Acta Aerodynamica Sinica (selected articles)
[AD-A168449] N87-11884
POTENTIAL GRADIENTS
An automatic crack measuring system using the direct-current potential-difference method
[ARL-STRUC-R-419] N87-11982
POWDER (PARTICLES)
High-purity, fine-particle boron nitride powder synthesis at -75 to 750C, report of investigations
[PB86-217940] N87-11900
Antarctic meteorite newsletter, volume 9, number 1
[NASA-TM-89230] N87-12508
POWDER METALLURGY
Improvement in ductility and fracture toughness of HIP'd and isothermally forged Ti-6Al-6V-2Sn powder with heat treatment
[AD-A168804] N87-11878
POWER LINES
Distribution system simulator
[NASA-CR-179918] N87-11940
POWER SPECTRA
Simulation of a stochastic process with a nonrational spectrum
[FOA-C-20614-E3] N87-12295
PREDICTION ANALYSIS TECHNIQUES
Recognition of two-dimensional shapes
[AD-A168403] N87-12250
On the use of ridge and Stein-type estimators in prediction
[AD-A168349] N87-12302
A computational study of the influence of molecular nitrogen and laser absorption on plasma channel formation created by laser resonance saturation of sodium vapor
[UTIAS-292] N87-12350
Solar flare X-ray polarimetry
[NASA-CR-179899] N87-12523
PREDICTIONS
Thermal barrier coating life prediction model development
[NASA-CR-179508] N87-11892
Pacific Coast hindcast deepwater wave information
[AD-A168511] N87-12098
PREFLIGHT OPERATIONS
Ground aircraft deicing technology review
[DOT/FAA/CT-85/21] N87-11707
PREPROCESSING
Speeded phase discrimination: Evidence for global to local processing N87-12228
PRESERVING
Effect of long-term storage on some parameters of fat ingredient of freeze-dried products N87-12118
PRESIDENTIAL REPORTS
Biennial science and technology report to the Congress, 1953-1954
[PB86-209632] N87-12403
PRESSURE DEPENDENCE
The elastic constants of NiSAI to 1.4 GPa
[AD-A168813] N87-11879
PRESSURE DISTRIBUTION
Acta Aerodynamica Sinica (selected articles)
[AD-A168449] N87-11884
Pressure and flow field measurements of axial turbine tip clearance flow in a linear cascade
[CUED/A-TURBO-TR-123] N87-11791
PRESSURE EFFECTS
Pitot and static errors in steady level flight
[ESDU-86006] N87-11891
PRESSURE GRADIENTS
Modification of a variational objective analysis model for new equations for pressure gradient and vertical velocity in the lower troposphere and for spatial resolution and accuracy of satellite data
[NASA-CR-4025] N87-12085
PRESSURE MEASUREMENT
Pilot-pressure measurements in flow fields behind a rectangular nozzle with exhaust jet for free-stream Mach numbers of 0.00, 0.60, and 1.20
[NASA-TM-88990] N87-11896
Pressure and flow field measurements of axial turbine tip clearance flow in a linear cascade
[CUED/A-TURBO-TR-123] N87-11791
PRESSURE RECOVERY
Drag and pressure recovery characteristics of auxiliary air inlets at subsonic speeds
[ESDU-86002] N87-11892
PRESSURE VESSELS
Expandable epoxy application
[AD-A168669] N87-11895
PRINTING
Optical character recognition of touching characters
N87-12239
PRIVACY
Public perspectives on government information technology: A review of survey research on privacy, civil liberties and the democratic process
[PB86-218419] N87-12399
PROBABILITY DISTRIBUTION FUNCTIONS
M-estimation for discrete data: Asymptotic distribution theory and implications
[AD-A168532] N87-12293
Methods for calculating the probability distribution of sums of independent random variables
[AD-A170465] N87-12309
PROBABILITY THEORY
Detection of faults and software reliability analysis
[NASA-CR-179835] N87-12241
Cumulative probability tables for testing consensus in ranking experiments
[AD-A168376] N87-12300
Methods for calculating the probability distribution of sums of independent random variables
[AD-A170465] N87-12309
Computation of the invariant probability of a nonlinear stochastic system and applications to queueing systems
[ENST-86D007] N87-12311
An approach to a Markovian realization of two-parameter processes
[ENST-86D001] N87-12312
Estimating bucket accesses: A practical approach — data base queries
[INF-85-18] N87-12394
PROBLEM SOLVING
Inversion of ocean data
[AD-A168678] N87-12099
Extended analysis of the structure of error scores in psychological aptitude tests
[ESA-TT-943] N87-12183
A method of learning rules from uncertain data applied to the computer vision problem N87-12233
Error estimates for differential-algebraic equations
[DE86-012492] N87-12291
Reduction of the general Spitzer-Haarm problem in plasma physics
[INPE-3878-PRE/989] N87-12348
PRODUCT DEVELOPMENT
Data link isolator
[DIGEL-82] N87-11903
PRODUCTION COSTS
A dynamic model for airframe cost estimation
[AD-A168642] N87-11887
PRODUCTION ENGINEERING
A dynamic model for airframe cost estimation
[AD-A168642] N87-11887
National Forum on the Future of Automated Materials Processing in US Industry: The Role of Sensors. Report of a workshop (1st) held at Santa Barbara, California on December 16-17, 1985
[PB86-212040] N87-11912
A research planning assessment for applications of artificial intelligence in manufacturing
[AD-A168692] N87-12252
PRODUCTIVITY
Interpreting forest and grassland biome productivity utilizing nested scales of image resolution and biogeographical analysis
[NASA-CR-179803] N87-12029
Interpreting forest and grassland biome productivity utilizing nested scales of image resolution and biogeographical analysis
[NASA-CR-179739] N87-12032
PROGRAM VERIFICATION (COMPUTERS)
What are visual programming, programming by example and program visualization? N87-12185
Instrumentation tools for program testing
[INPE-3983-TDL/235] N87-12249
Some basic type checkers in PROLOG
[INF-85-20] N87-12261
PROGRAMMING LANGUAGES
Experiences with using Prolog for geometry
N87-12179
What are visual programming, programming by example and program visualization? N87-12185
Learning graphics programming by direct communication N87-12204
PS: A nonprocedural language with data types and modules
[NASA-CR-178198] N87-12246
Attribute grammars in the applicative programming language TWENTEL
[INF-85-16] N87-12260
PROJECT PLANNING
NOAA (National Oceanic and Atmospheric Administration) N-ROSS/ERS-1 Environmental Data Development (NNEEDD) products and services
[PB86-213527] N87-11936
Strategic plan, 1985
[NASA-TM-89263] N87-12384
PROJECTILES
Effect of resistance on projectile oscillations in augmented rail guns
[DE86-012424] N87-11919
Finite element analysis of composite plate impacted by a projectile N87-11943
PROPAGATION VELOCITY
Voyager microwave scintillation measurements of solar wind plasma parameters N87-12526
PROPELLANT ADDITIVES
High performance liquid chromatography of propellants. Part 1: Analysis of M1, M6, and M10 propellants
[AD-A168206] N87-11903

Mass spectrometric investigation of the thermal decomposition of several propellant and explosive ingredients
[AD-A166611] N87-11905

PROPELLANT BINDERS
Studies on the dynamic mechanical properties of the composite modified double-base propellant
[AD-A166799] N87-11907

PROPELLANT CHEMISTRY
Mass spectrometric investigation of the thermal decomposition of several propellant and explosive ingredients
[AD-A166611] N87-11905

PROPELLANT DECOMPOSITION
Mass spectrometric investigation of the thermal decomposition of several propellant and explosive ingredients
[AD-A166611] N87-11905

PROPELLANT GRAINS
Electro-optical control of solid fuel rocket burn rate
[AD-D012397] N87-11839

PROPYLENE OXIDE
The effect of high pressure on electrical relaxation in PPO and electrical conductivity in PPO complexed with lithium salts
[AD-A166694] N87-11862

PROTECTION
Investigation of the Challenger accident
[H-REPT-89-1015] N87-11824

PROTECTIVE COATINGS
Investigation of coating performance and corrosion of compressor components in the TF30-P-3 engine of F111C aircraft
[AD-A166902] N87-11792
Effect of hard particle impacts on the atomic oxygen survivability of reflector surfaces with transparent protective overcoats
[NASA-TM-86674] N87-11838
Thermal barrier coating life prediction model development
[NASA-CR-179608] N87-11892

PROTEIN METABOLISM
Biological value of proteins in food allowance of Salyut orbital station crews N87-12135
Effect of cosmide and folicobalamin on erythropoiesis under normal living conditions and during antiorthostatic hypokinesia N87-12136

PROTOTYPES
The 8 m x 6 m low speed wind tunnel at the Chinese Aerodynamic Research and Development Center
[AD-A169448] N87-11803
HALOE science investigation
[NASA-CR-179625] N87-11857
Catalytic combustion component and system prototype development
[PB86-211360] N87-11869
Rapid prototyping facility for flight research in artificial-intelligence-based flight systems concepts
[NASA-TM-88288] N87-12273
Using optical disk as the storage media device for the master personnel files
[AD-A166390] N87-12367

PROVING
Fundamental differences between optimization code test problems in engineering applications N87-11772

PSYCHOLOGICAL TESTS
Extended analysis of the structure of error scores in psychological aptitude tests
[ESA-TT-943] N87-12163
Performance regulation and error control in a test of perceptual speed
[DFVLR-FB-86-13] N87-12164

PSYCHOLOGY
Psychological concepts in a parallel system
[AD-A169615] N87-12390

PSYCHOPHYSICS
Temporal tuning effects in the visually evoked response
[AD-A166219] N87-12149
Selection and use of image features for segmentation of boundary images N87-12226
Correspondence in apparent motion: Defining the heuristics N87-12229
Three processing characteristics of texture discrimination N87-12230

PSYCHOPHYSIOLOGY
Psychophysiological aspects of color-coding of flight and navigation information on onboard electronic displays N87-12127

PULSE CODE MODULATION
Pulse Code Modulation (PCM) encoder handbook for Aydin Vector MMP-600 series system
[NASA-RP-1171] N87-11916

PULSE COMMUNICATION
GRIDNET: A highly survivable digital communications network, phase 1
[PB86-209015] N87-11936

PULSE GENERATORS
Alternator-driven, magnetically switched modulator
[DE86-012189] N87-11949

PULSE POSITION MODULATION
Development of Traveling Wave Tube (TWT) transmitter amplifier for communication satellites 60 GHz/10 W
[BMFT-FB-W-85-030] N87-11953

PULSE RADAR
Hand off integrator apparatus for signal detection
[AD-D012391] N87-11926

PULSE REPETITION RATE
Calorimetric measurements of the equivalent series resistance of low-loss, high repetition rate pulse discharge capacitors
[DE86-011232] N87-11948

PULSES
Studies of strain rate effects in the deformation of solids by means of stress pulses and ultrasonic methods
[DE86-012206] N87-12025

PUMPS
Losses in fountain-effect pumps
[NASA-TM-88232] N87-11965

PUSHBROOM SENSOR MODES
Design study of a push-broom imager for the thermal infrared
[MATRA-094/PH/UB/137.85] N87-12346

PYROLYTIC MATERIALS
Mass spectrometric investigation of the thermal decomposition of several propellant and explosive ingredients
[AD-A166611] N87-11905

PYROTECHNICS
Hot-spot model for calculating the threshold for shock initiation of pyrotechnic mixtures
[DE86-011638] N87-11866
Numerical routines for predicting ignition in pyrotechnic devices
[DE86-013251] N87-11909

Q

QUADRATIC PROGRAMMING
Contribution to the study of nonconvex nondifferentiable optimization algorithms
[ETN-86-98403] N87-12296

QUALITY CONTROL
Telemetry standards
[AD-A169818] N87-11826
Behavior of an Inconel 718 container in the presence of hydrogen — spacecraft fuel tanks
[ESA-CR(P)-2262] N87-11883
Design of a data acquisition and recording system for a resistance welder
[DE86-012214] N87-12001

QUANTUM CHROMODYNAMICS
Topics in the theory of neutron star cooling N87-12515

QUANTUM ELECTRONICS
Deep-level transient spectroscopy studies of gallium arsenide - aluminum gallium arsenide heterostructures and superlattices
[AD-A168328] N87-12361
High speed compound semiconductor devices in layered structures
[AD-A166066] N87-12366

QUANTUM MECHANICS
Multichannel nonpotential scattering theory
[PREPRINT-476] N87-12333
Tunneling in one dimension: General theory, instabilities, rules of calculation, applications — quantum mechanics
[PREPRINT-475] N87-12374
Stochastic mechanics of a Dirac particle in two space-time dimensions
[PREPRINT-474] N87-12381

QUANTUM STATISTICS
Quantized vortex filaments in incompressible fluids
[DE86-011240] N87-11974
On the massive sine Gordon equation in all regions of collapse
[NOTA-INTERNA-856] N87-12378
Stochastic mechanics of a Dirac particle in two space-time dimensions
[PREPRINT-474] N87-12381

QUANTUM THEORY
Research on semiconductor heterostructures
[AD-A166357] N87-12363
On the massive sine Gordon equation in all regions of collapse
[NOTA-INTERNA-856] N87-12378

QUARKS
Strange dibaryons — pion-kaon interactions on deuterium
[NOTA-INTERNA-865] N87-12331
Topics in the theory of neutron star cooling N87-12515

QUEUEING THEORY
Research in adaptive and decentralized stochastic control
[AD-A168752] N87-12275
DFR (Decreasing Failure Rate) property of first passage times and its preservation under geometric compounding
[AD-A165671] N87-12304
Computation of the invariant probability of a nonlinear stochastic system and applications to queueing systems
[ENST-85D007] N87-12311

R

RADAR ASTRONOMY
The Arecibo S-band radar program N87-12406
Goldstone solar system radar N87-12409
High-resolution imaging of solar system objects N87-12417

RADAR BEACONS
Mode S beacon system: Functional description
[DOT/FAA/PM-86/19] N87-11715

RADAR CORNER REFLECTORS
Electromagnetic backscattering by corner reflectors
[NASA-CR-179646] N87-11913

RADAR CROSS SECTIONS
Electromagnetic backscattering by corner reflectors
[NASA-CR-179646] N87-11913

RADAR IMAGERY
The Arecibo S-band radar program N87-12406
High-resolution imaging of solar system objects N87-12417

RADAR MAPS
Infrared observations of planetary atmospheres N87-12430

RADAR MEASUREMENT
Data processing and case study analysis of thunderstorm studies
[NASA-CR-179660] N87-12069

RADAR RANGE
Surface-search radar performance in the evaporation duct: Global predictions, Revision A
[AD-A166631] N87-11922

RADAR TARGETS
Surface-search radar performance in the evaporation duct: Global predictions, Revision A
[AD-A166631] N87-11922
Hand off integrator apparatus for signal detection
[AD-D012391] N87-11926

RADAR TRACKING
Radar investigation of asteroids N87-12467
A search for Earth-approaching asteroids N87-12472

RADIAL FLOW
On sound propagation in centrifugal fan casings
[ESA-TT-957] N87-12326

RADIAL VELOCITY
Determination of stellar radial velocity precision attainable with a coude spectrograph N87-12453
The radial velocity search for extrasolar planets N87-12455

RADIANT FLUX DENSITY
Measurement of radiation intensity at the solar tower plant SSPS/CRS of the IEA in Spain
[ESA-TT-961] N87-12055

RADIATION DAMAGE
Influence of displacement damage on deuterium permeation in 316 stainless steel
[DE86-010463] N87-11861
High energy electron radiation degradation of gallium arsenide solar cells
[AD-A166402] N87-12050

RADIATION DOSAGE
Radio-frequency electromagnetic radiation: Radiation safety N87-12107

RADIATION EFFECTS
Nuclear hardening of optical coatings: Enhanced energy sharing concept, revision 1
[DE86-009726] N87-11831
Investigation of viability of quail embryos and chicks when eggs are exposed to gamma radiation and vibration as related to different terms of egg storage N87-12119

RADIATION HARDENING
Nuclear hardening of optical coatings: Enhanced energy sharing concept, revision 1
[DE86-009726] N87-11831
Multiple task oriented processor
[AD-D012392] N87-12170

RADIATION HAZARDS
Radio-frequency electromagnetic radiation: Radiation safety N87-12107

RADIATION TRANSPORT
Receiver/reactor concepts for thermochemical transport of solar energy
[DE86-010959] N87-12054
RADICALS
Lifetimes and quenching of the B state of PO by atmospheric gases
[AD-A168735] N87-11860
RADIO ASTRONOMY
International Halley Watch: Discipline specialists for radio science N87-12493
High annular resolution stellar interferometry
[AD-A168755] N87-12498
X-ray and radio images of four supernova remnants with three distinct X-ray signatures N87-12503
Galaxy groups: Neutral hydrogen and dynamics N87-12512
RADIO BEACONS
Computer program for frequency assignments to aeronautical and maritime beacons and coast stations in the band 283.5 to 1800 kHz
[FOA-C-60018-E2] N87-11928
RADIO BURSTS
Analysis of Jovian decametric data: Study of radio emission mechanisms N87-12436
Stellar observations with the Voyager EUV objective grating spectrograph N87-12484
RADIO COMMUNICATION
Computer program for frequency assignments to aeronautical and maritime beacons and coast stations in the band 283.5 to 1800 kHz
[FOA-C-60018-E2] N87-11928
RADIO EMISSION
X-ray and radio images of four supernova remnants with three distinct X-ray signatures N87-12503
RADIO FREQUENCIES
Rain effects on radio frequency propagation
[AD-A168342] N87-11920
Radiofrequency radiation: Activities and issues
[PB86-217155] N87-12157
RADIO FREQUENCY INTERFERENCE
An equatorial scintillation model
[AD-A168723] N87-11924
Control of radio frequency interference in high frequency switched mode power supplies — weapon systems
[BAE-BT-15600] N87-11929
RADIO INTERFEROMETERS
The Earth's nutational motion determined from radio interferometry N87-12516
RADIO STARS
Multiwavelength studies of Cygnus X-3 N87-12502
RADIO TRANSMISSION
EHF (Extremely High Frequency) telecommunications system engineering model
[PB86-214814] N87-11937
RADIO WAVES
Radio-frequency electromagnetic radiation: Radiation safety N87-12107
Radiofrequency radiation: Activities and issues
[PB86-217155] N87-12157
Radiative transfer in planetary atmospheres N87-12456
RADIOMETERS
Measurement of radiation intensity at the solar tower plant SSPS/CRS of the IEA in Spain
[ESA-TT-961] N87-12055
RADIOMETRIC CORRECTION
LANDSAT-D program. Volume 2: Ground segment
[NASA-CR-177174] N87-12030
RADIOSONDES
Mathematical and statistical analysis
[AD-A169277] N87-11830
Preliminary estimates of radiosonde thermistor errors
[NASA-TP-2637] N87-12066
RADOMES
Techniques for microwave dielectric measurements
[AD-A168300] N87-11919
RADON
Radon optical processing in radon space
[AD-A169612] N87-11943
RAILGUN ACCELERATORS
Effect of resistance on projectile oscillations in augmented rail guns
[DE86-012424] N87-11819
RAIN
Rain effects on radio frequency propagation
[AD-A168342] N87-11920
Relationship between the southern oscillation El Nino and rainfall in South America, Africa, India, Australia and New Zealand
[INPE-4005-PRE/998] N87-12039
RAIN FORESTS
A study of the radiation balance of the Amazon Forest
[INPE-3958-PRE/974] N87-12061
RAMAN SPECTRA
Interplanetary and interstellar dust N87-12488
RAMAN SPECTROSCOPY
Raman determination of molecular structure and physical properties of dielectric coatings
[DE86-011620] N87-11897
RANDOM NOISE
On nonGaussian signal detection and channel capacity
[AD-A170239] N87-11927
RANDOM PROCESSES
A measure of the randomness of signals and suggested applications
[AD-A168916] N87-11925
RANDOM VARIABLES
A central limit theorem for Markov paths and some properties of Gaussian random fields
[AD-A170258] N87-12307
Methods for calculating the probability distribution of sums of independent random variables
[AD-A170465] N87-12309
RANDOM WALK
Post and a random-walk search mode N87-11764
Computation of the invariant probability of a nonlinear stochastic system and applications to queueing systems
[ENST-85D007] N87-12311
RANGE (EXTREMES)
Rain effects on radio frequency propagation
[AD-A168342] N87-11920
RANGE AND RANGE RATE TRACKING
Fast optimal orbit estimation from GPS measurements
[INPE-4016-NTE/263] N87-11817
RANK TESTS
Monotonicity of rank statistics in some nonparametric testing problems
[REPT-292] N87-12314
RANKINE CYCLE
Free-piston Stirling engine development
[PB86-213980] N87-12010
RANKING
Cumulative probability tables for testing consensus in ranking experiments
[AD-A168376] N87-12303
RAPID QUENCHING (METALLURGY)
Primary arm spacing in chill block melt spun Ni-Mo alloys
[NASA-TM-88887] N87-11875
RATS
Functional state of somatotropic cells of adenohypophysis in hypokinetic rats N87-12140
RAY TRACING
PORTRAY: An image synthesis system N87-12181
An adaptive subdivision by sliding boundary surfaces for fast ray tracing N87-12182
Using caching and breadth-first search to speed up ray-tracing N87-12184
Modeling and investigative studies of Jovian low frequency emissions N87-12427
RAYLEIGH SCATTERING
Kinetic and spectroscopic studies of chemical intermediates at both high and low temperatures
[AD-A168758] N87-11861
RAYLEIGH WAVES
A numerical study of diffraction in reentrant geologic structure
[AD-A168562] N87-12072
REACTION KINETICS
Kinetic and spectroscopic studies of chemical intermediates at both high and low temperatures
[AD-A168758] N87-11861
Mass spectrometric investigation of the thermal decomposition of several propellant and explosive ingredients
[AD-A169611] N87-11905
REACTOR SAFETY
Performance demonstration tests for detection of intergranular stress corrosion cracking
[TI86-007894] N87-11888
REAL GASES
Analysis of compressible boundary layer with real gas effects N87-11689
REAL TIME OPERATION
Reliable welding of HSLA steels by square wave pulsing using an advanced sensing (EDAP) technique
[AD-A168762] N87-11997
Real time oceanographic analysis for the south western Australian area for July 1984 to August 1985
[AD-A168741] N87-12120
LUSTRE: A data flow language for real time
[ETN-86-99400] N87-12262
A network architecture for data-driven systems
[AD-A168764] N87-12267
Development of algorithms and hardware for structured-light vision
[AD-A168197] N87-12338
REATTACHED FLOW
Third-moment closure of turbulence for predictions of separating and reattaching shear flows: A study of Reynolds-stress closure model
[NASA-CR-177055] N87-11981
RECOMBINATION REACTIONS
Calculation of potential energy surfaces for HCO and HNO using many-body methods
[AD-A169611] N87-11863
RECONSTRUCTION
A computational theory of 3D shape reconstruction from image contours N87-12225
Reconstruction and display of the retina N87-12236
Reconstruction of two-dimensional signals from the Fourier transform magnitude
[AD-A168792] N87-12289
RECORDS
Using optical disk as the storage media device for the master personnel files
[AD-A168390] N87-12387
RECURSIVE FUNCTIONS
Complete symmetry in D2L systems and cellular automata
[INF-85-14] N87-12172
Connected component labeling using modified linear quadtrees N87-12211
Parallel scheduling of recursively defined arrays
[NASA-CR-178195] N87-12247
Extending a relational interface with recursion — expert systems; data base systems
[INF-86-10] N87-12396
RED SHIFT
A new cross-correlation method to derive shifts from stellar spectra
[REPT-85-38] N87-12499
REDUCED GRAVITY
Mathematical models of fluid-electrolyte metabolism N87-12108
REDUCTION (CHEMISTRY)
Reductive disproportionation of carbon dioxide by dianionic carbonylmetalates of the transition metals
[AD-A168211] N87-11859
Structure and activity of Pt-Co alloys as oxygen reduction electrocatalysts
[DE86-012831] N87-11867
REDUNDANCY
GRIDNET: A highly survivable digital communications network, phase 1
[PB86-203015] N87-11936
The implementation and use of Ada on distributed systems with high reliability requirements
[NASA-CR-179806] N87-12243
REENTRY SHIELDING
Effects of forced and free convections on structural temperatures of shuttle orbiter during reentry flight
[NASA-TM-86800] N87-11988
REFERENCE STARS
International Halley Watch: Discipline specialists for astronomy N87-12497
REFLECTANCE
Characterization and discrimination of selected vegetation canopies from field observations of bidirectional reflectances
[NASA-CR-179837] N87-12037
Applications of world projections N87-12193
REFLECTORS
Electromagnetic backscattering by corner reflectors
[NASA-CR-179809] N87-11914
REGENERATION (ENGINEERING)
High throughput continuous cryopump
[DE86-010623] N87-12000
REGRESSION ANALYSIS
A rotor optimization using regression analysis N87-11755
Radon optical processing in radon space
[AD-A169612] N87-11943
On the use of ridge and Stein-type estimators in prediction
[AD-A168349] N87-12302
REINFORCED PLATES
Finite element analysis of composite plate impacted by a projectile N87-11843
REINFORCING FIBERS
Expandable epoxy application
[AD-A168669] N87-11895
RELATIONSHIPS
Computing covers for embedded functional dependencies — data base management
[REPT-86-006] N87-12393
RELATIVISTIC ELECTRON BEAMS
Millimeter wave generation by relativistic electron beams
[AD-A168624] N87-12352

RELATIVISTIC PARTICLES
Soliton surfaces 7. Relativistic string in external field: General integral and particular solutions
[PREPRINT-467] N87-12379
RELATIVITY
The 1915 epistolary controversy between A. Einstein and T. Levi-Civita
[PREPRINT-472] N87-12380
RELAXATION METHOD (MATHEMATICS)
Application of program POISSON to axially-symmetric problems - magnetostatic and electrostatic - with use of a prolate spheroidal boundary
[DE86-012826] N87-12256
A study of relaxation labelling methods and their role in computer vision
[BAE-BT-14885] N87-12258
RELAXATION TIME
The effect of high pressure on electrical relaxation in PPO and electrical conductivity in PPO complexed with lithium salts
[AD-A168894] N87-11862
RELIABILITY
The value of global self ratings in differential diagnostics
[DFVLR-FB-86-20] N87-12165
Comparison of maximus/bounding and Bayes/Monte Carlo for fault tree uncertainty analysis
[DE86-011704] N87-12310
RELIABILITY ANALYSIS
Approximate evaluation of reliability and availability via perturbation analysis
[AD-A168561] N87-12014
RELIABILITY ENGINEERING
Studies of high reliability long-life Li/SO sub 2 cells
[DE86-010478] N87-11947
Reliable welding of HSLA steels by square wave pulsing using an advanced sensing (EDAP) technique
[AD-A168762] N87-11997
Detection of faults and software reliability analysis
[NASA-CR-179835] N87-12241
REMOTE CONTROL
Electroluminescent (EL) remotely-controlled landing zone marker light system
[AD-D012386] N87-11716
REMOTE HANDLING
Arctic communications techniques: Remote unattended power systems
[AD-A168289] N87-11918
REMOTE SENSING
USSR report: Space
[JPRS-USP-86-005] N87-11809
NOAA (National Oceanic and Atmospheric Administration) N-ROSS/ERS-1 Environmental Data Development (NNEEDD) products and services
[PB86-213527] N87-11836
Remote sensing of Earth Terrain
[NASA-CR-177185] N87-12038
The Brazilian satellite remote sensing
[INPE-4006-PRE/999] N87-12040
An annotated bibliography of the Atlantic Remote Sensing Land-Ocean Experiment (ARSLOE)
[AD-A168703] N87-12043
Development of data processing, interpretation and analysis system for remote sensing of trace atmospheric gas species
[NASA-CR-179882] N87-12059
Application of satellite data to the variational analysis of the three dimensional wind field
[NASA-CR-4022] N87-12064
Observation with video equipment in the wavelength range 1.2 to 2.0 micrometer
[FOA-C-30417-E1] N87-12347
Passive microwave remote sensing of the asteroids using the VLA: Continuation N87-12476
REMOTE SENSORS
Project CONDORS: Convective diffusion observed by remote sensors
[PB86-222221] N87-12079
REQUIREMENTS
Reconstruction of two-dimensional signals from the Fourier transform magnitude
[AD-A168792] N87-12289
RESEARCH
Register of research in progress on mental workload
[AD-A168210] N87-12160
RESEARCH AIRCRAFT
Flight test report of the NASA icing research airplane: Performance, stability, and control after flight through natural icing conditions
[NASA-CR-179515] N87-11797
RESEARCH AND DEVELOPMENT
Academic science/engineering: R and D funds, fiscal year 1984 (detailed statistical tables)
[PB86-216017] N87-12362
Army technology development. IBIS query. Software to support the Image Based Information System (IBIS) expansion for mapping, charting and geodesy
[AD-A169609] N87-12389
Authorization of appropriations for the National Aeronautics and Space Administration for Fiscal Year 1987
[S-REPT-99-501] N87-12400
National aeronautical R and D goals: Technology for America's future
[PB86-209772] N87-12405
Research and technology, 1986
[NASA-TM-89037] N87-12531
RESEARCH FACILITIES
User's manual for a TEACH computer program for the analysis of turbulent, swirling reacting flow in a research combustor
[NASA-CR-179547] N87-11858
Rapid prototyping facility for flight research in artificial-intelligence-based flight systems concepts
[NASA-TM-88268] N87-12273
Publications of the Jet Propulsion Laboratory, 1984
[NASA-CR-179870] N87-12366
Research and technology
[NASA-TM-88852] N87-12530
Research and technology, 1986
[NASA-TM-89037] N87-12531
RESEARCH MANAGEMENT
NOAA (National Oceanic and Atmospheric Administration) N-ROSS/ERS-1 Environmental Data Development (NNEEDD) products and services
[PB86-213527] N87-11836
Research on an aerodynamic particle separator (the EPS)
[UTIAS-316] N87-11983
Research in very high performance computing: Policy recommendation and research requirements statement
[PB86-209723] N87-12174
A research planning assessment for applications of artificial intelligence in manufacturing
[AD-A168692] N87-12252
RESIDUAL STRENGTH
Impact and residual fatigue behavior of ARALL and AS6/5245 composite materials
[NASA-TM-89013] N87-11848
RESONANT VIBRATION
Geometric structure, pseudo band gaps, and surface vibrational resonances on metal surfaces
[AD-A168291] N87-11876
RESOURCES MANAGEMENT
Integration of remotely sensed data and geographic information systems N87-12216
Federal government information technology: Management, security and congressional oversight
[PB86-205499] N87-12397
RESPIRATION
Use of gas mixtures with high oxygen and carbon dioxide content to normalize external respiration and blood acid-base equilibrium in presence of muscle fatigue N87-12132
RETINA
Reconstruction and display of the retina N87-12238
REVERSE OSMOSIS
Reclamation of water used for washing by means of reverse osmosis during long-term spaceflights N87-12120
REYNOLDS STRESS
Third-moment closure of turbulence for predictions of separating and reattaching shear flows: A study of Reynolds-stress closure model
[NASA-CR-177055] N87-11961
RHYTHM (BIOLOGY)
Philosophical aspects of adaptation theory N87-12106
ROBOTICS
Active control of robot manipulator compliance
[NASA-CR-177183] N87-11994
Modal analysis of robots
[WPB-0144] N87-12007
The space station: Human factors and productivity
[NASA-CR-179905] N87-12166
Graphics interface 1986: Proceedings
[ISSN-0713-5424] N87-12175
Graphics tools in Adagio, a robotics multitasking multiprocessor workstation N87-12191
Topics in artificial intelligence
[INF-85-9] N87-12277
Development of algorithms and hardware for structured-light vision
[AD-A168197] N87-12338
ROBOTS
Measurement on the servo-systems of the ASEA IRB6/2 robot and analysis of servomotors for robots
[WPB-0131] N87-12006
Modal analysis of robots
[WPB-0144] N87-12007
Kinematic and geometric modelling and animation of robots N87-12178
Incremental construction of 3-D models from a sequence of framed views: Matching partial objects N87-12223
Image techniques for the identification of depressions and other obstacles in automated guidance of roving robots N87-12224
Edge-only matching techniques in robot vision N87-12232
ROBUSTNESS (MATHEMATICS)
M-estimation for discrete data: Asymptotic distribution theory and implications
[AD-A168532] N87-12283
ROCKET ENGINE CASES
Expendable epoxy application
[AD-A168669] N87-11895
ROCKET EXHAUST
Size distribution of unburned aluminum particles in solid propellant rocket motor exhaust
[DE86-013376] N87-11840
ROCKS
Nature and origin of mineral coatings on volcanic rocks of the Black Mountain, Stonewall Mountain and Kane Springs Wash volcanic centers, southern Nevada
[NASA-CR-179738] N87-12067
ROLLER BEARINGS
Selection of rolling-element bearing steels for long-life application
[NASA-TM-88881] N87-11993
Technology development for small high speed, mainshaft roller bearings
[AD-A168694] N87-11996
ROTARY WING AIRCRAFT
Compound cycle engine program
[NASA-TM-88879] N87-11790
ROTARY WINGS
Application of modern structural optimization to vibration reduction in rotorcraft N87-11752
Helicopter rotor blade aerodynamic optimization by mathematical programming N87-11753
A rotor optimization using regression analysis N87-11755
Optimization of helicopter rotor blade design for minimum vibration N87-11756
Aeroelastic-aerodynamic optimization of high speed helicopter-compound rotor N87-11758
The prediction of transonic loading advancing helicopter rotors
[AD-A168217] N87-11781
ROTATING BODIES
Linear and rotational acceleration of a 3D rigid body
[MED-INFO-SHEET-715] N87-12319
ROTATING FLUIDS
Boundary layer and parabolic flows
[ESA-TT-918] N87-11979
ROTATING PLASMAS
Theoretical behavior of fully ionized multiple species magnetized plasmas under rotation
[INPE-3915-RPE-510] N87-12349
ROTATION
A fast algorithm for general raster rotation N87-12158
ROTOR AERODYNAMICS
The prediction of transonic loading advancing helicopter rotors
[AD-A168217] N87-11781
ROTOR BLADES (TURBOMACHINERY)
Some observations on the behavior of the Langley model rotor blade
[NASA-CR-179880] N87-11895
ROTORS
Optimization of cascade blade mistuning under flutter and forced response constraints N87-11732
Fabrication of cooled radial turbine rotor
[NASA-CR-179503] N87-11789
Eigenvalue assignment strategies in rotor systems
[NASA-CR-179906] N87-12282
ROUTES
Two-dimensional polygonal representation of maps for use with autonomous vehicle route planning
[AD-A170301] N87-12044
RUBBER
Criteria for asphalt-rubber concrete in civil airport pavements: Mixture design
[DOT/FAA/PM-86/39] N87-11910
RUNGE-KUTTA METHOD
Numerical methods for the solution of ordinary differential equations: Initial value problems
[ESDU-86011] N87-12280
RUNWAY CONDITIONS
Runway incursions at controlled airports in the United States
[PB86-917003] N87-11711
Number and duration of Runway Visual Range (RVR) runs for RVR-values lower than 225 m
[KNMI-TR-85(FM)] N87-11805

RUNWAYS
Advanced construction procedures: Confined bases for airport pavements
[FAA/PM-86/9] N87-11799
Vertical deflection characteristics of aircraft tyres
[ESDU-86006] N87-11992

S

S MATRIX THEORY
Multichannel nonpotential scattering theory
[PREPRINT-476] N87-12333
SAFETY
Multidisciplinary approach to the design of high pressure oxygen systems N87-11780
Radio-frequency electromagnetic radiation: Radiation safety N87-12107
SAFETY FACTORS
Modeling of explosions: Fragmentation
[INPE-4022-NTE/264] N87-11969
System safety procedure for nondevelopment item (NDI) acquisitions
[AD-A166353] N87-12012
SALYUT SPACE STATION
Interview on medical program of 237-day flight N87-11814
SANDS
Advanced construction procedures: Confined bases for airport pavements
[FAA/PM-86/9] N87-11799
SANITATION
Sanitary and microbiological aspects of closed environment occupied by people and animals N87-12121
SATELLITE ATMOSPHERES
Search for volatiles in the surface of icy satellites N87-12414
Studies of extended planetary atmospheres N87-12421
Spectroscopic observations of the planets N87-12431
Extended atmospheres of outer planet satellites and comets
[NASA-CR-176888] N87-12519
SATELLITE DESIGN
Nuclear hardening of optical coatings: Enhanced energy sharing concept, revision 1
[DE86-009726] N87-11831
SATELLITE DRAG
Analytical investigation of the dynamics of tethered constellations in Earth orbit, phase 2
[NASA-CR-178863] N87-11815
SATELLITE IMAGERY
METEOSAT raw image data encryption
[ESA-CR(P)-2234] N87-11932
Principle of visual color coding applied to satellite imagery N87-12220
SATELLITE OBSERVATION
The Brazilian satellite remote sensing
[INPE-4006-PRE/999] N87-12040
SATELLITE TRANSMISSION
Development of Traveling Wave Tube (TWT) transmitter amplifier for communication satellites 60 GHz/10 W
[BMFT-FB-W-85-030] N87-11953
SATELLITE-BORNE RADAR
Advanced SAR study — satellite-borne radar
[BLS-5345] N87-11931
SATELLITE-TO-SATELLITE TRACKING
Continuous prediction of Spartan visibility from Orbiter over modeled free-flight mission
[NASA-TM-86242] N87-11825
SATURATION (CHEMISTRY)
A study of laser induced ionization of alkali metal vapours based on saturation of the first resonance transition
[UTIS-299] N87-11987
SATURN (PLANET)
Infrared spectroscopy of Jupiter and Saturn N87-12425
Submillimeter and millimeter observations of solar system objects N87-12428
Pioneer 10 and 11 (Jupiter and Saturn) magnetic field experiments
[NASA-CR-179886] N87-12520
SATURN ATMOSPHERE
Long-term changes in reflectivity and larger scale motions in the atmospheres of Jupiter and Saturn N87-12412
SATURN RINGS
Lunar and planetary studies N87-12429
SATURN SATELLITES
Search for volatiles in the surface of icy satellites N87-12414

SCALING LAWS
The nonlinear sigma model: Three loops renormalization and lattice scaling
[PREPRINT-466] N87-12313
SCANNING
Electron tunneling microscopy
[AD-A166234] N87-12359
SCATTERING CROSS SECTIONS
Electromagnetic backscattering by corner reflectors
[NASA-CR-179846] N87-11913
Electromagnetic backscattering by corner reflectors
[NASA-CR-179909] N87-11914
SCHEDULES
Strategy for safely returning space shuttle to flight status
[GPO-63-144] N87-11823
SCHEDULING
Biological rhythms and rotating shift work: Some considerations for air traffic controllers and managers
[AD-A166742] N87-12153
SCHOTTKY DIODES
Density of states at mid gap in hydrogenated amorphous silicon
[DE86-011403] N87-12373
SCIENTISTS
Methodological approach to the 1984 new entrants survey
[PB86-212305] N87-12363
SCINTILLATION
An equatorial scintillation model
[AD-A166723] N87-11924
Voyager microwave scintillation measurements of solar wind plasma parameters N87-12526
SCOOPS
Drag and pressure recovery characteristics of auxiliary air inlets at subsonic speeds
[ESDU-86002] N87-11992
SEA SURFACE TEMPERATURE
Equatorial Pacific Ocean Climate Studies (EPOCS): Progress and plans
[PB86-213493] N87-12002
SEARCH RADAR
Surface-search radar performance in the evaporation duct: Global predictions, Revision A
[AD-A166831] N87-11922
SEATS
Crash dynamics program transport seat performance and cost benefit study
[DOT/FAA/CT-85/36] N87-11706
SEGMENTS
Research in expert interactive cartographic systems
[AD-A166337] N87-12041
Three processing characteristics of texture discrimination N87-12230
SEISMIC WAVES
A numerical study of diffraction in reentrant geologic structure
[AD-A166562] N87-12072
SELECTION
Selection of rolling-element bearing steels for long-life application
[NASA-TM-88881] N87-11993
SELECTION RULES (NUCLEAR PHYSICS)
Surface vibrations and (2x1) superstructures on FCC(110) metal surfaces
[AD-A166788] N87-12367
SELF TESTS
A second generation experiment in fault-tolerant software
[NASA-CR-179848] N87-12242
SEMANTICS
Logical treatment of knowledge semantic integrity and organization in data base management systems
[ETN-86-96306] N87-12395
SEMICIRCULAR CANALS
Mathematical model of cupuloendolymphatic system with different cupula and endolymph densities — semicircular canals N87-12123
SEMICONDUCTOR DEVICES
Engineering limits of photoconductive semiconductor switches in pulsed power applications
[DE86-012282] N87-11951
Optimization of p-CuInSe sub 2/n-CdZnS solar cells
[DE86-010700] N87-12052
SEMICONDUCTORS (MATERIALS)
Submicrometer resolution etching of integrated circuit materials with laser-generated atomic fluorine
[ATR-86(8947)-1] N87-11939
Research on high-efficiency single-junction monolithic thin-film amorphous silicon solar cells
[DE86-004463] N87-12051
Zone levelling and solution growth of complex compound semiconductors in space
[NASA-CR-179884] N87-12368

Density of states due to pairing of impurities in semiconductor systems
[INPE-4009-PRE/1001] N87-12369
Research on semiconductor heterostructures
[AD-A166357] N87-12360
Research on materials and components for opto-electronic signal processing
[AD-A166751] N87-12365
SENSITIVITY
Structural sensitivity analysis: Methods, applications, and needs N87-11741
Sensitivity analysis in computational aerodynamics N87-11742
Sensitivity analysis and approximation methods for general eigenvalue problems
[NASA-CR-179536] N87-12021
SEPARATED FLOW
Application of viscous-inviscid interaction methods to transonic turbulent flows
[NASA-CR-179900] N87-11700
A viscous/inviscid zonal method for the computation of 2 and 3-dimensional compressible fluid flows with separation N87-11999
Third-moment closure of turbulence for predictions of separating and reattaching shear flows: A study of Reynolds-stress closure model
[NASA-CR-177055] N87-11961
Research on an aerodynamic particle separator (the EPS)
[UTIAS-316] N87-11963
SEQUENCING
Multidisciplinary systems optimization by linear decomposition N87-11740
Determining displacement fields along contours from image sequences N87-12231
Sequential estimation of boundaries in texture images N87-12234
SEQUENTIAL CONTROL
Electroluminescent (EL) remotely-controlled landing zone marker light system
[AD-D012386] N87-11716
SERVICE LIFE
High-efficiency, thin-film, cadmium chalcogenide photoelectrochemical cell with in situ storage
[DE86-004451] N87-11946
Studies of high reliability long-life Li/SO sub 2 cells
[DE86-010478] N87-11947
SERVOAMPLIFIERS
Performance characteristics of a GEC servoamplifier and permanent magnet electric motor
[LR45720] N87-11964
SERVOCONTROL
Control of a servomechanism for an elastic beam
[REPT-065.1706/86-0] N87-11966
Measurement on the servo-systems of the ASEA IRB6/2 robot and analysis of servomotors for robots
[WPB-0131] N87-12006
SERVOMECHANISMS
Control of a servomechanism for an elastic beam
[REPT-065.1706/86-0] N87-11966
SERVOMOTORS
Measurement on the servo-systems of the ASEA IRB6/2 robot and analysis of servomotors for robots
[WPB-0131] N87-12006
SET THEORY
On the elementary theorems of decision theory
[AD-A170285] N87-12385
Estimating bucket accesses: A practical approach — data base queries
[INF-86-18] N87-12394
SETTLING
Detection, identification, and settling of bacteria from an aerosol; testing of a detector for aerosols with bacteria and preliminary investigation of settling on different surface materials
[FOA-C-40229-B2] N87-12103
SEYFERT GALAXIES
Astronomical observations with an infrared array camera N87-12500
Non-thermal radiation mechanisms and processes in SS 433 and active galactic nuclei N87-12511
SHAFTS (MACHINE ELEMENTS)
Technology development for small high speed, mainshaft roller bearings
[AD-A166694] N87-11990
SHAPES
Shape optimization including finite element grid adaptation N87-11779
Constraint-based modeling of three-dimensional shapes N87-12200
The stochastic modelling of trees N87-12201
Interactive 3-D modeling with personal computers N87-12203
Mathematical morphology applied to range image processing N87-12222

A computational theory of 3D shape reconstruction from image contours N87-12225

SHEAR FLOW
Third-moment closure of turbulence for predictions of separating and reattaching shear flows: A study of Reynolds-stress closure model
[NASA-CR-177065] N87-11861

SHEAR STRESS
Calibration of surface hot-film sensors in dilute polymer flows
[AD-A166801] N87-11972

SHEARING
A fast algorithm for general raster rotation N87-12186

SHELL THEORY
Analysis of some nonlinear problems. Models of plates and shells
[ETN-86-99404] N87-12026

SHELLS (STRUCTURAL FORMS)
Effectiveness: N sub TU relationships for the design and performance evaluation of two-stream heat exchangers
[ESDU-86018] N87-11959
Enhancements to the STAGS computer code
[NASA-CR-4000] N87-12019
Analysis of some nonlinear problems. Models of plates and shells
[ETN-86-99404] N87-12026

SHIVERING
Human exercise and heat exchange in thermal environments
[AD-A168748] N87-12154

SHOCK TUBES
Acta Aerodynamica Sinica (selected articles)
[AD-A166440] N87-11884

SHOCK WAVE PROFILES
Fundamental study of dense-fluid detonation
[AD-A169753] N87-11906

SHOCK WAVES
Hot-spot model for calculating the threshold for shock initiation of pyrotechnic mixtures
[DE86-011636] N87-11866
Improvement of mechanical model in the entrainment method for compressible turbulent boundary layer
[AD-A166451] N87-11970
Magnetohydrodynamic shocks in molecular clouds N87-12354

SHORT TAKEOFF AIRCRAFT
The 5 m x 6 m low speed wind tunnel at the Chinese Aerodynamic Research and Development Center
[AD-A166448] N87-11803

SIGNAL ANALYSIS
A complex extension of the Hadamard transform for correlation purposes — scene correlation with matched filters
[BAE-ST-14469] N87-12292

SIGNAL DETECTION
HF (High Frequency) absolute time of arrival sensing
[AD-A166275] N87-11917
Hand off integrator apparatus for signal detection
[AD-D012391] N87-11926
On nonGaussian signal detection and channel capacity
[AD-A170239] N87-11027
Reconstruction of two-dimensional signals from the Fourier transform magnitude
[AD-A168792] N87-12289

SIGNAL MEASUREMENT
HF (High Frequency) absolute time of arrival sensing
[AD-A166275] N87-11917

SIGNAL PROCESSING
A measure of the randomness of signals and suggested applications
[AD-A168916] N87-11925
Hand off integrator apparatus for signal detection
[AD-D012391] N87-11926
Radon optical processing in radon space
[AD-A169612] N87-11943
Optical computing based on the hopfield model for neural nets
[AD-A168767] N87-12288
Reconstruction of two-dimensional signals from the Fourier transform magnitude
[AD-A168792] N87-12289
Research on materials and components for opto-electronic signal processing
[AD-A168751] N87-12365

SIGNAL TO NOISE RATIOS
A measure of the randomness of signals and suggested applications
[AD-A168916] N87-11925

SIGNATURES
Coupling visual and dynamic features to study handwritten signatures N87-12236

SIKORSKY AIRCRAFT
Systems, avionics and instrumentation of transport category helicopters
[NLR-MP-85066-U] N87-11785

SILICA GLASS
Surface chemistry and structural effects in the stress corrosion of glass and ceramic materials
[AD-A170243] N87-11896

SILICON
Method for producing a thin polyimide film on a silicon substrate — integrated circuits
[BAE-ST-14610] N87-11990
Research on high-efficiency single-junction monolithic thin-film amorphous silicon solar cells
[DE86-004453] N87-12051
Density of states at mid gap in hydrogenated amorphous silicon
[DE86-011403] N87-12373

SILICON CARBIDES
Modeling of infiltration kinetics and interfacial bond strength in aluminum matrix-silicon carbide composites
[AD-A170480] N87-11853

SILICON FILMS
Simulation studies for surfaces and materials strength
[NASA-CR-177046] N87-12357

SILOXANES
Environmentally stable polymers and coatings for space application: CH-5, supplement 10
[NASA-CR-177161] N87-11890

SILVER
Effect of hard particle impacts on the atomic oxygen survivability of reflector surfaces with transparent protective overcoats
[NASA-TM-86674] N87-11838

SIMPLEX METHOD
A note on nonlinear approaches to linear programming
[AD-A168698] N87-12253

SIMULATION
Monte Carlo simulation of free jet flow from a slit, revision 1
[DE86-011677] N87-11975
Simulation of a stochastic process with a nonrational spectrum
[FOA-C-20614-E3] N87-12296

SINGLE CRYSTALS
Zone leveling and solution growth of complex compound semiconductors in space
[NASA-CR-179884] N87-12356

SITES
SP-100 ground engineering system test at Hanford Potential Bidders' Site Tour, December 18, 1985
[DE86-009864] N87-12335
The discrete site sticky wall model
[AD-A169910] N87-12370

SIZE (DIMENSIONS)
Matching extension in bipartite graphs. 1. Introduction and terminology
[AD-A168606] N87-12265

SKIN FRICTION
Maximum lift/drag ratio of flat plates with bluntness and skin friction at hypersonic speeds
[NASA-TM-88339] N87-11898
Calibration of surface hot-film sensors in dilute polymer flows
[AD-A166801] N87-11972

SKIN TEMPERATURE (BIOLOGY)
Slowly-developing modifications in cutaneous circulatory control
[AD-A168702] N87-12152

SKY
Techniques to improve astronomic positioning in the field
[AD-A169347] N87-12042

SKY WAVES
HF (High Frequency) absolute time of arrival sensing
[AD-A166275] N87-11917

SLENDER BODIES
Vortex shedding of a square cylinder in front of a slender airfoil at high Reynolds numbers. Part 2: Compressibility effect
[MPIS-24/1986] N87-11704

SLENDER WINGS
Applications of CONMIN to wing design optimization with vortex flow effect N87-11797
Some experiences in aircraft aeroelastic design using Preliminary Aeroelastic Design of Structures (PAD) N87-11747

SLITS
Monte Carlo simulation of free jet flow from a slit, revision 1
[DE86-011677] N87-11975

SMOG
Study using a three-dimensional smog formation model under conditions of complex flow
[PB86-213246] N87-12080

SOCIOLOGY
A user's guide to the socioeconomic environmental demographic information system (SEEDIS)
[AD-A169917] N87-12369

SODIUM
Research on materials related to the sodium heat engine
[DE86-012833] N87-12004

SOFTWARE ENGINEERING
Design and experience with a generalized raster toolkit N87-12190
Exploiting classes in modeling and display software N87-12192
Detection of faults and software reliability analysis
[NASA-CR-179835] N87-12241
A second generation experiment in fault-tolerant software
[NASA-CR-179846] N87-12242
A research planning assessment for applications of artificial intelligence in manufacturing
[AD-A169892] N87-12252

SOFTWARE TOOLS
Design and experience with a generalized raster toolkit N87-12190
Coupling visual and dynamic features to study handwritten signatures N87-12236
Managing software complexity
[ERL-0372-RE] N87-12248
Instrumentation tools for program testing
[INPE-3983-TDL/236] N87-12249

SOIL MAPPING
Basalt depths in lunar basins using impact craters as stratigraphic probes: Evaluation of a method using orbital geochemical data
[NASA-CR-179858] N87-12521

SOILS
Spectral characteristics and the extent of paleosols of the Palouse formation
[NASA-CR-179727] N87-12034

SOLAR ACTIVITY
Simultaneous Solar Maximum Mission (SMM) and very large array observations of solar active regions
[NASA-CR-177187] N87-12522
Large-scale structure and dynamics of solar active regions observed in the far ultraviolet N87-12527

SOLAR CELLS
Results of the 1986 NASA/JPL Balloon Flight Solar Calibration Program
[NASA-CR-179916] N87-12046
High energy electron radiation degradation of gallium arsenide solar cells
[AD-A168402] N87-12050
Research on high-efficiency single-junction monolithic thin-film amorphous silicon solar cells
[DE86-004453] N87-12051
Optimization of p-CuInSe sub 2/n-CdZnS solar cells
[DE86-010700] N87-12052

SOLAR COLLECTORS
Summary assessment of solar thermal parabolic dish technology for electrical power generation
[NASA-CR-179920] N87-12049

SOLAR CONSTANT
Measurement of radiation intensity at the solar tower plant SSPS/CRS of the IEA in Spain
[ESA-TT-961] N87-12055

SOLAR CORPUSCULAR RADIATION
Voyager microwave scintillation measurements of solar wind plasma parameters N87-12526

SOLAR DYNAMIC POWER SYSTEMS
Effect of hard particle impacts on the atomic oxygen survivability of reflector surfaces with transparent protective overcoats
[NASA-TM-86674] N87-11838

SOLAR ENERGY ABSORBERS
Measurement of radiation intensity at the solar tower plant SSPS/CRS of the IEA in Spain
[ESA-TT-961] N87-12055

SOLAR ENERGY CONVERSION
Receiver/reactor concepts for thermochemical transport of solar energy
[DE86-010959] N87-12054

SOLAR FLARES
Solar flare X-ray polarimetry
[NASA-CR-179899] N87-12523
Gamma rays and neutrons from solar flares N87-12528

SOLAR MAXIMUM MISSION
Simultaneous Solar Maximum Mission (SMM) and very large array observations of solar active regions
[NASA-CR-177187] N87-12522

SOLAR PLANETARY INTERACTIONS
Ground-based observation of Comet Halley N87-12468

SOLAR RADIATION
A study of the radiation balance of the Amazon Forest
[INPE-3956-PRE/974] N87-12061

Spectral distribution and variation of solar radiation
[DE86-012146] N87-12076

SOLAR RADIO BURSTS
Low level decimetric (1.6 GHz) solar burst activity
[INPE-4004-PRE/997] N87-12524
Relative timings of MM-waves and associated M-waves solar bursts
[INPE-4013-PRE/1004] N87-12525

SOLAR RADIO EMISSION
Low level decimetric (1.6 GHz) solar burst activity
[INPE-4004-PRE/997] N87-12524
Relative timings of MM-waves and associated M-waves solar bursts
[INPE-4013-PRE/1004] N87-12525

SOLAR TERRESTRIAL INTERACTIONS
Conceptual design of a synoptic interplanetary monitor platform at L sub 1 (SIMPL)
[AD-A166522] N87-11828

SOLAR THERMAL ELECTRIC POWER PLANTS
Summary assessment of solar thermal parabolic dish technology for electrical power generation
[NASA-CR-179820] N87-12049

SOLAR WIND
Voyager microwave scintillation measurements of solar wind plasma parameters N87-12526

SOLID ELECTROLYTES
Research on materials related to the sodium heat engine
[DE86-012633] N87-12004

SOLID PHASES
The discrete site sticky wall model
[AD-A166910] N87-12370

SOLID PROPELLANT COMBUSTION
Size distribution of unburned aluminum particles in solid propellant rocket motor exhaust
[DE86-013376] N87-11940

SOLID PROPELLANT ROCKET ENGINES
Proposal for reaching an optimization of a solid combustion vehicle satellite launcher and its trajectory
[INPE-3966-TDL/232] N87-11822
Electro-optical control of solid fuel rocket burn rate
[AD-D012397] N87-11839

SOLID PROPELLANTS
High performance liquid chromatography of propellants. Part 1: Analysis of M1, M6, and M10 propellants
[AD-A166206] N87-11903

SOLID ROCKET PROPELLANTS
Electro-optical control of solid fuel rocket burn rate
[AD-D012397] N87-11839
Studies on the dynamic mechanical properties of the composite modified double-base propellant
[AD-A166799] N87-11907

SOLID STATE
A solid state data recorder for space-based applications using magnetic bubble memory
[AD-A166906] N87-11984

SOLID-SOLID INTERFACES
Modeling of infiltration kinetics and interfacial bond strength in aluminum matrix-silicon carbide composites
[AD-A170460] N87-11853

SOLIDIFICATION
Primary arm spacing in chill block melt spun Ni-Mo alloys
[NASA-TM-88867] N87-11875

SOLIDS
Studies of strain rate effects in the deformation of solids by means of stress pulses and ultrasonic methods
[DE86-012208] N87-12025
PORTRAY: An image synthesis system N87-12181
SMP: A solid modeling program version 2.0
[NASA-CR-178163] N87-12244

SOLITARY WAVES
Solutions in straits of varying width and depth
[PREPRINT-465] N87-12101
Soliton surfaces 7. Relativistic string in external field: General integral and particular solutions
[PREPRINT-467] N87-12379

SOUND PROPAGATION
On sound propagation in centrifugal fan casings
[ESA-TT-957] N87-12326

SOUND WAVES
Numerical study of the damping of acoustic waves in a duct with splitter plates
[MPIS-20/1985] N87-12324
Two methods for calculating acoustic wave propagation through an interface — noise reduction
[ESA-TT-955] N87-12325

SOUNDING
HF (High Frequency) absolute time of arrival sensing
[AD-A166275] N87-11917

SOUTHERN HEMISPHERE
Relationship between the southern oscillation El Nino and rainfall in South America, Africa, India, Australia and New Zealand
[INPE-4005-PRE/998] N87-12039

SPACE ADAPTATION SYNDROME
Professional work capacity and functional state of operator exposed to repeated optokinetic and antiorthostatic factors N87-12110
Mathematical model of cupuloendolymphatic system with different cupula and endolymph densities — semicircular canal N87-12123

SPACE ERECTABLE STRUCTURES
Design, construction and utilization of a space station assembled from 5-meter erectable struts
[NASA-TM-89043] N87-11827

SPACE EXPLORATION
USSR report: Space
[JPRS-USP-86-005] N87-11809
Commentary, diagram of MIR station N87-11810
Theoretical and observational planetary physics N87-12415
Research in planetary astronomy at Palomar Observatory N87-12435
Workshop on Earth-Orbital Planetary Astronomy N87-12480
A survey of nearby stars for the perturbative effects of extrasolar planetary systems N87-12482
The radial velocity search for extrasolar planets N87-12485

SPACE FLIGHT
Space activities of western Europe
[AD-A168424] N87-11807
Authorization of appropriations for the National Aeronautics and Space Administration for Fiscal Year 1987
[S-REPT-99-501] N87-12400

SPACE FLIGHT FEEDING
Human blood free amino acids at early stage of head-down tilt N87-12113
Biological value of proteins in food allowance of Salyut orbital station crews N87-12135

SPACE FLIGHT STRESS
Tolerance to +Gz accelerations of individuals of different ages other than pilots N87-12130
Behavioral reactions of animals exposed to spaceflight conditions in the prenatal period N87-12136
Endocrine status of cosmonauts following long-term space missions N87-12146
Problems of aviation and space medicine, biology and psychology discussed at fifteenth Gagarin Scientific Lectures N87-12148

SPACE FLIGHT TRAINING
Star City: On the 25th anniversary of the cosmonaut training center N87-11811

SPACE HEATING (BUILDINGS)
Advanced heat-pipe heat exchanger and microprocessor-based modulating burner controls development
[PB86-203239] N87-11981

SPACE OBSERVATIONS (FROM EARTH)
Workshop on Earth-Orbital Planetary Astronomy N87-12480
The International Halley Watch N87-12490
Astronomical observations with an infrared array camera N87-12500
The observation and analysis of lunar occultations of stars with an emphasis on improvements to data acquisition instrumentation and reduction techniques N87-12501
Astrometric observations of comets and asteroids and subsequent orbital investigations
[NASA-CR-179659] N87-12509
Galaxy groups: Neutral hydrogen and dynamics N87-12512

SPACE PERCEPTION
Visual-optical assessment of thresholds of object distortion due to lens defects in flat glass of vehicle cabins N87-12131
High annular resolution stellar interferometry
[AD-A168755] N87-12498

SPACE PLASMAS
Voyager microwave scintillation measurements of solar wind plasma parameters N87-12526

SPACE POWER REACTORS
SP-100 ground engineering system test at Hanford Potential Bidders' Site Tour, December 18, 1985
[DE86-009964] N87-12335

SPACE PROCESSING
Zone levelling and solution growth of complex compound semiconductors in space
[NASA-CR-179864] N87-12356

SPACE RATIONS
Effect of long-term storage on some parameters of fat ingredient of freeze-dried products N87-12118
Investigation of viability of quail embryos and chicks when eggs are exposed to gamma radiation and vibration as related to different terms of egg storage N87-12119

SPACE SHUTTLE ORBITERS
Investigation of the external flow analysis for density measurements at high altitude
[NASA-CR-172464] N87-11698
Continuous prediction of Spartan visibility from Orbiter over modeled free-flight mission
[NASA-TM-88242] N87-11825
Effects of forced and free convections on structural temperatures of shuttle orbiter during reentry flight
[NASA-TM-86600] N87-11998

SPACE SHUTTLE PAYLOADS
Development of data processing, interpretation and analysis system for remote sensing of trace atmospheric gas species
[NASA-CR-179882] N87-12059

SPACE SHUTTLES
Tradeoff methods in multiobjective insensitive design of airplane control systems N87-11730
Multidisciplinary approach to the design of high pressure oxygen systems N87-11780
Strategy for safely returning space shuttle to flight status
[GPO-63-144] N87-11823
Hearings before the Subcommittee on Space Science and Applications of the Committee on Science and Technology, 99th Congress, 2nd Session, No. 132, 25, 27 February; 11, 13, 20 March; 9, 10 April, 1986, Volume 2
[GPO-61-777] N87-12402

SPACE SIMULATORS
Computer simulation of on-orbit manned maneuvering unit operations
[NASA-CR-179904] N87-12245

SPACE STATIONS
Design, construction and utilization of a space station assembled from 5-meter erectable struts
[NASA-TM-89043] N87-11827
Strategic plan, 1985
[NASA-TM-89263] N87-12364

SPACE TECHNOLOGY EXPERIMENTS
Research and technology
[NASA-TM-86852] N87-12530

SPACE TRANSPORTATION SYSTEM
Strategy for safely returning space shuttle to flight status
[GPO-63-144] N87-11823

SPACE-TIME FUNCTIONS
Coupling visual and dynamic features to study handwritten signatures N87-12236

SPACEBORNE ASTRONOMY
Variability studies of 3C 371 — extragalactic radio source
[NASA-CR-179772] N87-12406
A research proposal on spectroscopy of gases and solids observed in the solar system N87-12489

SPACEBORNE EXPERIMENTS
Development of data processing, interpretation and analysis system for remote sensing of trace atmospheric gas species
[NASA-CR-179882] N87-12059

SPACECRAFT COMPONENTS
Behavior of an Inconel 718 container in the presence of hydrogen — spacecraft fuel tanks
[ESA-CR(P)-2262] N87-11863

SPACECRAFT CONTROL
Large wheel actuators definition study — spacecraft control
[TELDIX-15-020-880] N87-11934

SPACECRAFT DESIGN
IDEAS: A multidisciplinary computer-aided conceptual design system for spacecraft N87-11761
Dual structural-control optimization of large space structures N87-11786
Design, construction and utilization of a space station assembled from 5-meter erectable struts
[NASA-TM-89043] N87-11827

SPACECRAFT DOCKING
Commentary, diagram of MIR station N87-11810

SPACECRAFT DOCKING MODULES
Docking mechanisms technology study
[ESA-CR(P)-2273] N87-11833

SPACECRAFT INSTRUMENTS
Conceptual design of a synoptic interplanetary monitor platform at L sub 1 (SIMPL)
[AD-A166522] N87-11828
Activities report in space tribology
[ESA-ESTL-77] N87-12005
Development of data processing, interpretation and analysis system for remote sensing of trace atmospheric gas species
[NASA-CR-179882] N87-12059

SPACECRAFT LAUNCHING
Proposal for reaching an optimization of a solid combustion vehicle satellite launcher and its trajectory
[INPE-3966-TDL/232] N87-11822

SPACECRAFT LUBRICATION
Activities report in space tribology
[ESA-ESTL-77] N87-12005
SPACECRAFT MANEUVERS
Report on the dismantling and examination of Dornier System GmbH medium speed mechanism on completion of a seven year real-life test --- satellite antennas, platforms
[ESA-ESTL-65] N87-11835
SPACECRAFT MODELS
Component testing for dynamic model verification
N87-11765
Dual structural-control optimization of large space structures N87-11766
SPACECRAFT POWER SUPPLIES
Space-based laser-driven MHD generator: Feasibility study
[NASA-CR-178194] N87-11837
SPACECRAFT STABILITY
Tradeoff methods in multiobjective insensitive design of airplane control systems N87-11730
SPACECRAFT STRUCTURES
The automated strength-aeroelastic design of aerospace structures program N87-11749
SPACECRAFT TRACKING
Continuous prediction of Spartan visibility from Orbiter over modeled free-flight mission
[NASA-TM-86242] N87-11825
SPACETENNAS
Microcomputer design and analysis of the cable catenary large space antenna system N87-11762
SPARK GAPS
Statistical distributions of breakdown voltages in a high current spark gap
[DE86-012281] N87-11950
SPARTAN SATELLITES
Continuous prediction of Spartan visibility from Orbiter over modeled free-flight mission
[NASA-TM-86242] N87-11825
SPATIAL DISTRIBUTION
Research in expert interactive cartographic systems
[AD-A168337] N87-12041
Atmospheric electrical modeling in support of the NASA F106 Storm Hazards Project
[NASA-CR-179801] N87-12082
SPATIAL RESOLUTION
Spatially resolved quantitative spectroscopy of comets
N87-12471
SPECIFIC HEAT
Heat capacity and enthalpy of liquids: Alkanes
[ESDU-86007] N87-12377
SPECIFICATIONS
PS: A nonprocedural language with data types and modules
[NASA-CR-178196] N87-12246
SPECIMENS
Evaluation of waterjet-machined metal matrix composite tensile specimens
[DE86-012254] N87-11854
SPECKLE PATTERNS
Speckle interferometry applied to asteroids and other solar system objects N87-12449
SPECTRA
A measure of the randomness of signals and suggested applications
[AD-A168916] N87-11925
SPECTRAL BANDS
Planetary research at Lowell Observatory N87-12440
SPECTRAL CORRELATION
A new cross-correlation method to derive shifts from stellar spectra
[REPT-85-38] N87-12499
SPECTRAL EMISSION
Study of comets at wavelengths between 0.5 and 18 microns N87-12456
Ground-based observation of Comet Halley
N87-12458
SPECTRAL ENERGY DISTRIBUTION
Spectral distribution and variation of solar radiation
[DE86-012148] N87-12076
Surface vibrations and (2x1) superstructures on FCC(110) metal surfaces
[AD-A168786] N87-12367
SPECTRAL METHODS
Methods for stochastic spectral synthesis N87-12202
SPECTRAL REFLECTANCE
Detection of specularities in colour images using local operators N87-12235
Long-term changes in reflectivity and larger scale motions in the atmospheres of Jupiter and Saturn
N87-12412
Search for volatiles in the surface of icy satellites
N87-12414
Observations of comets and asteroids N87-12439
Infrared observations of small solar-system bodies
N87-12445
Asteroid team N87-12460
Planet-crossing asteroids: Interrelationships within the solar system N87-12462
Spectroscopic planetary detection N87-12481
The radial velocity search for extrasolar planets
N87-12485
SPECTRAL RESOLUTION
Spectral distribution and variation of solar radiation
[DE86-012148] N87-12076
A model for the liquid crystal light valve. Part 1: Analysis of charge trapping in the BSO and its effect on the device resolution
[BAE-BT-15609] N87-12376
Planetary infrared astronomy using a cryogenic postdisperser on Fourier transform spectrometers
N87-12422
High resolution spectral imagery of comets
N87-12470
SPECTRAL SIGNATURES
X-ray and radio images of four supernova remnants with three distinct X-ray signatures N87-12503
SPECTRAL THEORY
A new cross-correlation method to derive shifts from stellar spectra
[REPT-85-38] N87-12499
SPECTRORADIOMETERS
Teledetection by aquatic plants. Investigation of the possibilities of multispectral photography and spectroradiometry
[VLT-1985-11] N87-12045
SPECTROSCOPY
HALOE science investigation
[NASA-CR-179825] N87-11657
Supercritical fluid chromatography/supersonic jet spectroscopy
[DE86-011278] N87-11865
Deep-level transient spectroscopy studies of gallium arsenide - aluminum gallium arsenide heterostructures and superlattices
[AD-A168328] N87-12361
SPECTRUM ANALYSIS
Spectral content of a transmitted FM signal
[BAE-BT-15690] N87-11930
Characterization and discrimination of selected vegetation canopies from field observations of bidirectional reflectances
[NASA-CR-179837] N87-12037
Studies of extended planetary atmospheres
N87-12421
Outer planet studies N87-12426
A new cross-correlation method to derive shifts from stellar spectra
[REPT-85-38] N87-12499
SPIN REDUCTION
Report on the dismantling and examination of Dornier System GmbH medium speed mechanism on completion of a seven year real-life test --- satellite antennas, platforms
[ESA-ESTL-65] N87-11835
SPLINE FUNCTIONS
ASTERISK: An extensible testbed for spline development N87-12212
STABILITY
New high temperature absorbent for absorption heat pumps
[DE86-012483] N87-11976
An alternate method for determining atmospheric stability N87-12061
STABILITY AUGMENTATION
Tradeoff methods in multiobjective insensitive design of airplane control systems N87-11730
STABILIZERS (AGENTS)
High performance liquid chromatography of propellants. Part 1: Analysis of M1, M6, and M10 propellants
[AD-A168206] N87-11903
STACKS
Simplified design equations for an optical quarter-wave stack reflection filter
[AD-A168442] N87-12340
STAINLESS STEELS
Influence of displacement damage on deuterium permeation in 316 stainless steel
[DE86-010463] N87-11881
Inertial welding of 1100 aluminum to type 316 stainless steel
[DE86-009145] N87-11996
STANDARDIZATION
Local area networks: Characteristics, properties, and standardization
[SWA-85/193] N87-12271
STANDARDS
Telemetry standards
[AD-A168818] N87-11826
Results of the 1986 NASA/JPL Balloon Flight Solar Calibration Program
[NASA-CR-179916] N87-12048
Radio-frequency electromagnetic radiation: Radiation safety N87-12157
STAPHYLOCOCCUS
Sanitary and microbiological aspects of closed environment occupied by people and animals
N87-12121
STAR CLUSTERS
A photometric investigation of the rich supercluster fourteen fifty-one plus twenty-two N87-12507
STAR DISTRIBUTION
The evolution of active galactic nuclei N87-12516
STAR FORMATION
Topics in the theory of neutron star cooling
N87-12515
STARS
Techniques to improve astronomic positioning in the field
[AD-A168347] N87-12042
STATE ESTIMATION
Density of states due to pairing of impurities in semiconductor systems
[INPE-4009-PRE/1001] N87-12358
STATIC LOADS
Some observations on the behavior of the Langley model rotor blade
[NASA-CR-179880] N87-11695
STATIC PRESSURE
Pitot and static errors in steady level flight
[ESDU-86006] N87-11691
STATISTICAL ANALYSIS
Component testing for dynamic model verification
N87-11765
Mathematical and statistical analysis
[AD-A169277] N87-11830
Statistical strength comparison of metal matrix and polymeric matrix composites
[AD-A168647] N87-11850
Characterization and discrimination of selected vegetation canopies from field observations of bidirectional reflectances
[NASA-CR-179837] N87-12037
Controlling outliers in contingent valuation experiments
[PB86-210465] N87-12299
On the use of ridge and Stein-type estimators in prediction
[AD-A168349] N87-12302
Methods for calculating the probability distribution of sums of independent random variables
[AD-A170465] N87-12309
On the elementary theorems of decision theory
[AD-A170285] N87-12365
A user's guide to the socioeconomic environmental demographic information system (SEEDIS)
[AD-A168917] N87-12368
STATISTICAL DISTRIBUTIONS
Statistical distributions of breakdown voltages in a high current spark gap
[DE86-012281] N87-11950
STATISTICAL MECHANICS
Statistical mechanics of charged objects: General method and applications to simple systems
[AD-A168918] N87-12329
On the massive sine Gordon equation in all regions of collapse
[NOTA-INTERNA-858] N87-12378
STATISTICAL TESTS
Cumulative probability tables for testing consensus in ranking experiments
[AD-A168376] N87-12303
STATORS
Investigation of coating performance and corrosion of compressor components in the TF30-P-3 engine of F111C aircraft
[AD-A168802] N87-11792
STEADY FLOW
Application of viscous-inviscid interaction methods to transonic turbulent flows
[NASA-CR-179900] N87-11700
STEAM
Hydrogen: Air steam flammability limits and combustion characteristics at intermediate scale
[TI86-009861] N87-11871
STEELS
Acceptance criteria for welds in ASTM A106 grade B steel pipe and plate
[NASA-TM-89052] N87-11874
Carburizing steel for high temperature service
[AD-A168327] N87-11877
Absorption of CO2 laser beams by metallic alloys. Application to laser thermal treatment
[ISL-CO-217/85] N87-11990
Selection of rolling-element bearing steels for long-life application
[NASA-TM-88861] N87-11993

Reliable welding of HSLA steels by square wave pulsing using an advanced sensing (EDAP) technique
[AD-A168762] N87-11997
Correlation of fracture toughness and Charpy impact test results — steels
[TR1063] N87-12016
A wedge test for quantifying fully plastic fracture
[AD-A168607] N87-12023

STEERING
Laser based information systems (selected pages)
[AD-A168418] N87-11988

STELLAR COMPOSITION
Optical spectroscopic studies of Wolf-Rayet carbon and oxygen stars N87-12504

STELLAR ENVELOPES
Planetary optical and infrared imaging N87-12487

STELLAR EVOLUTION
Optical investigation of Comet Halley N87-12457
Origin of asteroids and small bodies N87-12477
Spectroscopy of comets N87-12478
Planetary optical and infrared imaging N87-12487

STELLAR FLARES
Multiwavelength studies of Cygnus X-3 N87-12502

STELLAR MASS ACCRETION
The physical characteristics of the X-ray emitting gas in clusters of galaxies and constraints on dark matter N87-12514

STELLAR OCCULTATION
Portable high speed photometry systems for observing occultations N87-12416
Interiors of the giant planets N87-12420
Studies of extended planetary atmospheres N87-12421
Infrared observations of outer planet satellites N87-12423
Research in planetary astronomy at Palomar Observatory N87-12435
Observations of comets and asteroids N87-12439
Infrared observations of small solar-system bodies N87-12446
Asteroid team N87-12460
Occultation studies of the solar system N87-12463

STELLAR ORBITS
Recovery of the UCAS asteroids N87-12469
A search for Earth-approaching asteroids N87-12472
Cometary dynamics N87-12479
International Halley Watch: Discipline specialists for astronomy N87-12497

STELLAR PHYSICS
Workshop on Earth-Orbital Planetary Astronomy N87-12480

STELLAR RADIATION
Non-thermal radiation mechanisms and processes in SS 433 and active galactic nuclei N87-12511

STELLAR SPECTRA
Spectroscopic planetary detection N87-12481
Determination of stellar radial velocity precision attainable with a coude spectrograph N87-12483
Stellar observations with the Voyager EUV objective grating spectrograph N87-12484
A new cross-correlation method to derive shifts from stellar spectra
[REPT-85-36] N87-12499
Optical spectroscopic studies of Wolf-Rayet carbon and oxygen stars N87-12504
An XUV spectroscopic observation of the white dwarf star HZ 43 N87-12505

STELLAR SPECTROPHOTOMETRY
Outer planet studies N87-12426
Infrared spectral studies of asteroids N87-12441
Composition of faint comets N87-12445
Planetary astronomy N87-12448
Photometry of small asteroids and cometary cores N87-12451
CCD scanning for asteroids and comets N87-12452
Radiative transfer in planetary atmospheres N87-12456
Cometary spectroscopy N87-12458
Infrared observations of planets N87-12459
Physical processes in comets N87-12465
Physical properties of asteroids N87-12475
International Halley Watch: Discipline specialists for spectroscopy and spectrophotometry N87-12496

STIRLING CYCLE
Arctic communications techniques: Remote unattended power systems
[AD-A168289] N87-11918

STIRLING ENGINES
Free-piston Stirling engine development
[PB86-213980] N87-12010
Ceramic automotive Stirling engine program
[NASA-CR-175042] N87-12047

STOCHASTIC PROCESSES
The stochastic modelling of trees N87-12201
Methods for stochastic spectral synthesis N87-12202
Research in adaptive and decentralized stochastic control
[AD-A168752] N87-12275
Simulation of a stochastic process with a nonrational spectrum
[FOA-C-20614-E3] N87-12295
A central limit theorem for Markov paths and some properties of Gaussian random fields
[AD-A170258] N87-12307
Stochastic integration for operator valued processes on Hilbert spaces and on nuclear spaces
[AD-A168501] N87-12315
Stochastic mechanics of a Dirac particle in two space-time dimensions
[PREPRINT-474] N87-12381

STORAGE STABILITY
Effect of long-term storage on some parameters of fat ingredient of freeze-dried products N87-12118

STORMS
Wind profiling of stormy and quiescent atmospheres with microwave radars
[PB86-212545] N87-12094

STRAIN GAGES
Verifying strain gage installations for dynamic tests
[DE86-006469] N87-11985

STRAIN RATE
Studies of strain rate effects in the deformation of solids by means of stress pulses and ultrasonic methods
[DE86-012208] N87-12025

STRAITS
Solutions in straits of varying width and depth
[PREPRINT-465] N87-12101

STRANGENESS
Strange dibaryons — pion-kaon interactions on deuterium
[NOTA-INTERNA-865] N87-12331

STRATEGY
SDI (Strategic Defense Initiative) Program: Evaluation of DOE's (Department of Energy's) answers to questions on X-ray laser experiment, briefing report
[PB86-209238] N87-11808
Strategy for safely returning space shuttle to flight status
[GPO-63-144] N87-11823
Strategic plan, 1985
[NASA-TM-89263] N87-12384

STRATIGRAPHY
An ecologic study of peat landforms in Canada and Alaska
[NASA-CR-179740] N87-12033

STRATOSPHERE
Measurement of H02 and other trace gases in the stratosphere using a high resolution far-infrared spectrometer at 28 KM
[NASA-CR-179896] N87-12069
A Monte Carlo description of the sampling of stratospheric ion clusters via a mass spectrometer
[AD-A168523] N87-12071

STRATUS CLOUDS
Comparative flight measurement of icing parameters for the DO 28 D2 propeller-driven aircraft of the German Army Testing Office 61 and for DFVLR's Falcon 20 E jet aircraft in stratus clouds
[ESA-TT-941] N87-11709

STRESS (BIOLOGY)
Effect of hydrocortisone on osteogenic function of mouse bone marrow N87-12122

STRESS (PHYSIOLOGY)
Endocrine status of cosmonauts following long-term space missions N87-12146
Human exercise and heat exchange in thermal environments
[AD-A168746] N87-12154
Psychological concepts in a parallel system
[AD-A169615] N87-12390

STRESS (PSYCHOLOGY)
Biochemical indicators of emotional stress in air traffic controllers N87-12129
An application of multidimensional scaling to describe stress among naval helicopter pilots
[AD-A168367] N87-12162

STRESS ANALYSIS
Applying, measuring and maintaining pretension in steel bolts
[ESDU-86014] N87-12015
Studies of strain rate effects in the deformation of solids by means of stress pulses and ultrasonic methods
[DE86-012208] N87-12025
Finite element fracture analysis on microcomputer
[TI86-006214] N87-12028
A thin cylinder problem
[AD-A168665] N87-12251

STRESS CONCENTRATION
Example of the use of Data Item No. 85001. Choice of reinforcement for a circular hole in a fibre reinforced laminated plate. (Data relating to one particular set of laminate properties)
[ESDU-86003] N87-11844
Statistical strength comparison of metal matrix and polymeric matrix composites
[AD-A168847] N87-11850
A thin cylinder problem
[AD-A168665] N87-12251

STRESS CORROSION
Surface chemistry and structural effects in the stress corrosion of glass and ceramic materials
[AD-A170243] N87-11896

STRESS CORROSION CRACKING
Corrosion information and analysis: Corrosion and compatibility
[BMI-CIA-14] N87-11872
Performance demonstration tests for detection of intergranular stress corrosion cracking
[TI86-007894] N87-11888

STRESS-STRAIN RELATIONSHIPS
Example of the use of Data Item No. 85001. Choice of reinforcement for a circular hole in a fibre reinforced laminated plate. (Data relating to one particular set of laminate properties)
[ESDU-86003] N87-11844
The role of damage-softened material behavior in the fracture of composites and adhesives
[NASA-CR-179840] N87-11848
Structural evaluation of high strain fiber and resin composite material systems
[AD-A170464] N87-11852

STRETCHING
Stretched cusps in coupler curves: Four-bar linkages having Ball-modal coupler points
[EUT-84-W-001] N87-12008

STRING THEORY
Supersymmetry: Proceedings
[DE86-007853] N87-12334

STRINGS
Soliton surfaces 7. Relativistic string in external field: General integral and particular solutions
[PREPRINT-467] N87-12379

STRUCTURAL ANALYSIS
PIAS: A program for an iterative aeroelastic solution N87-11725
Structural Optimization in automotive design N87-11729
STAEBL: Structural tailoring of engine blades, phase 2 N87-11731
Shape design sensitivity analysis of built-up structures N87-11745
Application of modern structural optimization to vibration reduction in rotorcraft N87-11752
Optimization of helicopter rotor blade design for minimum vibration N87-11756
IDEAS: A multidisciplinary computer-aided conceptual design system for spacecraft N87-11761
Structural optimization with constraints on transients response N87-11767
Optimization applications in aircraft engine design and test N87-11768
Problems in large-scale structural optimization N87-11770
Structural optimization of large ocean-going structures N87-11771
Structural evaluation of high strain fiber and resin composite material systems
[AD-A170464] N87-11852
User manual for BUNVIS-RG: An exact buckling and vibration program for lattice structures, with repetitive geometry and substructuring options
[NASA-TM-87669] N87-12018

STRUCTURAL DESIGN
Recent Experiences in Multidisciplinary Analysis and Optimization, part 1
[NASA-CP-2327-PT-1] N87-11717
Structural synthesis: Precursor and catalyst N87-11718
Practical considerations in aeroelastic design N87-11720
Flutter optimization in fighter aircraft design N87-11721
The role of optimization in structural model refinement N87-11724
A nonlinear programming method for system design with results that have been implemented N87-11735
The automated strength-aeroelastic design of aerospace structures program N87-11749
Optimization of helicopter rotor blade design for minimum vibration N87-11756
Application of numerical optimization to rotor aerodynamic design N87-11757

The structural optimization of a spreader bar for twin lift helicopter operations N87-11758
Problems in large-scale structural optimization N87-11770
Fundamental differences between optimization code test problems in engineering applications N87-11772
Comments on gust response constrained optimization N87-11774
On the utilization of engineering knowledge in design optimization N87-11777
Shape optimization including finite element grid adaptation N87-11779
A study of large space structures [LR46869] N87-11832
Effectiveness: N sub TU relationships for the design and performance evaluation of two-stream heat exchangers [ESDU-86018] N87-11959
Interactive 3-D modeling with personal computers N87-12203
SMP: A solid modeling program version 2.0 [NASA-CR-178133] N87-12244
A thin cylinder problem [AD-A168865] N87-12251

STRUCTURAL DESIGN CRITERIA
The 3600 hp split-torque helicopter transmission [NASA-CR-174932] N87-11788
A study of large space structures [LR46869] N87-11832

STRUCTURAL ENGINEERING
A conceptual basis for the design of damage-tolerant structural systems N87-11773

STRUCTURAL FAILURE
A conceptual basis for the design of damage-tolerant structural systems N87-11773
Enhancements to the STAGS computer code [NASA-CR-4000] N87-12019

STRUCTURAL MEMBERS
Effects of forced and free convections on structural temperatures of shuttle orbiter during reentry flight [NASA-TM-86600] N87-11968

STRUCTURAL PROPERTIES (GEOLOGY)
A numerical study of diffraction in reentrant geologic structure [AD-A168562] N87-12072

STRUCTURAL RELIABILITY
Statistical strength comparison of metal matrix and polymeric matrix composites [AD-A168647] N87-11850

STRUCTURAL STABILITY
Qualitative results for distributed systems with discrete and stiffness with application to control [AD-A168622] N87-11829

STRUCTURAL STRAIN
Structural evaluation of high strain fiber and resin composite material systems [AD-A170484] N87-11852

SUBMERGING
Central hemodynamic parameters during dry immersion of patients with borderline hypertension N87-12142

SUBMILLIMETER WAVES
Submillimeter and millimeter observations of solar system objects N87-12426

SUBSONIC FLOW
Tip vortices of wings in subsonic and transonic flow: A numerical simulation [NASA-TM-88334] N87-11899
Improvement of mechanical model in the entrainment method for compressible turbulent boundary layer [AD-A168451] N87-11970

SUBSTRATES
Method for producing a thin polyimide film on a silicon substrate — integrated circuits [BAE-BT-14810] N87-11898

SUCTION
Applications of CONMIN to wing design optimization with vortex flow effect N87-11737

SUDAN
Tectonic evaluation of the Nubian shield of Northeastern Sudan using thematic mapper imagery [NASA-CR-177045] N87-12070

SULFURIC ACID
Corrosion resistance of selected ceramic materials to sulfuric acid, report of investigations [PB86-212354] N87-11901

SUMMARIES
Summary of control and data acquisition systems for Nova experiments [DE86-010563] N87-11989

SUPERCOMPUTERS
Research in very high performance computing: Policy recommendation and research requirements statement [PB86-209723] N87-12174

SUPERCRITICAL FLUIDS
Supercritical fluid chromatography/supersonic jet spectroscopy [DE86-011278] N87-11865

SUPERHIGH FREQUENCIES
Techniques for microwave dielectric measurements [AD-A168300] N87-11919
The Arecibo S-band radar program N87-12408

SUPERLATTICES
Semiconductor superlattice photodetectors [NASA-CR-179850] N87-12355
Deep-level transient spectroscopy studies of gallium arsenide - aluminum gallium arsenide heterostructures and superlattices [AD-A168329] N87-12361

SUPERNOVA REMNANTS
X-ray and radio images of four supernova remnants with three distinct X-ray signatures N87-12503

SUPERNOVAE
Topics in the theory of neutron star cooling N87-12515

SUPERSONIC AIRCRAFT
Applications of CONMIN to wing design optimization with vortex flow effect N87-11737

SUPERSONIC CRUISE AIRCRAFT RESEARCH
Applications of CONMIN to wing design optimization with vortex flow effect N87-11737

SUPERSONIC JET FLOW
Supercritical fluid chromatography/supersonic jet spectroscopy [DE86-011278] N87-11865

SUPERSYMMETRY
Supersymmetry: Proceedings [DE86-007853] N87-12334

SURFACE ACOUSTIC WAVE DEVICES
Radon optical processing in radon space [AD-A169612] N87-11943

SURFACE CRACKS
The surface crack problem in an orthotropic plate under bending and tension [NASA-CR-179692] N87-12020

SURFACE FINISHING
Performance limits of surface-hardened aluminum-alloy gears in vacuum [ESA-ESTL-059] N87-11884

SURFACE PROPERTIES
Carburizing steel for high temperature service [AD-A168327] N87-11877
Real time oceanographic analysis for the south western Australian area for July 1984 to August 1985 [AD-A168741] N87-12100
Survey of texture mapping N87-12207
Electron tunneling microscopy [AD-A168234] N87-12359

SURFACE REACTIONS
Surface chemistry and structural effects in the stress corrosion of glass and ceramic materials [AD-A170243] N87-11896
Simulation studies for surfaces and materials strength [NASA-CR-177046] N87-12357
Topical Meeting on Microphysics of Surfaces, Beams and Adsorbates held at Santa Fe, New Mexico on 4 - 6 February 1985 [AD-A168618] N87-12364

SURFACE ROUGHNESS
Hardware assistance for Z-buffer visible surface algorithms N87-12205

SURVEILLANCE RADAR
Mode S beacon system: Functional description [DOT/FAA/PM-86/19] N87-11715

SURVEYS
General aviation activity and avionics survey [AD-A168582] N87-11686
Joining methods for beryllium: A survey [DE86-012000] N87-12002
NTIS (National Technical Information Service) privatization study responses to April 28, 1986 Federal register notice request for public comment [PB86-211240] N87-12398
Public perspectives on government information technology: A review of survey research on privacy, civil liberties and the democratic process [PB86-218419] N87-12399

SWEAT COOLING
Slowly-developing modifications in cutaneous circulatory control [AD-A168702] N87-12152

SWEPT FORWARD WINGS
Forward-swept wing configuration designed for high maneuverability by use of a transonic computational method [NASA-TP-2628] N87-11702

SWEPT WINGS
Applications of CONMIN to wing design optimization with vortex flow effect N87-11737

SWIRLING
User's manual for a TEACH computer program for the analysis of turbulent, swirling reacting flow in a research combustor [NASA-CR-179547] N87-11858

SWITCHES
Engineering limits of photoconductive semiconductor switches in pulsed power applications [DE86-012282] N87-11951

SYMMETRY
Complete symmetry in D2L systems and cellular automata [INF-85-14] N87-12172

SYNCHRONISM
Multiple task oriented processor [AD-D012392] N87-12170

SYNCHROTRON RADIATION
Variability studies of 3C 371 — extragalactic radio source [NASA-CR-179772] N87-12406
Non-thermal radiation mechanisms and processes in SS 433 and active galactic nuclei N87-12511

SYNTHESIS (CHEMISTRY)
Application of computer techniques in the prediction of inorganic compounds [PB86-205782] N87-11870
Environmentally stable polymers and coatings for space application: CH-5, supplement 10 [NASA-CR-177181] N87-11890
High-purity, fine-particle boron nitride powder synthesis at -75 to 750C, report of investigations [PB86-217940] N87-11900

SYNTHETIC APERTURE RADAR
Advanced SAR study — satellite-borne radar [BLS-6345] N87-11931

SYSTEM EFFECTIVENESS
System safety procedures for nondevelopment item (NDI) acquisitions [AD-A168353] N87-12012

SYSTEMS ANALYSIS
Post and a random-walk search mode N87-11764
Theoretical and experimental investigations of sensor location for optimal aeroelastic system state estimation N87-11794
Catalytic combustion component and system prototype development [PB86-211380] N87-11889
Complete symmetry in D2L systems and cellular automata [INF-85-14] N87-12172
Definition, study and design of a specific self-checking microprocessor COBRA [ETN-86-98402] N87-12173
On realization of nonlinear systems described by higher-order differential equations [MEMO-589] N87-12297
Use of fuzzy sets mathematics to assist pavement evaluation and management. Executive summary (revised March 18, 1986) [PB86-214760] N87-12298

SYSTEMS ENGINEERING
A nonlinear programming method for system design with results that have been implemented N87-11735
A conceptual basis for the design of damage-tolerant structural systems N87-11773
Computer aided analysis and optimization of mechanical system dynamics N87-11778
Multidisciplinary approach to the design of high pressure oxygen systems N87-11780
EHF (Extremely High Frequency) telecommunications system engineering model [PB86-214814] N87-11937
Power system applications of fiber optic sensors [NASA-CR-179921] N87-12337

SYSTEMS MANAGEMENT
Managing software complexity [ERL-0372-RE] N87-12248

SYSTOLIC ARRAYS
Systolic array synthesis: Computability and time cones [AD-A168697] N87-12287

T

TAPES
Automated tape laying machine for composite structures [AD-D012366] N87-11851

TARGET ACQUISITION
Satellite tracking and observability [AD-A168394] N87-11618
Development of vision tests for air-to-air target detection [AD-A168309] N87-12161

TARGET RECOGNITION
Development of vision tests for air-to-air target detection [AD-A168309] N87-12161

The extraction of knowledge from data: An evaluation of Intelligent Knowledge Based Systems (IKBS) — image processing
[BAE-BT-15035] N87-12276

TARGETS
Research in expert interactive cartographic systems
[AD-A169337] N87-12041
Ocular hazards associated with laser exposure
[AD-A168506] N87-12151

TASKS
Graphics tools in Adagio, a robotics multitasking multiprocessor workstation N87-12191
Goal directed animation using English motion commands N87-12198

TECHNOLOGICAL FORECASTING
US long distance fiber optic networks: Technology, evolution and advanced concepts. Volume 3: Advanced networks and economics
[NASA-CR-179481] N87-11915

TECHNOLOGY ASSESSMENT
US long distance fiber optic networks: Technology, evolution and advanced concepts. Volume 3: Advanced networks and economics
[NASA-CR-179481] N87-11915
Advanced SAR study — satellite-borne radar
[BLS-6345] N87-11931
Biennial science and technology report to the Congress, 1983-1984
[PB86-209632] N87-12403

TECHNOLOGY TRANSFER
Technology transfer primer
[PB86-205341] N87-12404
Research and technology, 1986
[NASA-TM-89037] N87-12531

TECHNOLOGY UTILIZATION
Research in very high performance computing: Policy recommendation and research requirements statement
[PB86-209723] N87-12174

TECTONICS
Tectonic evaluation of the Nubian shield of Northeastern Sudan using thematic mapper imagery
[NASA-CR-177045] N87-12070

TELECOMMUNICATION
Arctic communications techniques: Remote unattended power systems
[AD-A168289] N87-11918
EHF (Extremely High Frequency) telecommunications system engineering model
[PB86-214814] N87-11937
Publications of the Jet Propulsion Laboratory, 1984
[NASA-CR-179870] N87-12386
A user's guide to the socioeconomic environmental demographic information system (SEEDIS)
[AD-A168917] N87-12388

TELEMETRY
Telemetry standards
[AD-A168818] N87-11826
Teledetection by aquatic plants. Investigation of the possibilities of multispectral photography and spectroradiometry
[VLT-1985-11] N87-12045
Real time oceanographic analysis for the south western Australian area for July 1984 to August 1985
[AD-A169741] N87-12100

TELESCOPES
Large optics technology
[AD-A168222] N87-12309

TEMPERATURE DEPENDENCE
Kinetic and spectroscopic studies of chemical intermediates at both high and low temperatures
[AD-A168758] N87-11861
Numerical routines for predicting ignition in pyrotechnic devices
[DE86-013251] N87-11909

TEMPERATURE EFFECTS
Discussion of the effect of temperature on the very short term properties of metals and alloys — high speed flight
[BAE-BT-14842] N87-11882
Calculation methods for steadily loaded axial groove hydrodynamic journal bearings. Low viscosity process fluid lubrication.
[ESDU-86006] N87-11991

TEMPERATURE MEASUREMENT
Calorimetric measurements of the equivalent series resistance of low-loss, high repetition rate pulse discharge capacitors
[DE86-011232] N87-11948
Effects of forced and free convections on structural temperatures of shuttle orbiter during reentry flight
[NASA-TM-86800] N87-11968

TENSILE STRENGTH
Evaluation of waterjet-machined metal matrix composite tensile specimens
[DE86-012254] N87-11954
Mechanical properties of various alloys in hydrogen
[NASA-CR-179874] N87-11889

TENSILE STRESS
The surface crack problem in an orthotropic plate under bending and tension
[NASA-CR-179892] N87-12020

TENSOR ANALYSIS
Boundary layer and parabolic flows
[ESA-TT-918] N87-11979

TERNARY ALLOYS
Zone leveling and solution growth of complex compound semiconductors in space
[NASA-CR-179884] N87-12356

TERNARY SYSTEMS
Zone leveling and solution growth of complex compound semiconductors in space
[NASA-CR-179884] N87-12356

TERRAIN
Remote sensing of Earth Terrain
[NASA-CR-177185] N87-12038
The representation of water N87-12209

TERRAIN ANALYSIS
Terrain classification for regional transport models
[KNMI-TR-81(FM)] N87-12063

TERRESTRIAL PLANETS
Goldstone solar system radar N87-12409

TEST FACILITIES
SP-100 ground engineering system test at Hanford Potential Bidders' Site Tour, December 18, 1985
[DE86-009954] N87-12335

TETHERED SATELLITES
Analytical investigation of the dynamics of tethered constellations in Earth orbit, phase 2
[NASA-CR-178953] N87-11815

TEXAS
Characterization and discrimination of selected vegetation canopies from field observations of bidirectional reflectances
[NASA-CR-179837] N87-12037

TEXTILES
Some implications of dynamic structural analysis N87-12176

TEXTURES
Survey of texture mapping N87-12207
Image segmentation based on color and texture gradient N87-12217
A computational theory of 3D shape reconstruction from image contours N87-12225
Cortical representation of texture primitives N87-12227
Three processing characteristics of texture discrimination N87-12230
Sequential estimation of boundaries in texture images N87-12234

THEMATIC MAPPING
Interpreting forest and grassland biome productivity utilizing nested scales of image resolution and biogeographical analysis
[NASA-CR-176803] N87-12029
Interpreting forest and grassland biome productivity utilizing nested scales of image resolution and biogeographical analysis
[NASA-CR-179739] N87-12032
Thematic mapper study of Alaskan ophiolites
[NASA-CR-179728] N87-12035
Tectonic evaluation of the Nubian shield of Northeastern Sudan using thematic mapper imagery
[NASA-CR-177045] N87-12070
A context based technique for smoothing of digital thematic maps N87-12219

THERMAL ABSORPTION
Absorption of CO2 laser beams by metallic alloys. Application to laser thermal treatment
[ISL-CO-217/85] N87-11990

THERMAL ANALYSIS
IDEAS: A multidisciplinary computer-aided conceptual design system for spacecraft N87-11781
Thermal analysis of radiometer containers for the 122m hoop column antenna concept
[NASA-TM-89026] N87-11966

THERMAL BATTERIES
Combining automatic titration of total iron and sulfur in thermal battery materials
[DE86-007802] N87-11946

THERMAL CONDUCTIVITY
Thermal conductivity of pristine and brominated P-100 fibers
[NASA-TM-88863] N87-11883
Measurement and prediction of liquid mixture thermal conductivity and viscosity
[DE86-012508] N87-11977

THERMAL DECOMPOSITION
Mass spectrometric investigation of the thermal decomposition of several propellant and explosive ingredients
[AD-A168611] N87-11905

THERMAL EXPANSION
Calculation methods for steadily loaded axial groove hydrodynamic journal bearings. Low viscosity process fluid lubrication.
[ESDU-86006] N87-11991

THERMAL FATIGUE
Fatigue properties of high strength titanium alloys at elevated temperatures (IMI 685)
[DFVLR-FB-86-19] N87-11885

THERMAL INSULATION
Thermal barrier coating life prediction model development
[NASA-CR-179508] N87-11892

THERMAL MAPPING
Infrared observations of planets N87-12489

THERMAL PLASMAS
Stationary solutions of the Vlasov-Fokker-Planck equation — plasma equilibrium
[PREPRINT-104] N87-12294

THERMAL PROTECTION
Thermal analysis of radiometer containers for the 122m hoop column antenna concept
[NASA-TM-89026] N87-11966

THERMAL RADIATION
Design study of a push-broom imager for the thermal infrared
[MATRA-094/PH/UB/137.85] N87-12348
Study of comets at wavelengths between 0.5 and 18 microns N87-12489

THERMAL RESISTANCE
Heat resistant matrix materials — advanced composite materials
[FOA-C-20618-2.1] N87-11886

THERMAL STABILITY
Stationary solutions of the Vlasov-Fokker-Planck equation — plasma equilibrium
[PREPRINT-104] N87-12294

THERMAL VACUUM TESTS
Report on the dismantling and examination of Dornier System GmbH medium speed mechanism on completion of a seven year real-life test — satellite antennas, platforms
[ESA-ESTL-65] N87-11836

THERMIONIC CATHODES
Thermionic Cathode Project
[AD-A168589] N87-11941

THERMIONIC EMISSION
Deep-level transient spectroscopy studies of gallium arsenide - aluminum gallium arsenide heterostructures and superlattices
[AD-A169328] N87-12361

THERMISTORS
Preliminary estimates of radiosonde thermistor errors
[NASA-TP-2637] N87-12089

THERMOCHEMISTRY
Receiver/reactor concepts for thermochemical transport of solar energy
[DE86-010959] N87-12064

THERMODYNAMIC COUPLING
Statistical mechanics of charged objects: General method and applications to simple systems
[AD-A169918] N87-12329

THERMODYNAMIC PROPERTIES
Absorption of CO2 laser beams by metallic alloys. Application to laser thermal treatment
[ISL-CO-217/85] N87-11990
Data processing and case study analysis of thunderstorm studies
[NASA-CR-179890] N87-12083

THERMOELECTRIC GENERATORS
Research on materials related to the sodium heat engine
[DE86-012639] N87-12004

THERMOPLASTIC RESINS
Molecular characteristics of thermoplastic polyimides as functions different cure cycles
[FOA-C-20603-F9] N87-11888

THERMOREGULATION
Slowly-developing modifications in cutaneous circulatory control
[AD-A168702] N87-12152
Human exercise and heat exchange in thermal environments
[AD-A168746] N87-12154

THICK WALLS
Lightweight sidewalls for aircraft interior noise control
[NASA-CR-172490] N87-12523

THIN FILMS
Method for producing a thin polyimide film on a silicon substrate — integrated circuits
[BAE-BT-14810] N87-11889
Research on high-efficiency single-junction monolithic thin-film amorphous silicon solar cells
[DE86-004453] N87-12061

Interfacial properties of germanium nitride dielectric layers in germanium
[AD-A168332] N87-12362
Preparation and investigation of amorphous gallium arsenide films
[AD-A168907] N87-12369
Interfacial reactions between amorphous W-Si thin films and polycrystalline overlayers
[DE86-006958] N87-12372
Density of states at mid gap in hydrogenated amorphous silicon
[DE86-011403] N87-12373

THIN WALLED SHELLS
A thin cylinder problem
[AD-A168865] N87-12251

THREADS
Applying, measuring and maintaining pretension in steel bolts
[ESDU-86014] N87-12015

THREE DIMENSIONAL BODIES
Interactive 3-D modeling with personal computers N87-12203

THREE DIMENSIONAL FLOW
Calculation of water drop trajectories to and about arbitrary three-dimensional lifting and nonlifting bodies in potential airflow
[NASA-CR-3935] N87-11694
A viscous/inviscid zonal method for the computation of 2 and 3-dimensional compressible fluid flows with separation N87-11958

THREE DIMENSIONAL MOTION
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A168450] N87-11685

THRESHOLD GATES
LSI/VLSI ion implanted planar GaAs IC processing
[AD-A168786] N87-12366

THRUST CONTROL
Electro-optical control of solid fuel rocket burn rate
[AD-D012997] N87-11839

THUNDERSTORMS
Data processing and case study analysis of thunderstorm studies
[NASA-CR-179890] N87-12063

THYMUS GLAND
Stress and neuroendocrine regulation of immune responses
[AD-A168768] N87-12155

TIME
HF (High Frequency) absolute time of arrival sensing
[AD-A168275] N87-11917

TIME DEPENDENCE
Temporal tuning effects in the visually evoked response
[AD-A168219] N87-12149
Low level decimetric (1.6 GHz) solar burst activity
[INPE-4004-PRE/997] N87-12524
Relative timings of MM-waves and associated M-waves solar bursts
[INPE-4013-PRE/1004] N87-12525

TIME FUNCTIONS
DFR (Decreasing Failure Rate) property of first passage times and its preservation under geometric compounding
[AD-A168671] N87-12304

TIME LAG
Design of a control system for a cryogenic wind tunnel optimizing a vector performance index
[ESA-TT-965] N87-11804

TIME OF FLIGHT SPECTROMETERS
New experiments to constrain the coefficients of the Robertson transformations for inertial systems
[NASA-CR-179906] N87-12320

TIME OPTIMAL CONTROL
Design of a control system for a cryogenic wind tunnel optimizing a vector performance index
[ESA-TT-965] N87-11804

TIME SERIES ANALYSIS
Real time oceanographic analysis for the south western Australian area for July 1984 to August 1985
[AD-A168741] N87-12100
Optimal sampling rates for auto regressive models
[AD-A168740] N87-12298
Asymptotic distributions of functions of the eigenvalues of the sample covariance matrix and canonical correlation matrix in multivariate time series
[AD-A170262] N87-12308

TIMOSHENKO BEAMS
The role of damage-softened material behavior in the fracture of composites and adhesives
[NASA-CR-179840] N87-11846

TIP VANES
Lift and drag measurements on a towing tank model of a tip vane turbine
[IW-R512] N87-11980
Survey of partial reports on the investigation of tip vanes
[IW-R514] N87-12057

TISSUES (BIOLOGY)
Distinctions of capillarization of white rat skeletal muscle during adaptation to high altitude of the Pamirs and Antarctica N87-12117

TITANIUM ALLOYS
Fatigue properties of high strength titanium alloys at elevated temperatures (IMI 685)
[DFVLR-FB-86-19] N87-11885
Absorption of CO2 laser beams by metallic alloys. Application to laser thermal treatment
[ISL-CO-217/85] N87-11990

TITRATION
Combining automatic titration of total iron and sulfur in thermal battery materials
[DE86-007802] N87-11946

TOPOGRAPHY
Thematic mapper study of Alaskan ophiolites
[NASA-CR-179728] N87-12035
A numerical study of diffraction in reentrant geologic structure
[AD-A168562] N87-12072

TOPOLOGY
Practical considerations of the topological approach to electromagnetic interference control
[AD-A168518] N87-11921
N-dimensional totally disconnected topological groups
[REPT-296] N87-12318

TOROIDAL PLASMAS
Ground-based observations of the Jupiter plasma torus N87-12432

TORQUE
Applying, measuring and maintaining pretension in steel bolts
[ESDU-86014] N87-12015

TORQUE CONVERTERS
The 3600 hp split-torque helicopter transmission
[NASA-CR-174932] N87-11786

TORQUE MOTORS
Performance characteristics of a GEC servoamplifier and permanent magnet electric motor
[LR48720] N87-11954

TOUGHNESS
Carburizing steel for high temperature service
[AD-A168327] N87-11877

TOWED BODIES
The structural optimization of a spreader bar for twin lift helicopter operations N87-11759

TOXIC DISEASES
Paramecium test for toxic substances in human blood during simulated weightlessness N87-12115

TRACE CONTAMINANTS
Evaluation of method for collecting and concentrating organic trace impurities in air N87-12145

TRACE ELEMENTS
Effects of microwave radiation on the blood-brain barrier
[PB86-213220] N87-12158

TRACKING (POSITION)
Laser based information systems (selected pages)
[AD-A168418] N87-11988
Ocular hazards associated with laser exposure
[AD-A168506] N87-12151

TRACKING FILTERS
International Halley Watch: Discipline specialists for photometry and polarimetry N87-12491

TRACKING NETWORKS
The International Halley Watch N87-12490

TRAINING SIMULATORS
Star City: On the 25th anniversary of the cosmonaut training center N87-11811

TRAJECTORIES
Proposal for reaching an optimization of a solid combustion vehicle satellite launcher and its trajectory
[INPE-3968-TDL/232] N87-11822

TRAJECTORY ANALYSIS
Calculation of water drop trajectories to and about arbitrary three-dimensional lifting and nonlifting bodies in potential airflow
[NASA-CR-3935] N87-11694

TRANSATMOSPHERIC VEHICLES
National aeronautical R and D goals: Technology for America's future
[PB86-209772] N87-12405

TRANSFER FUNCTIONS
Asymptotic solutions to compressible laminar boundary-layer solutions for dusty-gas flow over a semi-infinite flat plate
[UTIAS-310] N87-11967

TRANSITION TEMPERATURE
The effect of high pressure on electrical relaxation in PPO and electrical conductivity in PPO complexed with lithium salts
[AD-A168894] N87-11862

TRANSMISSION CIRCUITS
A multilayer channel router for nonrectangular channels — wiring
[INF-86-9] N87-11957

TRANSMISSION LINES
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A168450] N87-11685

TRANSMISSION LOSS
Window acoustic study for advanced turboprop aircraft
[NASA-CR-172391] N87-12322

TRANSMISSIONS (MACHINE ELEMENTS)
The 3600 hp split-torque helicopter transmission
[NASA-CR-174932] N87-11786

TRANSMITTANCE
A study in the variation in atmospheric transmission of different temperature blackbody sources in the 3.85 - 4.85 micron waveband
[BAE-BT-16206] N87-12078

TRANSMITTERS
Development of Traveling Wave Tube (TWT) transmitter amplifier for communication satellites 60 GHz/10 W
[BMFT-FB-W-85-030] N87-11953

TRANSONIC FLOW
Acta Aerodynamica Sinica (selected articles)
[AD-A168449] N87-11684
Normal force, pitching moment and side force of axisymmetric forebody-cylinder combinations for angles of attack up to 90 degrees and Mach numbers up to 1.2
[ESDU-86009] N87-11690
Tip vortices of wings in subsonic and transonic flow: A numerical simulation
[NASA-TM-88334] N87-11699
Application of viscous-inviscid interaction methods to transonic turbulent flows
[NASA-CR-179900] N87-11700
Analytic solutions of the nonlinear partial differential equations for transonic flow in physical spaces
[DFVLR-FB-86-14] N87-11705
Calculated effects of varying Reynolds Number and dynamic pressure on flexible wings at transonic speeds N87-11736
The prediction of transonic loading advancing helicopter rotors
[AD-A168217] N87-11781
Improvement of mechanical model in the entrainment method for compressible turbulent boundary layer
[AD-A168451] N87-11970

TRANSONIC SPEED
Forward-swept wing configuration designed for high maneuverability by use of a transonic computational method
[NASA-TP-2626] N87-11702

TRANSONIC WIND TUNNELS
Calculated effects of varying Reynolds Number and dynamic pressure on flexible wings at transonic speeds N87-11736
Methods for assessing wall interference in the 2- by 2-foot adaptive-wall wind tunnel
[NASA-TM-88252] N87-11800
A description of the active and passive sidewall-boundary-layer removal systems of the 0.3-meter transonic cryogenic tunnel
[NASA-TM-87764] N87-11801

TRANSPORT AIRCRAFT
Practical considerations in aeroelastic design N87-11720
Experiences performing conceptual design optimization of transport aircraft N87-11723
Multidisciplinary optimization applied to a transport aircraft N87-11746
Some experiences in aircraft aeroelastic design using Preliminary Aeroelastic Design of Structures (PAD) N87-11747

TRAPPING
A model for the liquid crystal light valve. Part 1: Analysis of charge trapping in the BSO and its effect on the device resolution
[BAE-BT-15603] N87-12376

TRAVELING WAVE TUBES
Development of Traveling Wave Tube (TWT) transmitter amplifier for communication satellites 60 GHz/10 W
[BMFT-FB-W-85-030] N87-11953

TREES (MATHEMATICS)
MENTOR user manual — editor
[INF-85-15] N87-12259
Tree grammars as a pattern matching mechanism for code generation
[TUM-I8524] N87-12279

TREES (PLANTS)
The stochastic modelling of trees N87-12201
Graphical applications of L-systems N87-12213

TRIANGULATION
Fast optimal orbit estimation from GPS measurements
[INPE-4016-NTE/263] N87-11817

TRIBOLOGY
Report on the dismantling and examination of Dornier System GmbH medium speed mechanism on completion of a seven year real-life test — satellite antennas, platforms
[ESA-ESTL-65] N87-11836
Calculation methods for steadily loaded axial groove hydrodynamic journal bearings. Low viscosity process fluid lubrication.
[ESDU-86006] N87-11991
Activities report in space tribology
[ESA-ESTL-77] N87-12005
TROPICAL METEOROLOGY
Atlas of the tropical and subtropical circulation derived from National Meteorological Center operational analyses
[PB86-206923] N87-12095
TROPICAL REGIONS
Monthly and seasonal climatology of the northern winter over the global tropics and subtropics for the period 1974 to 1983. Volume 4: 700
[AD-A169837] N87-12089
TROPOSPHERE
Development of data processing, interpretation and analysis system for remote sensing of trace atmospheric gas species
[NASA-CR-179882] N87-12059
Modification of a variational objective analysis model for new equations for pressure gradient and vertical velocity in the lower troposphere and for spatial resolution and accuracy of satellite data
[NASA-CR-4025] N87-12085
Atlas of the tropical and subtropical circulation derived from National Meteorological Center operational analyses
[PB86-206923] N87-12095
TRUSSES
Design, construction and utilization of a space station assembled from 5-meter erectable struts
[NASA-TM-89043] N87-11827
TUBE HEAT EXCHANGERS
Effectiveness: N sub TU relationships for the design and performance evaluation of two-stream heat exchangers
[ESDU-86018] N87-11959
TUNABLE LASERS
Combustion gas spectroscopy using tunable lasers
[DE86-012973] N87-11868
TUNING
Optimization of cascade blade mistuning under flutter and forced response constraints N87-11732
TURBINE BLADES
STAEBL: Structural tailoring of engine blades, phase 2 N87-11731
Optimization of cascade blade mistuning under flutter and forced response constraints N87-11732
On optimal design for the blade-root/hub interface in jet engines N87-11769
Fabrication of cooled radial turbine rotor
[NASA-CR-179503] N87-11789
Pressure and flow field measurements of axial turbine tip clearance flow in a linear cascade
[CUED/A-TURBO-TR-123] N87-11791
TURBINE ENGINES
Compound cycle engine program
[NASA-TM-88879] N87-11790
Aviation turbine fuels, 1985
[DE86-012140] N87-11908
TURBOCOMPRESSORS
Compound cycle engine program
[NASA-TM-88879] N87-11790
TURBOFAN ENGINES
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A168450] N87-11885
F100 fuel sampling analysis: Foreign samples
[AD-A168573] N87-11904
TURBOFANS
On sound propagation in centrifugal fan casings
[ESA-TT-967] N87-12326
TURBOPROP AIRCRAFT
Concentrated mass effects on the flutter of a composite advanced turboprop model
[NASA-TM-88854] N87-12017
Window acoustic study for advanced turboprop aircraft
[NASA-CR-172391] N87-12322
Lightweight sidewalls for aircraft interior noise control
[NASA-CR-172490] N87-12323
TURBOPROP ENGINES
Strategic plan, 1986
[NASA-TM-89263] N87-12384
TURBULENCE
User's manual for a TEACH computer program for the analysis of turbulent, swirling reacting flow in a research combustor
[NASA-CR-179547] N87-11868
TURBULENT BOUNDARY LAYER
Analysis of compressible boundary layer with real gas effects N87-11869
Improvement of mechanical model in the entrainment method for compressible turbulent boundary layer
[AD-A168451] N87-11970
TURBULENT FLOW
Application of viscous-inviscid interaction methods to transonic turbulent flows
[NASA-CR-179900] N87-11700
Simulations of turbulent mixing and reacting flows and their applications to turbulence modeling
[NASA-CR-179829] N87-11960
Third-moment closure of turbulence for predictions of separating and reattaching shear flows: A study of Reynolds-stress closure model
[NASA-CR-177055] N87-11961
Velocity measurements for turbulent nonseparated flow over solid waves
[AD-A168682] N87-11971
Preliminary turbulence length scale measurements in a motored IC engine
[DE86-008171] N87-11999
TURBULENT MIXING
Simulations of turbulent mixing and reacting flows and their applications to turbulence modeling
[NASA-CR-179829] N87-11960
TWO DIMENSIONAL BODIES
Recognition of two-dimensional shapes
[AD-A168403] N87-12250
TWO DIMENSIONAL BOUNDARY LAYER
Drag and pressure recovery characteristics of auxiliary air inlets at subsonic speeds
[ESDU-86002] N87-11892
TWO DIMENSIONAL FLOW
Acta Aerodynamica Sinica (selected articles)
[AD-A168449] N87-11884
Contribution to the analysis of high-lift airfoil aerodynamics
[AD-A168401] N87-11703
A viscous/inviscid zonal method for the computation of 2 and 3-dimensional compressible fluid flows with separation N87-11958
TWO PHASE FLOW
Effectiveness: N sub TU relationships for the design and performance evaluation of two-stream heat exchangers
[ESDU-86018] N87-11959
Asympotic solutions to compressible laminar boundary-layer solutions for dusty-gas flow over a semi-infinite flat plate
[UTIAS-310] N87-11967
TYPE 3 BURSTS
Relative timings of MM-waves and associated M-waves solar bursts
[INPE-4013-PRE/1004] N87-12525

U

U.S.S.R. SPACE PROGRAM
USSR report: Space
[JPRS-USP-86-005] N87-11809
Star City: On the 25th anniversary of the cosmonaut training center N87-11811
ULTRAHIGH FREQUENCIES
Rain effects on radio frequency propagation
[AD-A168342] N87-11920
ULTRASONIC FLAW DETECTION
Ultrasonic imaging and automated flaw detection system
[AD-A168195] N87-12011
ULTRASONIC SCANNERS
Capabilities of ultrasonic methods of evaluating hemodynamics of cardiocerebrovascular system N87-12126
ULTRASONIC TESTS
Ultrasonic imaging and automated flaw detection system
[AD-A168195] N87-12011
ULTRASONICS
Studies of strain rate effects in the deformation of solids by means of stress pulses and ultrasonic methods
[DE86-012208] N87-12025
ULTRAVIOLET ASTRONOMY
An XUV spectroscopic observation of the white dwarf star HZ 43 N87-12505
ULTRAVIOLET SPECTRA
An XUV spectroscopic observation of the white dwarf star HZ 43 N87-12505
ULTRAVIOLET SPECTROSCOPY
Stellar observations with the Voyager EUV objective grating spectrograph N87-12484
UNDERWATER TESTS
Lift and drag measurements on a towing tank model of a tip vane turbine
[IW-R512] N87-11980
Verifying strain gage installations for dynamic tests
[DE86-006469] N87-11985
UNDERWATER TO SURFACE MISSILES
State-space analysis of the Trident 2 mark 6 gyro
[AD-A168404] N87-11921
UNITED STATES
Federal government information technology: Management, security and congressional oversight
[PB86-205499] N87-12397
UNIVERSITIES
Methodological approach to the 1984 new entrants survey
[PB86-212305] N87-12393
UNIVERSITY PROGRAM
Academic science/engineering: R and D funds, fiscal year 1984 (detailed statistical tables)
[PB86-216017] N87-12382
UNSTEADY FLOW
Bifurcations in unsteady aerodynamics
[NASA-TM-88316] N87-11697
URANUS (PLANET)
Portable high speed photometry systems for observing occultations N87-12416
Ground-based studies of Jupiter, Uranus, and Neptune in support of the Galileo and Voyager missions N87-12434
Planetary Fabry-Perot spectroscopy N87-12437
Visible phase curves of Uranus and Neptune and scattering in their atmospheres N87-12438
URANUS SATELLITES
Search for volatiles in the surface of icy satellites N87-12414
URBAN DEVELOPMENT
Making appropriations for the Department of Housing and Urban Development and for sundry independent agencies, boards, commissions, corporations and offices for the fiscal year ending September 30, 1987
[GPO-64-330] N87-12401
USER MANUALS (COMPUTER PROGRAMS)
User's manual for a TEACH computer program for the analysis of turbulent, swirling reacting flow in a research combustor
[NASA-CR-179547] N87-11868
Pulse Code Modulation (PCM) encoder handbook for Aydin Vector MMP-600 series system
[NASA-RP-1171] N87-11916
User manual for BUNVIS-RG: An exact buckling and vibration program for lattice structures, with repetitive geometry and substructuring options
[NASA-TM-87669] N87-12016
MENTOR user manual — editor
[INF-85-15] N87-12259
A user's guide to the socioeconomic environmental demographic information system (SEEDIS)
[AD-A168917] N87-12388

V

VACUUM TESTS
Performance limits of surface-hardened aluminum-alloy gears in vacuum
[ESA-ESTL-059] N87-11884
VAPOR DEPOSITION
Interfacial properties of germanium nitride dielectric layers in germanium
[AD-A168332] N87-12362
VAPOR PHASE EPITAXY
Research on mercury cadmium telluride
[AD-A170477] N87-12371
VARIABLE STARS
Multiwavelength studies of Cygnus X-3 N87-12502
VARIANCE (STATISTICS)
Modification of a variational objective analysis model for new equations for pressure gradient and vertical velocity in the lower troposphere and for spatial resolution and accuracy of satellite data
[NASA-CR-4025] N87-12085
VARIATIONAL PRINCIPLES
Structural optimization with constraints on transients response N87-11767
The 1915 epistolary controversy between A. Einstein and T. Levi-Civita
[PREPRINT-472] N87-12380
VARIATIONS
Spectral distribution and variation of solar radiation
[DE86-012148] N87-12076
VASODILATION
Slowly-developing modifications in cutaneous circulatory control
[AD-A168702] N87-12152
VECTOR ANALYSIS
On the use of ridge and Stein-type estimators in prediction
[AD-A168349] N87-12302

VECTOR MESONS
Precision tests of the electroweak theory at the Z deg. — boson
[PREPRINT-464] N87-12332
VEGA PROJECT
TASS reports VEGAS-1 encounter with Halley's Comet N87-11812
Balloon probe and descent apparatus exploration of Venus discussed N87-11813
VELOCITY MEASUREMENT
Velocity measurements for turbulent nonseparated flow over solid waves
[AD-A168682] N87-11971
Laser based information systems (selected pages)
[AD-A168418] N87-11968
VENUS (PLANET)
Balloon probe and descent apparatus exploration of Venus discussed N87-11813
The Arecibo S-band radar program N87-12408
VENUS ATMOSPHERE
Balloon probe and descent apparatus exploration of Venus discussed N87-11813
VERTICAL ORIENTATION
HF (High Frequency) absolute time of arrival sensing
[AD-A168275] N87-11917
VERTICAL TAKEOFF AIRCRAFT
Aircraft automatic-flight-control system with inversion of the model in the feed-forward path using a Newton-Raphson technique for the inversion
[NASA-TM-88209] N87-11796
The 8 m x 6 m low speed wind tunnel at the Chinese Aerodynamic Research and Development Center
[AD-A168448] N87-11803
VERY LARGE SCALE INTEGRATION
Proposition of a design methodology for integrated communication circuits. Implementation of a circuit for the FIP local network
[ETN-86-98399] N87-11934
VLSI (Very Large Scale Integrated circuits) implementation of a quantized sinusoid filter algorithm and its use to compute the discrete Fourier transform, part 2
[AD-A168605] N87-11942
VESTA ASTEROID
Passive microwave remote sensing of the asteroids using the VLA: Continuation N87-12476
VIBRATION
Surface vibrations and (2x1) superstructures on FCC(110) metal surfaces
[AD-A168788] N87-12367
VIBRATION DAMPING
Application of modern structural optimization to vibration reduction in rotorcraft N87-11752
Qualitative results for distributed systems with discrete and stiffness with application to control
[AD-A168622] N87-11829
Numerical study of the damping of acoustic waves in a duct with splitter plates
[MPIS-20/1985] N87-12324
VIBRATION EFFECTS
Investigation of viability of quail embryos and chicks when eggs are exposed to gamma radiation and vibration as related to different terms of egg storage N87-12119
VIBRATIONAL STRESS
Effect of vibration amplitude on vapor cavitation in journal bearings
[NASA-TM-88826] N87-11962
VIDEO EQUIPMENT
Reliable welding of HSLA steels by square wave pulsing using an advanced sensing (EDAP) technique
[AD-A168762] N87-11997
Observation with video equipment in the wavelength range 1.2 to 2.0 micrometer
[FOA-C-30417-E1] N87-12347
VIDEO SIGNALS
Hand off integrator apparatus for signal detection
[AD-D012391] N87-11926
VIDICONS
Observation with video equipment in the wavelength range 1.2 to 2.0 micrometer
[FOA-C-30417-E1] N87-12347
VISCOSITY
Measurement and prediction of liquid mixture thermal conductivity and viscosity
[DE86-012508] N87-11977
VISCOUS FLOW
A viscous/inviscid zonal method for the computation of 2 and 3-dimensional compressible fluid flows with separation N87-11958
Velocity measurements for turbulent nonseparated flow over solid waves
[AD-A168682] N87-11971
VISIBILITY
Profiling graphic display systems N87-12183
VISIBLE SPECTRUM
Analyses of the atmospheric aerosol extinction in the 0.5 to 14 micron region
[FOA-C-30396-E1,E3] N87-12091
Optical spectroscopic studies of Wolf-Rayet carbon and oxygen stars N87-12504
VISION
Temporal tuning effects in the visually evoked response
[AD-A168219] N87-12149
Cortical representation of texture primitives N87-12227
VISUAL ACUITY
Ocular hazards associated with laser exposure
[AD-A168506] N87-12151
Development of vision tests for air-to-air target detection
[AD-A168309] N87-12161
VISUAL DISCRIMINATION
Cortical representation of texture primitives N87-12227
Three processing characteristics of texture discrimination N87-12230
VISUAL FLIGHT
Evaluation of a visual system in its support of simulated helicopter flight
[AD-A168829] N87-11783
Number and duration of Runway Visual Range (RVR) runs for RVR-values lower than 225 m
[KNMI-TR-85(FM)] N87-11805
VISUAL OBSERVATION
Distinctions of visual monitoring of instrument readings in maneuvered flight N87-12125
VISUAL PERCEPTION
Evaluation of a visual system in its support of simulated helicopter flight
[AD-A168829] N87-11783
Number and duration of Runway Visual Range (RVR) runs for RVR-values lower than 225 m
[KNMI-TR-85(FM)] N87-11805
Image analysis, perception strategy and cognitive strategy — microscopy images of biological cells
[ETN-86-98401] N87-12104
Visual-optical assessment of thresholds of object distortion due to lens defects in flat glass of vehicle cabins N87-12131
Temporal tuning effects in the visually evoked response
[AD-A168219] N87-12149
Speeded phase discrimination: Evidence for global to local processing N87-12228
The extraction of knowledge from data: An evaluation of Intelligent Knowledge Based Systems (IKBS) — image processing
[BAE-BT-15035] N87-12276
VISUAL STIMULI
Temporal tuning effects in the visually evoked response
[AD-A168219] N87-12149
VLASOV EQUATIONS
Stationary solutions of the Vlasov-Fokker-Planck equation — plasma equilibrium
[PREPRINT-104] N87-12294
VORTEX BREAKDOWN
Vortex flap technology: A stability and control assessment
[NASA-CR-172439] N87-11795
VORTEX FILAMENTS
Quantized vortex filaments in incompressible fluids
[DE86-011249] N87-11974
VORTEX FLAPS
Vortex flap technology: A stability and control assessment
[NASA-CR-172439] N87-11795
VORTEX SHEDDING
Vortex shedding of a square cylinder in front of a slender airfoil at high Reynolds numbers. Part 2: Compressibility effect
[MPIS-24/1985] N87-11704
VORTICES
Normal force, pitching moment and side force of axisymmetric forebody-cylinder combinations for angles of attack up to 90 degrees and Mach numbers up to 1.2
[ESDU-86009] N87-11690
PIAS: A program for an iterative aeroelastic solution N87-11725
Applications of CONMIN to wing design optimization with vortex flow effect N87-11737
The prediction of transonic loading advancing helicopter rotors
[AD-A168217] N87-11781
Velocity measurements for turbulent nonseparated flow over solid waves
[AD-A168682] N87-11971
VORTICITY EQUATIONS
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A168450] N87-11686
VOYAGER 1 SPACECRAFT
Voyager microwave scintillation measurements of solar wind plasma parameters N87-12526
VOYAGER 2 SPACECRAFT
Voyager microwave scintillation measurements of solar wind plasma parameters N87-12526

W

WAKES
The prediction of transonic loading advancing helicopter rotors
[AD-A168217] N87-11781
WALLS
The discrete site sticky wall model
[AD-A168910] N87-12370
WALSH FUNCTION
A complex extension of the Hadamard transform for correlation purposes — scene correlation with matched filters
[BAE-BT-14469] N87-12292
WATER
The representation of water N87-12209
WATER IMMERSION
Verifying strain gage installations for dynamic tests
[DE86-006469] N87-11985
WATER QUALITY
Organics in water contamination analyzer, phase 1
[NASA-CR-179901] N87-12060
WATER RECLAMATION
Reclamation of water used for washing by means of reverse osmosis during long-term spaceflights N87-12120
WATER TREATMENT
Reclamation of water used for washing by means of reverse osmosis during long-term spaceflights N87-12120
WATER WAVES
Pacific Coast hindcast deepwater wave information
[AD-A168511] N87-12098
Solutions in straits of varying width and depth
[PREPRINT-485] N87-12101
Evaluation of wave calculations using GONO in the period October 1984 - April 1985
[KNMI-TR-79] N87-12102
WAVE DIFFRACTION
A numerical study of diffraction in reentrant geologic structure
[AD-A168562] N87-12072
WAVE DISPERSION
Geometric structure, pseudo band gaps, and surface vibrational resonances on metal surfaces
[AD-A168291] N87-11878
WAVE GENERATION
Solutions in straits of varying width and depth
[PREPRINT-485] N87-12101
Millimeter wave generation by relativistic electron beams
[AD-A168624] N87-12352
WAVE INTERACTION
Microwave emission and scattering from Earth surface and atmosphere
[NASA-CR-177189] N87-12068
Optical phase conjugation via four-wave mixing in barium titanate
[AD-A168908] N87-12341
WAVE PROPAGATION
EHF (Extremely High Frequency) telecommunications system engineering model
[PB86-214814] N87-11937
Microwave emission and scattering from Earth surface and atmosphere
[NASA-CR-177189] N87-12068
Nonlinear internal gravity wave propagation, saturation and absorption in the atmosphere
[AD-A170244] N87-12074
Solutions in straits of varying width and depth
[PREPRINT-485] N87-12101
Numerical study of the damping of acoustic waves in a duct with splitter plates
[MPIS-20/1985] N87-12324
WEAK INTERACTIONS (FIELD THEORY)
Precision tests of the electroweak theory at the Z deg. — boson
[PREPRINT-464] N87-12332
WEAPON SYSTEMS
Control of radio frequency interference in high frequency switched mode power supplies — weapon systems
[BAE-BT-15600] N87-11929

WEAR
Technology development for small high speed, mainshaft roller bearings
[AD-A166664] N87-11996
WEAR RESISTANCE
Effect of laser hardening on microstructure and wear resistance in medium carbon/chromium steels
[DE86-012021] N87-11880
WEATHER FORECASTING
Conceptual design of a synoptic interplanetary monitor platform at L sub 1 (SIMPL)
[AD-A166522] N87-11828
NOAA (National Oceanic and Atmospheric Administration) N-ROSS/ERS-1 Environmental Data Development (NNEEDD) products and services
[PB86-213527] N87-11836
Environmental processes and spectral reflectance characteristics associated with soil erosion in desert fringe regions
[NASA-CR-179729] N87-12036
Equatorial Pacific Ocean Climate Studies (EPOCS): Progress and plans
[PB86-213493] N87-12092
Mariners Weather Log, volume 30, number 2, spring 1986
[PB86-213360] N87-12093
The direct and indirect effects of latent heat release on extratropical cyclone development N87-12097
WEATHERING
Derivation of damage functions for atmospheric degradation of materials
[PB86-213238] N87-11911
WEAVING
Some implications of dynamic structural analysis N87-12176
WEBS (SUPPORTS)
Performance and design of composite beams with web openings
[PB86-213105] N87-12027
WEIGHT REDUCTION
The structural optimization of a spreader bar for twin lift helicopter operations N87-11759
WEIGHTLESSNESS
USSR report: Space Biology and Aerospace Medicine, Vol. 20, No. 2, March - April 1986
[JPRS-USB-86-004] N87-12105
Preliminary results of medical investigations during 5-month spaceflight aboard Salyut-7-Soyuz-T orbital complex N87-12109
Professional work capacity and functional state of operator exposed to repeated optokinetic and antiorthostatic factors N87-12110
Venous pressure in jugular vein system and effectiveness of blood return to right heart during 120-day head-down tilt N87-12111
Human heart function in early hours and days of head-down tilt (echocardiographic data) N87-12112
Human blood free amino acids at early stage of head-down tilt N87-12113
Blood serum enzyme activity in healthy man with simulation of effects of weightlessness N87-12114
Paramecium test for toxic substances in human blood during simulated weightlessness N87-12115
Typological characteristics of central hemodynamics of monkeys in clinostatic and orthostatic positions N87-12116
Behavioral reactions of animals exposed to spaceflight conditions in the prenatal period N87-12138
Effect of weightlessness on rat fetus skeletal development N87-12139
In vivo nuclear magnetic resonance imaging
[NASA-CR-179902] N87-12328
WELDED JOINTS
Inertial welding of 1100 aluminum to type 316 stainless steel
[DE86-009145] N87-11998
WELDING
Inertial welding of 1100 aluminum to type 316 stainless steel
[DE86-009145] N87-11998
Joining methods for beryllium: A survey
[DE86-012000] N87-12002
WELLS
Tunneling in one dimension: General theory, instabilities, rules of calculation, applications — quantum mechanics
[PREPRINT-475] N87-12374
WHISKER COMPOSITES
Dispersion and blending of SiC (silicon carbide) whiskers in RSP aluminum powders
[AD-A166836] N87-11849
WHITE DWARF STARS
An XUV spectroscopic observation of the white dwarf star HZ 43 N87-12505
The emission lines from accretion disks in cataclysmic variable systems N87-12513
WIND (METEOROLOGY)
Comments on gust response constrained optimization N87-11774
Mathematical and statistical analysis
[AD-A169277] N87-11830
WIND MEASUREMENT
Wind profiling of stormy and quiescent atmospheres with microwave radars
[PB86-212545] N87-12094
WIND PROFILES
Wind profiling of stormy and quiescent atmospheres with microwave radars
[PB86-212545] N87-12094
WIND SHEAR
Clear air turbulence analysis using isentropic methods
[AD-A168400] N87-12088
WIND TUNNEL TESTS
Acta Aerodynamica Sinica (selected articles)
[AD-A168449] N87-11684
An experimental study of the aerodynamics of a NACA 0012 airfoil with a simulated glaze ice accretion
[NASA-CR-179697] N87-11701
Calculated effects of varying Reynolds Number and dynamic pressure on flexible wings at transonic speeds N87-11738
Pressure and flow field measurements of axial turbine tip clearance flow in a linear cascade
[CUED/A-TURBO-TR-123] N87-11791
Vortex flap technology: A stability and control assessment
[NASA-CR-172439] N87-11795
Methods for assessing wall interference in the 2- by 2-foot adaptive-wall wind tunnel
[NASA-TM-88252] N87-11800
A description of the active and passive sidewall-boundary-layer removal systems of the 0.3-meter transonic cryogenic tunnel
[NASA-TM-87764] N87-11801
The 8 m x 6 m low speed wind tunnel at the Chinese Aerodynamic Research and Development Center
[AD-A168448] N87-11803
WIND TUNNEL WALLS
Methods for assessing wall interference in the 2- by 2-foot adaptive-wall wind tunnel
[NASA-TM-88252] N87-11800
A description of the active and passive sidewall-boundary-layer removal systems of the 0.3-meter transonic cryogenic tunnel
[NASA-TM-87764] N87-11801
WIND TUNNELS
Strategic plan, 1985
[NASA-TM-89263] N87-12384
WIND TURBINES
Lift and drag measurements on a towing tank model of a tip vane turbine
[IW-R512] N87-11980
WEST-3 wind turbine simulator development
[NASA-CR-174983] N87-12046
Survey of partial reports on the investigation of tip vanes
[IW-R514] N87-12057
Progress in calculation methods for eigenfrequencies
[IW-M505] N87-12058
WIND VELOCITY
Application of satellite data to the variational analysis of the three dimensional wind field
[NASA-CR-4022] N87-12084
Clear air turbulence analysis using isentropic methods
[AD-A168400] N87-12088
Monthly and seasonal climatology of the northern winter over the global tropics and subtropics for the period 1974 to 1983. Volume 4: 700
[AD-A168837] N87-12089
WIND VELOCITY MEASUREMENT
Sodar, rawinsonde and surface layer measurements at a coastal site. Part 2: SCCCAMP (South Central Coast Aerometric Monitoring Project) data report
[AD-A168833] N87-12073
WINDMILLS (WINDPOWERED MACHINES)
Control of wind power stations with variable velocity in a large range
[FOA-C-20613-E3] N87-12056
WINDOWS (APERTURES)
Techniques for microwave dielectric measurements
[AD-A168300] N87-11919
Window acoustic study for advanced turboprop aircraft
[NASA-CR-172391] N87-12322
WINDPOWER UTILIZATION
Survey of partial reports on the investigation of tip vanes
[IW-R514] N87-12057
WINDPOWERED GENERATORS
Control of wind power stations with variable velocity in a large range
[FOA-C-20613-E3] N87-12056
Survey of partial reports on the investigation of tip vanes
[IW-R514] N87-12057
WINDSHIELDS
Visual-optical assessment of thresholds of object distortion due to lens defects in flat glass of vehicle cabins N87-12131
WING LOADING
The prediction of transonic loading advancing helicopter rotors
[AD-A168217] N87-11781
WING OSCILLATIONS
Acta Aerodynamica Sinica (selected articles)
[AD-A168449] N87-11684
WING TIP VORTICES
Tip vortices of wings in subsonic and transonic flow: A numerical simulation
[NASA-TM-88334] N87-11699
WINGS
Optimal redesign study of the harm wing N87-11734
Calculated effects of varying Reynolds Number and dynamic pressure on flexible wings at transonic speeds N87-11738
Multidisciplinary optimization applied to a transport aircraft N87-11748
WINTER
Investigation on acidity-forming ions in wet and dry deposition during the winter season 1984/85
[DFVLR-FB-86-16] N87-12062
WIRE
National Transportation Safety Board safety recommendation N87-11706
WIRING
A multilayer channel router for nonrectangular channels — wiring
[INF-86-9] N87-11957
WOLF-RAYET STARS
Optical spectroscopic studies of Wolf-Rayet carbon and oxygen stars N87-12504
WORDS (LANGUAGE)
Optical character recognition of touching characters N87-12239
WORK CAPACITY
Forecasting operator work capacity during long-term continuous work N87-12128
WORKLOADS (PSYCHOPHYSIOLOGY)
USSR report: Space Biology and Aerospace Medicine, vol. 20, no. 4, July - August 1986
[JPRS-USB-86-006] N87-12124
Forecasting operator work capacity during long-term continuous work N87-12128
Biochemical indicators of emotional stress in air traffic controllers N87-12129
Register of research in progress on mental workload
[AD-A168210] N87-12160
The space station: Human factors and productivity
[NASA-CR-179905] N87-12166
WORKSTATIONS
A cel-based model for paint systems N87-12189
Graphics tools in Adagio, a robotics multitasking multiprocessor workstation N87-12191

X

X RAY ASTRONOMY
Variability studies of 3C 371 — extragalactic radio sources
[NASA-CR-179772] N87-12406
High energy neutrino emission from binary X-ray sources
[PREPRINT-471] N87-12529
X RAY IMAGERY
X-ray and radio images of four supernova remnants with three distinct X-ray signatures N87-12503
X RAY LASERS
SDI (Strategic Defense Initiative) Program: Evaluation of DOE's (Department of Energy's) answers to questions on X-ray laser experiment, briefing report
[PB86-209238] N87-11808
X RAY SOURCES
X-ray and radio images of four supernova remnants with three distinct X-ray signatures N87-12503
The physical characteristics of the X-ray emitting gas in clusters of galaxies and constraints on dark matter N87-12514
X RAY SPECTRA
Variability studies of 3C 371 — extragalactic radio sources
[NASA-CR-179772] N87-12406
X RAY STARS
Multiwavelength studies of Cygnus X-3 N87-12502
X RAYS
Solar flare X-ray polarimetry
[NASA-CR-179899] N87-12523

Y

YIELD POINT
Shape design sensitivity analysis of built-up structures
N87-11745

Z

ZINC SULFIDES
Optimization of p-CuInSe sub 2/n-CdZnS solar cells
[DE86-010700] N87-12052
ZINC TELLURIDES
Zone leveling and solution growth of complex compound semiconductors in space
[NASA-CR-179884] N87-12356
ZONAL HARMONICS
Tip vortices of wings in subsonic and transonic flow: A numerical simulation
[NASA-TM-88334] N87-11699

Typical Corporate Source Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The NASA accession number denotes the number by which the citation is identified. The titles are arranged under each corporate source in ascending accession number order.

A

ACUREX CORP., MOUNTAIN VIEW, CALIF.
Catalytic combustion component and system prototype development
[PB86-211380] N87-11869
AEG-TELEFUNKEN, ULM (WEST GERMANY).
Development of Traveling Wave Tube (TWT) transmitter amplifier for communication satellites 60 GHz/10 W
[BMFT-FB-W-85-030] N87-11953
AERONAUTICAL RESEARCH LABS., MELBOURNE (AUSTRALIA).
An automatic crack measuring system using the direct-current potential-difference method
[ARL-STRUC-R-419] N87-11982
Optimal sampling rates for auto regressive models
[AD-A168740] N87-12298
AEROSPACE CORP., EL SEGUNDO, CALIF.
Submicrometer resolution etching of integrated circuit materials with laser-generated atomic fluorine
[ATR-85(8347)-1] N87-11939
AEROSPACE MEDICAL RESEARCH LABS., WRIGHT-PATTERSON AFB, OHIO.
Register of research in progress on mental workload
[AD-A168210] N87-12160
ALIAS RESARCH CORP., TORONTO (ONTARIO).
Profiling graphic display systems N87-12183
AIR COMMAND AND STAFF COLL., MAXWELL AFB, ALA.
Space activities of western Europe
[AD-A168424] N87-11807
Using optical disk as the storage media device for the master personnel files
[AD-A168390] N87-12387
AIR FORCE GEOPHYSICS LAB., HANSCOM AFB, MASS.
World atlas of total sky-cover: Environmental research papers
[AD-A170474] N87-12090
AIR FORCE SYSTEMS COMMAND, WRIGHT-PATTERSON AFB, OHIO.
Acta Aerodynamica Sinica (selected articles)
[AD-A168449] N87-11884
Acta Aeronautica et Astronautica Sinica (selected articles)
[AD-A168450] N87-11885
The 6 m x 6 m low speed wind tunnel at the Chinese Aerodynamic Research and Development Center
[AD-A168448] N87-11803
Studies on the dynamic mechanical properties of the composite modified double-base propellant
[AD-A168799] N87-11907
Improvement of mechanical model in the entrainment method for compressible turbulent boundary layer
[AD-A168451] N87-11970
Laser based information systems (selected pages)
[AD-A168418] N87-11988
Preparation and investigation of amorphous gallium arsenide films
[AD-A168907] N87-12369
AIR FORCE WRIGHT AERONAUTICAL LABS., WRIGHT-PATTERSON AFB, OHIO.
Improvement in ductility and fracture toughness of HIP'd and isothermally forged Ti-6Al-6V-2Sn powder with heat treatment
[AD-A168804] N87-11878
F100 fuel sampling analysis: Foreign samples
[AD-A168579] N87-11904
A network architecture for data-driven systems
[AD-A168764] N87-12267
Simplified design equations for an optical quarter-wave stack reflection filter
[AD-A168442] N87-12340
ALABAMA UNIV., HUNTSVILLE.
New experiments to constrain the coefficients of the Robertson transformations for inertial systems
[NASA-CR-179906] N87-12320
ALABAMA UNIV., UNIVERSITY.
Eigenvalue assignment strategies in rotor systems
[NASA-CR-179906] N87-12282
ALBERTA UNIV., EDMONTON.
Automatic generation of graphical user interfaces
N87-12187
Near-real-time control of human figure models
N87-12196
Connected component labeling using modified linear quadtrees N87-12211
A file organization scheme for polygon data
N87-12221
Three processing characteristics of texture discrimination N87-12230
Edge-only matching techniques in robot vision
N87-12232
AMAX MATERIALS RESEARCH CENTER, ANN ARBOR, MICH.
Carburizing steel for high temperature service
[AD-A168327] N87-11877
AMES LAB., IOWA.
Density of states at mid gap in hydrogenated amorphous silicon
[DE86-011403] N87-12373
APPLIED FUSION TECHNOLOGIES, INC., FORT COLLINS, COLO.
Reliable welding of HSLA steels by square wave pulsing using an advanced sensing (EDAP) technique
[AD-A168782] N87-11987
ARGONNE NATIONAL LAB., ILL.
Electrochemical effects on weld pool chemistry in submerged arc and dc electroslag welding
[DE86-012117] N87-12003
National Energy Software Center
[DE86-010515] N87-12391
ARINC RESEARCH CORP., ANNAPOLIS, MD.
Ground aircraft deicing technology review
[DOT/FAA/CT-85/21] N87-11707
ARIZONA STATE UNIV., TEMPE.
Electromagnetic backscattering by corner reflectors
[NASA-CR-179846] N87-11913
Electromagnetic backscattering by corner reflectors
[NASA-CR-179809] N87-11914
Spectroscopy of comets N87-12478
International Halley Watch: Discipline specialists for spectroscopy and spectrophotometry N87-12496
ARIZONA UNIV., TUCSON.
Radon optical processing in radon space
[AD-A169612] N87-11943
DFR (Decreasing Failure Rate) property of first passage times and its preservation under geometric compounding
[AD-A168671] N87-12304
Large optics technology
[AD-A168222] N87-12339
Interiors of the giant planets N87-12420
Studies of extended planetary atmospheres
N87-12421
Speckle interferometry applied to asteroids and other solar system objects N87-12449
Planetary spectroscopy N87-12450
Photometry of small asteroids and cometary cores
N87-12451
CCD scanning for asteroids and comets N87-12452
Cometary spectroscopy N87-12458
Infrared observations of planets N87-12459
Pole orientation, sidereal period, and sense of rotation of asteroids N87-12473
Stellar observations with the Voyager EUV objective grating spectrograph N87-12484
The radial velocity search for extrasolar planets
N87-12485
International Halley Watch: Discipline specialists for near-nucleus studies N87-12495
ARMY ARMAMENT, MUNITIONS AND CHEMICAL COMMAND, ABERDEEN PROVING GROUND, MD.
Methods for calculating the probability distribution of sums of independent random variables
[AD-A170465] N87-12309
ARMY ARMAMENT MUNITIONS AND CHEMICAL COMMAND, DOVER, N.J.
System safety procedures for nondevelopment item (NDI) acquisitions
[AD-A168353] N87-12012
ARMY ARMAMENT RESEARCH AND DEVELOPMENT COMMAND, DOVER, N. J.
High performance liquid chromatography of propellants. Part 1: Analysis of M1, M6, and M10 propellants
[AD-A168206] N87-11903
ARMY CLOSE COMBAT ARMAMENTS CENTER, WATERVLIET, N.Y.
The elastic constants of Ni3Al to 1.4 GPa
[AD-A168813] N87-11879
A thin cylinder problem
[AD-A168665] N87-12251
ARMY ENGINEER TOPOGRAPHIC LABS., FORT BELVOIR, VA.
Techniques to improve astronomic positioning in the field
[AD-A168347] N87-12042
Cumulative probability tables for testing consensus in ranking experiments
[AD-A168378] N87-12303
ARMY ENGINEER WATERWAYS EXPERIMENT STATION, VICKSBURG, MISS.
Advanced construction procedures: Confined bases for airport pavements
[FAA/PM-86/9] N87-11799
ARMY MATERIALS TECHNOLOGY LAB., WATERTOWN, MASS.
Statistical strength comparison of metal matrix and polymeric matrix composites
[AD-A168847] N87-11880
ARMY RESEARCH AND TECHNOLOGY LABS., FORT EUSTIS, VA.
Application of numerical optimization to rotor aerodynamic design N87-11757
Aeroelastic-aerodynamic optimization of high speed helicopter-compound rotor N87-11758
ARMY RESEARCH INST. OF ENVIRONMENTAL MEDICINE, NATICK, MASS.
Slowly-developing modifications in cutaneous circulatory control
[AD-A168702] N87-12152
Human exercise and heat exchange in thermal environments
[AD-A168746] N87-12154
ATLANTIC RESEARCH CORP., GAINESVILLE, VA.
Expendable epoxy application
[AD-A168669] N87-11995
ATMOSPHERIC AND ENVIRONMENTAL RESEARCH, INC., CAMBRIDGE, MASS.
Extended atmospheres of outer planet satellites and comets
[NASA-CR-179888] N87-12519
ATMOSPHERIC SCIENCE ASSOCIATES, BEDFORD, MASS.
Calculation of water drop trajectories to and about arbitrary three-dimensional lifting and nonlifting bodies in potential airflow
[NASA-CR-3935] N87-11894

SOURCE

B

BAJ VICKERS LTD., BANWELL WESTON-SUPER-MARE (ENGLAND).
Correlation of fracture toughness and Charpy impact test results
[TR1089] N87-12018
BALLISTIC RESEARCH LABS., ABERDEEN PROVING GROUND, MD.
Lifetimes and quenching of the B state of PO by atmospheric gases
[AD-A166736] N87-11860
Calculation of potential energy surfaces for HCO and HNO using many-body methods

Application of program POISSON to axially-symmetric problems - magnetostatic and electrostatic - with use of a prolate spheroidal boundary
[DE86-012826] N87-12256
A user's guide to the socioeconomic environmental demographic information system (SEEDIS)
[AD-A169917] N87-12369
CALIFORNIA UNIV., DAVIS.
Fundamental study of dense-fluid detonation
[AD-A166753] N87-11906
CALIFORNIA UNIV., IRVINE.
Solar flare X-ray polarimetry
[NASA-CR-179899] N87-12523
CALIFORNIA UNIV., LOS ANGELES.
Structural synthesis: Precursor and catalyst N87-11718
Application of modern structural optimization to vibration reduction in rotorcraft N87-11752
A photometric investigation of the rich supercluster fourteen fifty-one plus twenty-two N87-12507
CALIFORNIA UNIV., SAN DIEGO.
Research on materials and components for opto-electronic signal processing
[AD-A166751] N87-12365
CALIFORNIA UNIV., SAN DIEGO, LA JOLLA.
Interfacial properties of germanium nitride dielectric layers in germanium
[AD-A166332] N87-12362
CALIFORNIA UNIV., SANTA BARBARA.
National Forum on the Future of Automated Materials Processing in US Industry: The Role of Sensors. Report of a workshop (1st) held at Santa Barbara, California on December 16-17, 1985
[PB86-212040] N87-11912
Free convection heat transfer in the critical region of binary fluid mixtures
[DE86-008868] N87-11978
Research on semiconductor heterostructures
[AD-A166367] N87-12368
CALIFORNIA UNIV., SANTA CRUZ.
VIRYA: A motion control editor for kinematic and dynamic animation N87-12197
CAMBRIDGE UNIV. (ENGLAND).
Pressure and flow field measurements of axial turbine tip clearance flow in a linear cascade
[CUED/A-TURBO-TR-123] N87-11791
CANADA CENTRE FOR REMOTE SENSING, OTTAWA (ONTARIO).
Integration of remotely sensed data and geographic information systems N87-12218
Map/image congruency evaluation knowledge based system N87-12219
CANADIAN INFORMATION PROCESSING SOCIETY, TORONTO (ONTARIO).
Graphics Interface 1986: Proceedings
[ISBN-0713-5434] N87-12175
CARNEGIE INSTITUTION OF WASHINGTON, D. C.
Chromospheric activity of cool giant stars
[NASA-CR-177184] N87-12510
CATHOLIC UNIV. OF AMERICA, WASHINGTON, D.C.
Active control of robot manipulator compliance
[NASA-CR-177183] N87-11994
CENTRE DE RECHERCHES SCIENTIFIQUES ET TECHNIQUES DE L'INDUSTRIE DES FABRICATIONS METALLIQUES, BRUSSELS (BELGIUM).
Activities report in metal structures industry scientific and technical studies
[ISBN-0624-7705] N87-11986
CENTRE NATIONAL D'ETUDES SPATIALES, TOULOUSE (FRANCE).
Principle of visual color coding applied to satellite imagery N87-12220
COASTAL ENGINEERING RESEARCH CENTER, VICKSBURG, MISS.
An annotated bibliography of the Atlantic Remote Sensing Land-Ocean Experiment (ARSLOE)
[AD-A168703] N87-12043
Pacific Coast hindcast deepwater wave information
[AD-A169511] N87-12098
COLLEGE OF WILLIAM AND MARY, HAMPTON, VA.
HALOE science investigation
[NASA-CR-179825] N87-11857
COLORADO SCHOOL OF MINES, GOLDEN.
Modeling of infiltration kinetics and interfacial bond strength in aluminum matrix-silicon carbide composites
[AD-A170480] N87-11893
Electrochemical effects on weld pool chemistry in submerged arc and dc electroslag welding
[DE86-012117] N87-12003
COLORADO UNIV., BOULDER.
Optical spectroscopic studies of Wolf-Rayet carbon and oxygen stars N87-12504
Large-scale structure and dynamics of solar active regions observed in the far ultraviolet N87-12527
COMMITTEE OF CONFERENCE (U. S. CONGRESS).
Making appropriations for the Department of Housing and Urban Development and for sundry independent agencies, boards, commissions, corporations and offices for the fiscal year ending September 30, 1987
[GPO-84-330] N87-12401
COMMITTEE ON COMMERCE, SCIENCE, AND TRANSPORTATION (U. S. SENATE).
Authorization of appropriations for the National Aeronautics and Space Administration for Fiscal Year 1987
[S-REPT-99-801] N87-12400
COMMITTEE ON SCIENCE AND TECHNOLOGY (U. S. HOUSE).
Delta launch vehicle accident investigation
[GPO-83-141] N87-11820
Strategy for safely returning space shuttle to flight status
[GPO-83-144] N87-11823
Investigation of the Challenger accident
[H-REPT-99-1016] N87-11824
Hearings before the Subcommittee on Space Science and Applications of the Committee on Science and Technology, 99th Congress, 2nd Session, No. 132, 25, 27 February; 11, 13, 20 March; 9, 10 April, 1986, Volume 2
[GPO-61-777] N87-12402

COMMUNICATIONS RESEARCH CENTRE, OTTAWA (ONTARIO).
Optical character recognition of touching characters
N87-12239
COMPUTER SCIENCES CORP., HAMPTON, VA.
SMP: A solid modeling program version 2.0
[NASA-CR-178169] N87-12244
CONNECTICUT UNIV., STORRS.
Development/Applications of FT-IR ATR (Fourier Transform IR Attenuated Total Internal Reflection) and photoacoustic dichroism techniques for structural characterization of polymer surfaces
[AD-A169519] N87-11894
A class of stable transmission algorithms for varying user models
[AD-A168701] N87-11923
CORNELL UNIV., ITHACA, N.Y.
Geometric structure, pseudo band gaps, and surface vibrational resonances on metal surfaces
[AD-A168291] N87-11876
Thematic mapper study of Alaskan ophiolites
[NASA-CR-179729] N87-12035
Surface vibrations and (2x1) superstructures on FCC(110) metal surfaces
[AD-A168788] N87-12367
Galaxy groups: Neutral hydrogen and dynamics
N87-12512
Topics in the theory of neutron star cooling
N87-12515

D

DEFENCE AND CIVIL INST. OF ENVIRONMENTAL MEDICINE, DOWNSVIEW (ONTARIO).
Relationship of field tests to laboratory tests of muscular strength and endurance, and maximal aerobic power
[AD-A169280] N87-12150
Learning graphics programming by direct communication
N87-12204
DEFENCE SCIENCE AND TECHNOLOGY ORGANIZATION, SALISBURY (AUSTRALIA).
Managing software complexity
[ERL-0372-RE] N87-12248
DELAWARE UNIV., NEWARK.
Optimization of p-CuInSe sub 2/n-CdZnS solar cells
[DE86-010700] N87-12062
DEPARTMENT OF THE AIR FORCE, WASHINGTON, D.C.
Electroluminescent (EL) remotely-controlled landing zone marker light system
[AD-D012395] N87-11716
Electro-optical control of solid fuel rocket burn rate
[AD-D012397] N87-11830
Automated tape laying machine for composite structures
[AD-D012398] N87-11851
Hand off integrator apparatus for signal detection
[AD-D012391] N87-11926
Multiple task oriented processor
[AD-D012392] N87-12170
Plurality of processors where access to the common memory requires only a single clock interval
[AD-D012395] N87-12269
Dynamic bar pattern method
[AD-D012385] N87-12342
Phase-only optical filter for use in an optical correlation system
[AD-D012396] N87-12343
DEUTSCHE FORSCHUNGS- UND VERSUCHSANSTALT FUER LUFT- UND RAUMFAHRT, BRUNSWICK (WEST GERMANY).
Investigation of magnetometer errors and their compensation in the BO-105 helicopter
[DFVLR-FB-86-21] N87-11784
DEUTSCHE FORSCHUNGS- UND VERSUCHSANSTALT FUER LUFT- UND RAUMFAHRT, COLOGNE (WEST GERMANY).
Fretting fatigue of carbon fiber reinforced plastic laminates
[DFVLR-FB-86-18] N87-11865
Fatigue properties of high strength titanium alloys at elevated temperatures (full doc)
[DFVLR-FB-86-19] N87-11885
DEUTSCHE FORSCHUNGS- UND VERSUCHSANSTALT FUER LUFT- UND RAUMFAHRT, GOETTINGEN (WEST GERMANY).
Analytic solutions of the nonlinear partial differential equations for transonic flow in physical space
[DFVLR-FB-86-14] N87-11705
DEUTSCHE FORSCHUNGS- UND VERSUCHSANSTALT FUER LUFT- UND RAUMFAHRT, HAMBURG (WEST GERMANY).
Performance regulation and error control in a test of perceptual speed
[DFVLR-FB-86-13] N87-12164
The value of global self ratings in differential diagnostics
[DFVLR-FB-86-20] N87-12165
DEUTSCHE FORSCHUNGS- UND VERSUCHSANSTALT FUER LUFT- UND RAUMFAHRT, OBERPFAFFENHOFEN (WEST GERMANY).
Investigation on addity-forming ions in wet and dry deposition during the winter season 1984/85
[DFVLR-FB-86-15] N87-12062
DORNIER-WERKE G.M.B.H., FRIEDRICHSHAFEN (WEST GERMANY).
Docking mechanisms technology study
[ESA-CR(P)-2273] N87-11833
Advanced SAR study
[BLS-8345] N87-11931
DOUGLAS AIRCRAFT CO., INC., LONG BEACH, CALIF.
Lightweight sidewalls for aircraft interior noise control
[NASA-CR-172480] N87-12323
DOUGLAS AIRCRAFT CO., INC., ST. LOUIS, MO.
Practical considerations in aeroelastic design
N87-11720
DRAPER (CHARLES STARK) LAB., INC., CAMBRIDGE, MASS.
Dual structural-control optimization of large space structures N87-11766
DYNAMICS TECHNOLOGY, INC., TORRANCE, CALIF.
Calibration of surface hot-film sensors in dilute polymer flows
[AD-A168601] N87-11972
DYNATECH R/D CO., CAMBRIDGE, MASS.
Design of heat exchange element for plastic film heat exchanger
[DE86-011042] N87-11973

E

EASTMAN KODAK CO., ROCHESTER, N. Y.
Fresnel lens study
[DE86-012249] N87-12345
ECOLE CENTRALE DES ARTS ET MANUFACTURES, CHATENAY-MALABRY (FRANCE).
Behavior of an Inconel 718 container in the presence of hydrogen
[ESA-CR(P)-2262] N87-11883
ECOLE NATIONALE SUPERIEURE DES TELECOMMUNICATIONS, PARIS (FRANCE).
Computation of the invariant probability of a nonlinear stochastic system and applications to queuing systems
[ENST-86D007] N87-12311
An approach to a Markovian realization of two-parameter processes
[ENST-86D001] N87-12312
ECOLE POLYTECHNIQUE, MONTREAL (QUEBEC).
Coupling visual and dynamic features to study handwritten signatures N87-12236
EDGERTON, GERMESHAUSEN AND GRIER, INC., LAS VEGAS, NEV.
Audiomagnetotelluric (AMT) system
[DE86-011274] N87-11986
ELORET CORP., SUNNYVALE, CALIF.
Simulation studies for surfaces and materials strength
[NASA-CR-177046] N87-12357
ENERGY CONCEPTS CO., ANNAPOLIS, MD.
New high temperature absorbent for absorption heat pumps
[DE86-013483] N87-11976
ENGINEERING MECHANICS ASSOCIATION, INC., PALO VERDE, CALIF.
Component testing for dynamic model verification
N87-11765
ENVIRONMENTAL PROTECTION AGENCY, RESEARCH TRIANGLE PARK, N.C.
Derivation of damage functions for atmospheric degradation of materials
[PB86-213238] N87-11911
Standard reference photometer network for verification and certification of ozone standards
[PB86-205495] N87-12064
Global atmospheric background monitoring for selected environmental parameters BAPMoN data for 1981. Volume 2: Precipitation chemistry, continuous atmospheric carbon dioxide and suspended particulate matter
[PB86-206360] N87-12066
ESDU INTERNATIONAL LTD., LONDON (ENGLAND).
Normal force, pitching moment and side force of axisymmetric forebody-cylinder combinations for angles of attack up to 90 degrees and Mach numbers up to 1.2
[ESDU-86009] N87-11690
Pitot and static errors in steady level flight
[ESDU-86008] N87-11691
Drag and pressure recovery characteristics of auxiliary air inlets at subsonic speeds
[ESDU-86002] N87-11692
Example of the use of Data Item No. 85001. Choice of reinforcement for a circular hole in a fibre reinforced laminated plate. (Data relating to one particular set of laminate properties)
[ESDU-86003] N87-11844
Effectiveness: N sub TU relationships for the design and performance evaluation of two-stream heat exchangers
[ESDU-86016] N87-11969
Calculation methods for steadily loaded axial groove hydrodynamic journal bearings. Low viscosity process fluid lubrication.
[ESDU-86006] N87-11991
Vertical deflection characteristics of aircraft tyres
[ESDU-86005] N87-11992
Applying, measuring and maintaining pretension in steel bolts
[ESDU-86014] N87-12015
Numerical methods for the solution of ordinary differential equations: Initial value problems
[ESDU-86011] N87-12250
Heat capacity and enthalpy of liquids: Alkanes
[ESDU-86007] N87-12377
EUROPEAN SPACE AGENCY, PARIS (FRANCE).
Comparative flight measurement of icing parameters for the DO 28 D2 propeller-driven aircraft of the German Army Testing Office 61 and for DFVLR's Falcon 20 E jet aircraft in stratus clouds
[ESA-TT-941] N87-11709
Design of a control system for a cryogenic wind tunnel optimizing a vector performance index
[ESA-TT-985] N87-11804
Boundary layer and parabolic flows
[ESA-TT-918] N87-11979
Measurement of radiation intensity at the solar tower plant SSPS/CRS of the IEA in Spain
[ESA-TT-961] N87-12055
Extended analysis of the structure of error scores in psychological aptitude tests
[ESA-TT-943] N87-12163
Two methods for calculating acoustic wave propagation through an interface
[ESA-TT-955] N87-12325
On sound propagation in centrifugal fan casings
[ESA-TT-957] N87-12326
EUROPEAN SPACE TRIBOLOGY LAB., RISLEY (ENGLAND).
Report on the dismantling and examination of Dornier System GmbH medium speed mechanism on completion of a seven year real-life test
[ESA-ESTL-95] N87-11835
Performance limits of surface-hardened aluminum-alloy gears in vacuum
[ESA-ESTL-059] N87-11884
Activities report in space tribology
[ESA-ESTL-77] N87-12005
EXECUTIVE OFFICE OF THE PRESIDENT, WASHINGTON, D. C.
Biennial science and technology report to the Congress, 1983-1984
[PB86-209632] N87-12403

UNITED TECHNOLOGIES CORP., EAST HARTFORD, CONN.
Mechanical properties of various alloys in hydrogen
[NASA-CR-176874] N87-11889
UNITED TECHNOLOGIES RESEARCH CENTER, EAST HARTFORD, CONN.
Optimization of helicopter rotor blade design for minimum vibration N87-11756
User's manual for a TEACH computer program for the analysis of turbulent, swirling reacting flow in a research combustor
[NASA-CR-179547] N87-11858
UNIVERSAL TECHNOLOGY CORP., DAYTON, OHIO.
A research planning assessment for applications of artificial intelligence in manufacturing
[AD-A168692] N87-12252
UNIVERSITY COLL. OF NORTH STAFFORDSHIRE, KEELE (ENGLAND).
Kinetic and spectroscopic studies of chemical intermediates at both high and low temperatures
[AD-A168758] N87-11861
UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES.
Public perspectives on government information technology: A review of survey research on privacy, civil liberties and the democratic process
[PB86-218419] N87-12399

V

VANDERBILT UNIV., NASHVILLE, TENN.
Matching extension in bipartite graphs. 1. Introduction and terminology
[AD-A168666] N87-12265
VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG.
Optimization of cascade blade mistuning under flutter and forced response constraints N87-11732
Environmentally stable polymers and coatings for space application: CH-5, supplement 10
[NASA-CR-177181] N87-11890
Sensitivity analysis and approximation methods for general eigenvalue problems
[NASA-CR-179536] N87-12021
VIRGINIA UNIV., CHARLOTTESVILLE.
Detection of faults and software reliability analysis
[NASA-CR-179635] N87-12241
A second generation experiment in fault-tolerant software
[NASA-CR-179646] N87-12242
The implementation and use of Ada on distributed systems with high reliability requirements
[NASA-CR-179606] N87-12243
The implementation and use of Ada on distributed systems with high reliability requirements
[NASA-CR-179642] N87-12265
VRIJE UNIVERSITEIT, AMSTERDAM (NETHERLANDS).
The FORTRAN Formula Manipulator (FFM)
[REPT-293] N87-12264
Monotonicity of rank statistics in some nonparametric testing problems
[REPT-292] N87-12314
Classification of weakly infinite-dimensional spaces and essential mappings
[REPT-289] N87-12317
N-dimensional totally disconnected topological groups
[REPT-296] N87-12318

W

WAGENINGEN AGRICULTURAL UNIV. (NETHERLANDS).
Teledetection by aquatic plants. Investigation of the possibilities of multispectral photography and spectroradiometry
[VLT-1985-11] N87-12045
WASHINGTON STATE UNIV., PULLMAN.
Spectral characteristics and the extent of paleosols of the Palouse formation
[NASA-CR-179727] N87-12004
An alternate method for determining atmospheric stability N87-12061
WASHINGTON UNIV., SEATTLE.
Reconstruction and display of the retina N87-12238
WASHINGTON UNIV., ST. LOUIS, MO.
Ground-based studies of Jupiter, Uranus, and Neptune in support of the Galileo and Voyager missions N87-12434
High resolution spectral imagery of comets N87-12470
WATERLOO UNIV. (ONTARIO).
A fast algorithm for general raster rotation N87-12188
A cel-based model for paint systems N87-12189
Design and experience with a generalized raster toolkit N87-12190
Hardware assistance for Z-buffer visible surface algorithms N87-12205
Cortical representation of texture primitives N87-12227
WATERVLIET ARSENAL, N.Y.
Effect of resistance on projectile oscillations in augmented rail guns
[DE86-012424] N87-11819
WEIDLINGER ASSOCIATES, PALO ALTO, CALIF.
A numerical study of diffraction in reentrant geologic structure
[AD-A168582] N87-12072
WEIZMANN INST. OF SCIENCE, REHOVOTH (ISRAEL).
High-efficiency, thin-film, cadmium chalcogenide photoelectrochemical cell with in situ storage
[DE86-004451] N87-11945
WISCONSIN UNIV., MADISON.
Interfacial reactions between amorphous W-Si thin films and polycrystalline overlayers
[DE86-009969] N87-12372
Ground-based observations of the Jupiter plasma torus N87-12432
Ground-based observation of Comet Halley N87-12468
WISCONSIN UNIV., MILWAUKEE.
Third-moment closure of turbulence for predictions of separating and reattaching shear flows: A study of Reynolds-stress closure model
[NASA-CR-177055] N87-11961
Technology transfer primer
[PB86-206341] N87-12404
WORCESTER POLYTECHNIC INST., MASS.
Interfacing image processing and computer graphics systems using an artificial visual system N87-12210

Y

YALE UNIV., NEW HAVEN, CONN.
Inversion of ocean data
[AD-A168676] N87-12009
Dynamic grid manipulation for PDEs (Partial Differential Equations) on hypercube parallel processors
[AD-A168679] N87-12296
Systolic array synthesis: Computability and time cones
[AD-A168697] N87-12267
Controlling outliers in contingent valuation experiments
[PB86-210465] N87-12299
YORK UNIV. (ONTARIO).
Correspondence in apparent motion: Defining the heuristics N87-12229

Typical Contract Number Index Listing

N00014-81-C-0006 ..... N87-10545

CONTRACT NUMBER — NASA ACCESSION NUMBER

Listings in this index are arranged alphanumerically by contract number. Under each contract number the NASA accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order. The NASA accession number denotes the number by which the citation is identified.

Typical Report Number Index Listing

Listings in this index are arranged alphanumerically by report number. The NASA accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

WHAT YOU CAN DO FOR *STAR*

All users of this abstract service are urged to forward reports to be considered for announcement in *STAR*. This will aid NASA in its efforts to provide the fullest possible coverage of all scientific and technical publications that might support aeronautics and space research and development. If you have prepared relevant reports (other than those that you will transmit to NASA, DoD, or DOE through the usual contract- or grant-reporting channels), please send them for consideration to the NASA Scientific and Technical Information Facility, P.O. Box 8757, B.W.I. Airport, Maryland 21240.

Reprints of journal articles, book chapters, and conference papers are also welcome. These will be considered for announcement in *STAR's* companion journal, *International Aerospace Abstracts*.

You may specify a particular source to be included in a report announcement if you wish; otherwise the report will be placed on public sale at the National Technical Information Service. Copyrighted publications will be announced but not distributed or sold.

PURCHASE OF *STAR*

The semimonthly issues are available for sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

PUBLISHED BY:

UNITED STATES GOVERNMENT
NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
SCIENTIFIC AND TECHNICAL INFORMATION BRANCH
Scientific and Technical Aerospace Reports, Volume 25, is prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by RMS Associates.

The Administrator of the National Aeronautics and Space Administration has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Agency. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through March 22, 1988.

US ISSN 0036-8741

INTRODUCTION

Scientific and Technical Aerospace Reports (STAR) is a major component of a comprehensive National Aeronautics and Space Administration information system covering aeronautics, space, and supporting disciplines. *STAR* is issued on the 8th and 23rd of each month and announces current publications of the following types:

- NASA, NASA contractor, and NASA grantee reports
- Reports issued by other U.S. Government Agencies, domestic and foreign institutions, universities, and private firms
- Translations in report form
- NASA-owned patents and patent applications
- Dissertations and theses

Journal, book, and conference literature, cover-to-cover journal translations, and certain foreign dissertations are announced in a companion journal, *International Aerospace Abstracts (IAA)*, available on subscription from the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

SUBJECT SCOPE

Subject scope of *STAR*, and *IAA* includes all aspects of aeronautics and space research and development, supporting basic and applied research, and applications. Aerospace aspects of earth resources, energy development, conservation, oceanography, environmental protection, urban transportation, and other topics of high national priority are also covered.

OTHER NASA PUBLICATIONS

Other NASA publications and information services are described in the publication, *The NASA Scientific and Technical Information System ... and How to Use It*, available without charge from the NASA Scientific and Technical Information Facility, P.O. Box 8757, B.W.I. Airport, Maryland 21240.

HOW TO USE *STAR* SUBJECT CATEGORIES

STAR is categorized by 10 major subject divisions divided into 76 specific subject categories and one general category/division. The major subject divisions are listed in the Table of Contents, together with a note for each that defines its scope and provides any cross-references. For example:

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

Each major division is further divided into as many as nine specific categories, which are identified by category numbers.

READEX FICHE best copy available

Abstracts in *STAR* are grouped by specific category, the categories appearing in sequential order. Category breaks in the abstract section are identified by the category number and title, and a scope note. Cross-references to other categories are provided as appropriate. For example:

02 AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer.*

CROSS-REFERENCES

Individual *STAR* abstracts are not ordinarily cross-referenced, except for certain conference reports or book translations that have had separate abstracts written for their component papers or chapters. Citations and abstracts of the components follow immediately after those of the parent document. When the subject content of a component differs sufficiently from the general content of the parent, a cross-reference citation also is printed at the end of the category to which it normally would have been assigned if it were independent.

DOCUMENTS ON MICROFICHE

Documents on microfiche[1] are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

AVAILABILITIES

One or more sources from which a document announced in *STAR* is available to the public is given in each citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code following the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address, both of which are on page vi.

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: US Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of $1.50 each, postage free. (See discussion of NASA patents and patent applications below.)

Avail: (US Sales Only). These foreign documents are available to users within the United States from the National Technical Information Service (NTIS). They are available to users outside the United States through the International Nuclear Information Service (INIS) representative in their country, or by applying directly to the issuing organization.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

NASA PATENTS AND PATENT APPLICATIONS

Patents and patent applications owned by NASA are announced in *STAR* under appropriate subject categories and are referenced in the *STAR* indexes. In the Report/Accession Number Index, patents are indexed by the NASA Case Number (which appears in lieu of the report number in other indexes), the U.S. Patent Number, the U.S. Patent Application Serial Number, and the U.S. Patent Class. Patent applications for which patents have not yet been issued are indexed by the NASA Case Number and the U.S. Patent Application Serial Number.

NASA *patent application specifications* are sold in paper copy by the National Technical Information Service at price code A02. Microfiche are sold at price code A01. The US-Patent-Appl-SN- number should be used in ordering either paper copy or microfiche from NTIS. Printed copies of *patents* (which are not microfiched) are available for purchase at $1.50 per copy from:

Commissioner of Patents and Trademarks
U.S. Patent and Trademark Office
Washington, D.C. 20231

When ordering patents, the U.S. Patent Number should be used, and payment must be remitted in advance, preferably by money order or check payable to the Commissioner of Patents and Trademarks. Prepaid purchase coupons for ordering are also available from the Patent and Trademark Office. The patents and patent applications announced in *STAR* are owned by NASA and are available for royalty-free licensing. Requests for licensing terms and further information should be addressed to:

Assistant General Counsel for Patent Matters/Code GP
National Aeronautics and Space Administration
Washington, D.C. 20546

ELIGIBILITY AND REGISTRATION FOR NASA INFORMATION PRODUCTS AND SERVICES

A variety of services is available to organizations of the following types that have registered with NASA to receive specific services or products:

1. NASA offices, research centers, contractors, subcontractors, grantees, and consultants;
2. Other U.S. Government agencies and their contractors;
3. Libraries in the United States that have arrangements with NASA to maintain collections of NASA documents for public reference;
4. Other organizations in the United States having a need for NASA documents in work related to aeronautics and space research;
5. Organizations abroad that have established reciprocal document exchange arrangements with NASA.

Only the central service points or central points of document acquisition and control within qualified organizations are eligible to register for NASA products and services. Domestic organizations that may be eligible to receive various classes of NASA publications and services should address their requests for registration or for further information to:

NASA Scientific and Technical Information Facility
ATTN: Registration Activity
P.O. Box 8757
B.W.I. Airport, Maryland 21240

Organizations abroad should direct requests to the same address, but to the attention of: International Exchange Program.

AVAILABILITY OF *STAR* ABSTRACTS ON MICROFICHE

Microfiche of the abstract sections of this issue and other issues of *STAR* are available on annual subscription from NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield, Virginia 22161. Annual subscription rates are $70.00 North America; $140.00 foreign. Abstract sections for previous years retroactive to 1964 are available at the current rates. Microfiche for individual *STAR* issue abstract sections are not available.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC: NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019

EUROPEAN: An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA - Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 Paris CEDEX 15, France.

FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

VOLUME 25 NUMBER 4 / FEBRUARY 23, 1987

TABLE OF CONTENTS

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

01 AERONAUTICS (GENERAL) 437

02 AERODYNAMICS 437

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*

03 AIR TRANSPORTATION AND SAFETY 439

Includes passenger and cargo air transport operations; and aircraft accidents.

For related information see also *16 Space Transportation* and *85 Urban Technology and Transportation*.

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION 440

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

For related information see also *17 Space Communications, Spacecraft Communications, Command and Tracking* and *32 Communications and Radar*.

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE 441

Includes aircraft simulation technology.

For related information see also *18 Spacecraft Design, Testing and Performance* and *39 Structural Mechanics*. For land transportation vehicles see *85 Urban Technology and Transportation*.

06 AIRCRAFT INSTRUMENTATION N.A.

Includes cockpit and cabin display devices; and flight instruments.

For related information see also *19 Spacecraft Instrumentation* and *35 Instrumentation and Photography*.

07 AIRCRAFT PROPULSION AND POWER 442

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and onboard auxiliary power plants for aircraft.

For related information see also *20 Spacecraft Propulsion and Power, 28 Propellants and Fuels*, and *44 Energy Production and Conversion*.

08 AIRCRAFT STABILITY AND CONTROL 443

Includes aircraft handling qualities; piloting; flight controls; and autopilots.

For related information see also *05 Aircraft Design, Testing and Performance*.

09 RESEARCH AND SUPPORT FACILITIES (AIR) 444

Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tubes; and aircraft engine test stands.

For related information see also *14 Ground Support Systems and Facilities (Space)*.

ASTRONAUTICS

Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; space communications, spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

For related information see also *Aeronautics*

12 ASTRONAUTICS (GENERAL) 444

For extraterrestrial exploration see *91 Lunar and Planetary Exploration*.

13 ASTRODYNAMICS 444

Includes powered and free-flight trajectories; and orbital and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) 445

Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators.

For related information see also *09 Research and Support Facilities (Air)*.

15 LAUNCH VEHICLES AND SPACE VEHICLES 445

Includes boosters; operating problems of launch/space vehicle systems; and reusable vehicles.

For related information see also *20 Spacecraft Propulsion and Power*.

16 SPACE TRANSPORTATION 446

Includes passenger and cargo space transportation, e.g., shuttle operations; and space rescue techniques.

For related information see also *03 Air Transportation and Safety* and *18 Spacecraft Design, Testing and Performance*. For space suits see *54 Man/System Technology and Life Support*.

17 SPACE COMMUNICATIONS, SPACECRAFT COMMUNICATIONS, COMMAND AND TRACKING N.A.

Includes telemetry; space communications networks; astronavigation and guidance; and radio blackout.

For related information see also *04 Aircraft Communications and Navigation* and *32 Communications and Radar*.

18 SPACECRAFT DESIGN, TESTING AND PERFORMANCE 447

Includes satellites; space platforms; space stations; spacecraft systems and components such as thermal and environmental controls; and attitude controls.

For life support systems see *54 Man/System Technology and Life Support*. For related information see also *05 Aircraft Design, Testing and Performance, 39 Structural Mechanics*, and *16 Space Transportation*.

19 SPACECRAFT INSTRUMENTATION 449

For related information see also *06 Aircraft Instrumentation* and *35 Instrumentation and Photography*.

20 SPACECRAFT PROPULSION AND POWER 449

Includes main propulsion systems and components, e.g. rocket engines; and spacecraft auxiliary power sources.

For related information see also *07 Aircraft Propulsion and Power, 28 Propellants and Fuels, 44 Energy Production and Conversion*, and *15 Launch Vehicles and Space Vehicles*.

CHEMISTRY AND MATERIALS

Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; propellants and fuels; and materials processing.

23 CHEMISTRY AND MATERIALS (GENERAL) 450

24 COMPOSITE MATERIALS 451

Includes physical, chemical, and mechanical properties of laminates and other composite materials.

For ceramic materials see *27 Nonmetallic Materials*.

25 INORGANIC AND PHYSICAL CHEMISTRY 452

Includes chemical analysis, e.g., chromatography; combustion theory; electrochemistry; and photochemistry.

For related information see also *77 Thermodynamics and Statistical Physics*.

26 METALLIC MATERIALS 456

Includes physical, chemical, and mechanical properties of metals, e.g., corrosion; and metallurgy.

27 NONMETALLIC MATERIALS 462

Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials.

For composite materials see *24 Composite Materials*.

28 PROPELLANTS AND FUELS 465

Includes rocket propellants, igniters and oxidizers; their storage and handling procedures; and aircraft fuels.

For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power*, and *44 Energy Production and Conversion*.

29 MATERIALS PROCESSING N.A.

Includes space-based development of products and processes for commercial application.

For biological materials see *55 Space Biology*.

ENGINEERING

Includes engineering (general); communications and radar; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

For related information see also *Physics*.

31 ENGINEERING (GENERAL) 466

Includes vacuum technology; control engineering; display engineering; cryogenics; and fire prevention.

32 COMMUNICATIONS AND RADAR 468

Includes radar; land and global communications; communications theory; and optical communications.

For related information see also *04 Aircraft Communications and Navigation* and *17 Space Communications, Spacecraft Communications, Command and Tracking*. For search and rescue see *03 Air Transportation and Safety*, and *16 Space Transportation*.

33 ELECTRONICS AND ELECTRICAL ENGINEERING 474

Includes test equipment and maintainability; components, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuitry.

For related information see also *60 Computer Operations and Hardware* and *76 Solid-State Physics*.

34 FLUID MECHANICS AND HEAT TRANSFER 482

Includes boundary layers; hydrodynamics; fluidics; mass transfer and ablation cooling.

For related information see also *02 Aerodynamics* and *77 Thermodynamics and Statistical Physics*.

35 INSTRUMENTATION AND PHOTOGRAPHY 485

Includes remote sensors; measuring instruments and gages; detectors; cameras and photographic supplies; and holography.

For aerial photography see *43 Earth Resources and Remote Sensing*. For related information see also *06 Aircraft Instrumentation* and *19 Spacecraft Instrumentation*.

36 LASERS AND MASERS 488

Includes parametric amplifiers.

For related information see also *76 Solid-State Physics*.

37 MECHANICAL ENGINEERING 492

Includes auxiliary systems (nonpower); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY 498

Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS 498

Includes structural element design and weight analysis; fatigue; and thermal stress.

For applications see *05 Aircraft Design, Testing and Performance* and *18 Spacecraft Design, Testing and Performance*.

GEOSCIENCES

Includes geosciences (general); earth resources and remote sensing; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

For related information see also *Space Sciences.*

42 GEOSCIENCES (GENERAL) 504

43 EARTH RESOURCES AND REMOTE SENSING 506

Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography.

For instrumentation see *35 Instrumentation and Photography.*

44 ENERGY PRODUCTION AND CONVERSION 512

Includes specific energy conversion systems, e.g., fuel cells; global sources of energy; geophysical conversion; and windpower.

For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power,* and *28 Propellants and Fuels.*

45 ENVIRONMENT POLLUTION 514

Includes atmospheric, noise, thermal, and water pollution.

46 GEOPHYSICS 515

Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism.

For space radiation see *93 Space Radiation.*

47 METEOROLOGY AND CLIMATOLOGY 520

Includes weather forecasting and modification.

48 OCEANOGRAPHY 534

Includes biological, dynamic, and physical oceanography; and marine resources.

For related information see also *43 Earth Resources and Remote Sensing.*

LIFE SCIENCES

Includes life sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and space biology.

51 LIFE SCIENCES (GENERAL) 534

52 AEROSPACE MEDICINE 535

Includes physiological factors; biological effects of radiation; and effects of weightlessness on man and animals.

53 BEHAVIORAL SCIENCES 538

Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT 539

Includes human engineering; biotechnology; and space suits and protective clothing.

For related information see also *16 Space Transportation.*

55 SPACE BIOLOGY N.A.

Includes exobiology; planetary biology; and extraterrestrial life.

MATHEMATICAL AND COMPUTER SCIENCES

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

59 MATHEMATICAL AND COMPUTER SCIENCES (GENERAL) N.A.

60 COMPUTER OPERATIONS AND HARDWARE 543

Includes hardware for computer graphics, firmware, and data processing.

For components see *33 Electronics and Electrical Engineering.*

61 COMPUTER PROGRAMMING AND SOFTWARE 544

Includes computer programs, routines, algorithms, and specific applications, e.g., CAD/CAM.

62 COMPUTER SYSTEMS 547

Includes computer networks and special application computer systems.

63 CYBERNETICS 548

Includes feedback and control theory, artificial intelligence, robotics and expert systems.

For related information see also *54 Man/System Technology and Life Support.*

64 NUMERICAL ANALYSIS 548

Includes iteration, difference equations, and numerical approximation.

65 STATISTICS AND PROBABILITY 551

Includes data sampling and smoothing; Monte Carlo method; and stochastic processes.

66 SYSTEMS ANALYSIS 554

Includes mathematical modeling; network analysis; and operations research.

67 THEORETICAL MATHEMATICS 554

Includes topology and number theory.

PHYSICS

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

Scramjet phenomena were studied using the shock tunnel T3 at the Australian National University. Simple two dimensional models were used with a combination of wall and central injectors. Silane as an additive to hydrogen fuel was studied over a range of temperatures and pressures to evaluate its effect as an ignition aid. The film cooling effect of surface injected hydrogen was measured over a wide range of equivalence. Heat transfer measurements without injection were repeated to confirm previous indications of heating rates lower than simple flat plate predictions for laminar boundary layers in equilibrium flow. The evious results were reproduced and the discrepancies are discussed in terms of the model geometry and departures of the flow from equilibrium. In the thrust producing mode, attempts were made to increase specific impulse with wall injection. Some preliminary tests were also performed on shock induced ignition, to investigate the possibility in flight of injecting fuel upstream of the combustion chamber, where it could mix but not burn. THE EFFECT OF A WINGLET ON THE SPATIAL VORTEX OF A SLENDER BODY AT HIGH ANGLE OF ATTACK
Wang Zixing and Wu Genxing 7 Jul. 1986 15 p Transl. into ENGLISH from Konggi Donglixue Xuebao (China), v. 3, no. 1, 1985 p 49-53
(AD-A169925; FTD-ID(RS)T-0267-86) Avail: NTIS HC A02/MF A01 CSCL 20/4

The experimental investigation of the effect of a winglet on the spatial vortex of a slender body at a high angle of attack is presented. This investigation clearly shows that the circulation of the body vortex is minimized by the winglet and the vortex position is lower than that without the winglet, so that the asymmetric problem can be solved. THE PORTFOLIO MODEL OF TECHNOLOGICAL DEVELOPMENT IN THE AIRCRAFT INDUSTRY M.S. Thesis
David M. Snyder May 1986 56 p
(AD-A170832; AFIT/CI/NR-86-84T) Avail: NTIS HC A04/MF A01 CSCL 05/3

The aircraft industry has long been considered the quintessential high technology industry. By examining the dynamics of technological change in this industry the portfolio model of technological advancement is developed. This model may be used to describe technological advancement in large sophisticated, technology intensive systems. The rapid advancement of individual technologies as measured by improvements in specific performance parameters is evident in the aircraft industry. However, the ability of a technology to improve performance in one or more key performance parameter may lead to adverse effects in other performance parameters or may not be compatible with other technological developments that are occurring in the industry. Individual technical improvements can be characterized as either portfolio reinforcing or portfolio shifting depending on whether or not they promote shift in the way the technologies are combined into a total system or portfolio. The commercially and economically successful products appear to be those that combine technologies into an optimum bundle of performance characteristics or portfolio. Technologies that flourish are not always the technologies on the leading edge of the performance frontier, but are those technologies that product the optimum portfolio. Author (GRA)

VISCOUS-INVISCID INTERACTION IN TRANSONIC SEPARATED FLOW OVER SOLID AND POROUS AIRFOILS AND CASCADES Ph.D. Thesis
Charles Randolph Olling 1985 185 p
Avail: Univ. Microfilms Order No. DA8609621

Viscous-inviscid interaction is used to compute steady two-dimensional, transonic separated flows for cascades and isolated airfoils. The full-potential code of Dulikravich is coupled with both a laminar/transition/turbulent integral boundary-layer/tubulent wake code written by the author and the finite-difference boundary-layer code of Drela using the semi-inverse method of Carter or Wigton. The transpiration coupling concept is applied. An option for a porous airfoil with passive physical transpiration is also included. Examples are presented which demonstrate that such flows can be calculated with engineering accuracy by the present code. The equivalent transpiration velocity can be larger in cascades than for isolated airfoils. Carter's update formula gives smoother solutions for a strong shock than Wigton's update formulas, although Wigton's formulas are preferred in the early coupling cycles for cascades. The computations show that passive physical transpiration can lead to a lower drag coefficient and higher lift coefficient, a weaker shock and elimination of shock-induced separation. The extent of the porous region and permeability factor distribution of the porous region must be chosen carefully if these improvements are to be achieved. Dissert. Abstr.

N87-12536 ESDU International Ltd., London (England).
INTRODUCTION TO AERODYNAMICS DERIVITIVES, EQUATIONS OF MOTION AND STABILITY
Oct. 1986 64 p Supersedes ESDU-Aero-A.00.00.02, ESDU-Aero-A.00.00.03, ESDU-Aero-A.00.00.04, and ESDU-67039
(ESDU-86021; ISBN-0-85679-573-9; ISSN-0141-397X) Avail: ESDU

This Data Item ESDU 86021 is an addition to the Aerodynamics Sub-series. It is a comprehensive introduction to the concept and use of derivatives in determining aircraft stability. After explaining a systematic method for expressing aerodynamic forces, moments, and derivatives in dimensionless form, the equations of motion for an aircraft treated as a rigid body are developed and the linearized small-perturbation form introduced. The conditions are outlined for the separation of the equations

into a lateral and a longitudinal set, and a detailed study is made of the behavior of an aircraft disturbed with controls fixed from straight symmetric level flight. A comprehensive practical worked example illustrates the use of the techniques. A comparison is made between the ISO notation for derivatives used by ESDU, and the most widely used notation in the US, equations are given for deriving the longitudinal derivatives from the force and moment coefficients, and reference is included to all the ESDU validated data for lateral derivatives. Also included is the traditional treatment for static stability leading to the definitions of static and maneuver margins, and the relation between static stability and dynamic stability is discussed. Finally, a description is given in simple physical terms of commonly occurring lateral modes of an aircraft following a small disturbance. ESDU

PROPELLAR/BODY INTERACTION FOR THRUST AND DRAG
Aug. 1986 20 p
(ESDU-86017; ISBN-0-85679-569-0; ISSN-0141-397X) Avail: ESDU

Available as part of the ESDU Sub-series on Aerodynamics, this document gives a simple method of estimating the thrust decrement and drag increment due to the interaction of propeller flow with a body (or nacelle) at zero incidence. It applies to smoothly contoured bodies with a tractor propeller at or near the nose or a pusher propeller at or near the tail and the propellers may be counter-rotating. It applies to Mach numbers up to 80 per cent of critical for the spinner-body combination. The method predicts the propulsive thrust in terms of the shaft thrust developed to within 2 or 3 per cent of thrust. A detailed discussion of the factors affecting the interaction effects is included. A comprehensive worked example shows how the method is used in combination with the method of ESDU 83001 for the propeller free-air thrust and of ESDU 78019 for the body drag propeller-off. ESDU

MACH 6 EXPERIMENTAL AND THEORETICAL STABILITY AND PERFORMANCE OF A FINNED CYLINDRICAL BODY AT ANGLES OF ATTACK UP TO 65 DEG
Edward R. Hartman and Patrick J. Johnston Sep. 1986 45 p
(NASA-TM-89050; NAS 1.15:89050) Avail: NTIS HC A03/MF A01 CSCL 01A

A theoretical and experimental investigation of the longitudinal and lateral-directional stability and control of a finned cylindrical body has been conducted at Mach 6. The angle-of-attack range extended from 20 to 65 deg. to encompass maximum lift. Stability, performance, and trim could be accurately predicted with the fins in the + arrangement but this was not the case when the fins were in the x orientation where windward fin choking occurred at angles of attack above 50 deg. reducing their effectiveness and causing pitch up. AN EXPERIMENTAL INVESTIGATION OF FREE-TIP RESPONSE TO A JET
Larry A. Young Sep. 1986 56 p
(NASA-TM-88250; A-86234; NAS 1.15:88250) Avail: NTIS HC A04/MF A01 CSCL 01A

The aerodynamic response of passively oscillating tips appended to a model helicopter rotor was investigated during a whirl test. Tip responsiveness was found to meet free-tip rotor requirements. Experimental and analytical estimates of the free-tip aerodynamic spring, mechanical spring, and aerodynamic damping were calculated and compared. The free tips were analytically demonstrated to be operating outside the tip resonant response region at full-scale tip speeds. Further, tip resonance was shown to be independent of tip speed, given the assumption that the tip forcing frequency is linearly dependent upon the rotor rotational speed. Author

AN APPROXIMATE METHOD OF ESTIMATING THE AERODYNAMIC INTERFERENCE BETWEEN TWO PARALLEL BODIES IN A SUPERSONIC FLOW (AXIAL FORCE)
Hirofumi Kondo Mar. 1985 28 p Transl. into ENGLISH from Technical Report of National Aerospace Laboratory, TR-751, 1983
(BR-100271; RAE-Trans-2131) Avail: NTIS HC A03/MF A01

An approximate method of estimating the aerodynamic interference between two parallel bodies in a supersonic flow is discussed. The formulae are derived from linearized theory. The formulae for calculating the wave drag on one body are obtained as functions of Mach number, cone semi-vertex angle, and the relative distances between bodies. Theoretical calculations are compared with wind tunnel test results, and fairly good agreement is noted. It is pointed out that the present method can easily be applied to a combination of more than two bodies. Author

N87-12541*# National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
EFFECT OF PORT CORNER GEOMETRY ON THE INTERNAL PERFORMANCE OF A ROTATING-VANE-TYPE THRUST REVERSER
Bobby L. Berrier and Francis J. Capone Dec. 1986 51 p
(NASA-TP-2624; L-16135; NAS 1.60:2624) Avail: NTIS HC A04/MF A01 CSCL 01A

An investigation has been conducted in the static-test facility of the Langley 16-Foot Transonic Tunnel to determine the effects of reverser port geometry on the internal performance of a nonaxisymmetric rotating-vane-type thrust reverser. Thrust reverser vane positions representing a spoiled-trust (partially deployed) position and a full-reverse-thrust (fully deployed) position were tested with each port geometry variable. The effects of upstream port corner radius and wall angle on internal performance were determined. In addition, the effect of the length of a simulated cooling liner (blunt-base step) near the reverser port entrance was investigated; five different lengths were tested. All tests were conducted with no external flows, and nozzle pressure ratio was varied from 1.2 to 5.0. Author

LENGTH ADJUSTABLE STRUT LINK WITH LOW AERODYNAMIC DRAG Patent
Dudley O. Nash and James A. Crowley, inventors (to Air Force) Issued 25 Feb. 1986 8 p Supersedes AD-D011851
(AD-D012279; US-Patent-4,571,936; US-Patent-Appl-SN-753462;

US-Patent-Class-60-39.31) Avail: US Patent and Trademark Office CSCL 13/5

This invention relates to a low aerodynamic drag structural link suitable for use within the housing of a turbofan jet engine. The link includes length adjustment capability, pivotal end mounting provision, maintained airstream orientation capability, low mass and jam nut length and orientation locking. Several variations in link construction including a single ball and socket arrangement, varying link cross-section along its longitudinal length and the use of fairing nose and tail inserts are disclosed. A SUMMARY OF THE DEVELOPMENT OF INTEGRAL AERODYNAMIC METHODS FOR THE COMPUTATION OF ROTOR WAKE INTERACTIONS Final Report, 1 Aug. 1981 - 30 Aug. 1984
J. M. Summa Mar. 1986 13 p
(Contract DAAG29-81-C-0032)
(AD-A169254; AMI-8605; ARO-18391.3-EG-S) Avail: NTIS HC A02/MF A01 CSCL 20/4

The purpose of the research reported here is to develop basic methodology for a generalized forward flight aerodynamic analysis method for isolated rotors. All of the work thus far has been concerned with the development of integral methods. Efforts have concentrated on analytical modeling studies and code development for fundamental vortex/blade interactions that occur in forward flight. Calculations show that vortex core deformations can be simulated but that numerical errors in the core growth should be removed in order to study such phenomena as bursting. The computed trajectory of a tip vortex passing another wing is also validated with experiment as well as the prediction of vortex induced separations. The calculation of the rotor wake in hover has been improved and the importance of secondary vortex roll ups for a modern rotor is discussed. Finally, a time stepping panel method has been formulated and verified by application to impulsively started wings. A pilot code version for unsteady rotor motions is described along with its preliminary application to a two bladed rotor. GRA

FORCED OSCILLATION OF A TWO-DIMENSIONAL AIRFOIL WITH NONLINEAR AERODYNAMIC LOADS
B. H. Lee and P. LeBlanc Jan. 1986 52 p
(AD-A169350; NAE-LR-617; NRC-25411) Avail: NTIS HC A04/MF A01 CSCL 20/4

Forced oscillation of a two dimensional airfoil with attached and separated flows is investigated using nonlinear unsteady aerodynamics for pitching motion derived from a time synthesization technique utilizing oscillatory loop data determined experimentally. Both one and two degree of freedom oscillations are considered. The structural dynamic equations of motion are integrated by a time marching finite difference scheme. The airfoil response is examined for different values of spring stiffness and magnitudes of externally applied moment. For two degree of freedom vibration, only small plunge amplitude is considered and the aerodynamic loads are approximated by the superposition of nonlinear terms due to pitch and linear terms due to plunge. The presence of a small amplitude plunging motion increases the pitch amplitude slightly for attached flow, while a decrease in pitch amplitude is predicted for separated flow. GRA

N87-12547 Stanford Univ., Calif.
AN ANALYSIS OF BLADE VORTEX INTERACTION AERODYNAMICS AND ACOUSTICS Ph.D. Thesis
Duck Joo Lee 1985 176 p
Avail: Univ. Microfilms Order No. DA8602500

The impulsive noise associated with helicopter flight due to blade-vortex interaction, sometimes called blade slap, is analyzed especially for the case of a close encounter of the blade-tip vortex with a following blade. Three parts of the phenomena are considered: the tip-vortex structure generated by the rotating blade, the unsteady pressure produced on the following blade during the interaction, and the acoustic radiation due to the unsteady pressure field. To simplify the problem, we confine our analysis to the situation where the vortex is aligned parallel to the blade span in which case the maximum acoustic pressure results. The 2-dimensional incompressible flow is assumed with uniform motion of the blade. The tip-vortex is modelled so that the circulation near the tip is rolled into a concentrated vortex and the extreme case of the interaction is studied when the following blade cuts through the center of this vortex core, which is turbulent and viscous. It is further assumed that during the interaction, there is no distortion of the vortex path or of the vortex itself, in other words the interaction occurs only through the boundary condition on the blade giving an unsteady pressure on the blade surface. Acoustic radiation due to the interaction is analyzed in space-fixed coordinates and in the time domain with the unsteady pressure on the blade surface as the source of chordwise compact, but spanwise noncompact radiation. Maximum acoustic pressure is related to the vortex core size and Reynolds number which are in turn functions of the blade-tip aerodynamic parameters. Finally noise reduction and performance are considered. Dissert. Abstr.

N87-12548 Texas Technological Univ., Lubbock.
A NUMERICAL MODEL FOR TWO-DIMENSIONAL UNSTEADY FLOW CALCULATIONS WITH A SURFACE PANEL METHOD Ph.D. Thesis
Bong-Jin Im 1985 132 p
Avail: Univ. Microfilms Order No. DA8607765

A numerical model for two-dimensional airfoils in unsteady motion with boundary layer separation is described. The airfoil and wake surfaces are represented by a finite set of combined source and vortex panels. The source strengths are prescribed to have the same magnitude as the normal relative velocity on the surface due to the free-stream and motion of the airfoil. The vortex strengths on the airfoil surface are determined by applying a kinematic surface tangency condition to a Green's function representation of the potential field, while simultaneously enforcing the Kutta condition. Wake shedding is governed by a dynamic free surface condition and the characteristics of the flow near any boundary layer separation points. Wake deformation is predicted by applying geometric free surface conditions. Calculation results are presented for steady motion, impulsively started rectilinear motion, harmonic pitch oscillations, and constant pitching motions. Experimental data and analytical solutions are also presented for comparison. Dissert. Abstr.

AIRCRAFT ACCIDENT REPORT: BAR HARBOR AIRLINES FLIGHT 1808, BEECH BE-99, N300WP, AUBURN-LEWISTON MUNICIPAL AIRPORT, AUBURN, MAINE, AUGUST 25, 1985

30 Sep. 1986 77 p
(PB86-910408; NTSB-AAR-86-06) Avail: NTIS HC A05/MF A01

About 2205 e.d.t. on August 25, 1985, Bar Harbor Airlines Flight 1818, a Beech Aircraft Corporation Model 99 crashed about 1 mile southwest of the Auburn-Lewiston Municipal Airport at Auburn, Maine, while making an instrument landing system (ILS) approach to runway 4. The weather was indefinite 300-foot ceiling, sky obscured, visibility 1 mile in light drizzle and fog. The flight was a regularly scheduled commuter flight between Boston-Logan International Airport and Bangor, Maine, with intermediate stops at Auburn, Augusta, and Waterville, Maine. All six passengers and the two flightcrew members were killed in the accident. The airplane was destroyed by impact forces and postcrash fire. The National Transportation Safety Board determined that the probable cause of the accident was the captain's continuation of an unstabilized approach which resulted in a descent below glidescope. Contributing to the unstabilized approach was the radar controller's issuance and the captain's acceptance of a nonstandard air traffic control radar vector resulting in an excessive intercept with the localizer.

ANALYSIS AND VERIFICATION OF THE ICING SCALING EQUATIONS. VOLUME 1: REVISION Final Report, 1 Aug. 1981 - 31 Mar. 1984

Gary A. Ruff Mar. 1986 80 p Prepared in cooperation with Arnold Engineering Development Center, Arnold AFS, Tenn.
(AD-A167976; AEDC-TR-85-30-Vol-1-Rev) Avail: NTIS
HC A05/MF A01 CSCL 08/12

Study objectives were to evaluate the equations governing the ice-accretion process to identify proposed scaling parameters and to conduct tests to determine which, is any, of the proposed methods produced scale ice accretions. Study results include: (1) A set of equations that can be used to calculate test conditions so that scaled ice shapes are produced on geometrically similar bodies was developed and experimentally verified. (2) Posttest evaluation of the scaling parameters based on the actual test conditions was necessary for accurate evaluation of test results. (3) An icing similitude computer code, SIMICE, was developed to calculate similitude conditions using the verified scaling equations. (4) The equations were applicable over the range of meteorological conditions found in natural icing, with the possible exception of velocity. (5) Velocity is the primary limitation of the scaling equations. To maintain scaled flow fields and droplet impingement characteristics, both the model and full-scale velocities must yield a Reynolds number > or = 200,000 and < the velocity giving the critical Mach number of the body geometry. (6) At values of dynamic pressure of approximately 1.6 psia, shedding characteristics of the ice accretion were observed to affect the final ice shape.

GUIDANCE LAW SIMULATION STUDIES FOR COMPLEX APPROACHES USING THE MICROWAVE LANDING SYSTEM (MLS)

J. B. Feather Nov. 1986 80 p
(Contract NAS1-18028)
(NASA-CR-178182; NAS 1.26:178182) Avail: NTIS
HC A05/MF A01 CSCL 17G

This report documents results for MLS guidance algorithm development conducted by DAC for NASA under the Advance Transport Operating Systems (ATOPS) Technology Studies program (NAS1-18028). The study consisted of evaluating guidance laws for vertical and lateral path control, as well as speed control, by simulating an MLS approach for the Washington National Airport. This work is an extension and generalization of a previous ATOPS contract (NAS1-16202) completed by DAC in 1985. The Washington river approach was simulated by six waypoints and one glideslope change and consisted of an eleven nautical mile approach path. Tracking performance was generated for 10 cases representing several different conditions, which included MLS noise, steady wind, turbulence, and windshear. Results of this simulation phase are suitable for use in future fixed-base simulator evaluations employing actual hardware (autopilot and a performance management system), as well as crew procedures and information requirements for MLS.

THE EFFECT OF COUPLING IN AN INERTIAL NAVIGATION PLATFORM STABILIZED SYSTEM MADE UP OF THREE SINGLE-DEGREE-OF-FREEDOM GYROSCOPES

Di Bo-Hao 13 Jun. 1986 17 p Transl. into ENGLISH from Chuanbo Gongcheng (China), no. 4, 1985 p 38-42
(AD-A169110; FTD-ID(RS)T-0283-86) Avail: NTIS
HC A02/MF A01 CSCL 17/7

We shall refer to three interacting single-axis systems as a three-axis system. If the interaction between the single-axis systems is weak, the three-axis system can be studied in the single-axis approximation. This approximation could lead to great simplification in the analysis and solution of the problem. On the contrary, if the interaction between the systems is strong, the single-axis approximation is not applicable to the three-axis system. To arrive at the criteria for the applicability of the single-axis approximation, it is necessary to study the effect of coupling between the systems. One type of coupling involves the polar angle and the azimuthal angle. It depends on the geometry of the frame between the platform axes. This type of coupling can be eliminated by a coordinate transformation or an orthogonal transformation. GRA

Differential GPS must communicate differential corrections to civilian users of the Global Positioning System. Modulation of existing marine radiobeacons can provide the needed communica-

tion link for DGPS, provided the operation of existing radiobeacon direction finding equipment is maintained and adequate DGPS range is provided in the presence of atmospheric noise and skywave fading. Existing DF and ADF units were studied through a manufacturers' survey, and a radiobeacon modulation scheme has been proposed that maintains reliable DF and a ADF operation. MSK modulation with a frequency offset of 325 Hz is recommended, with a power offset of -3dB. This scheme limits ADF bearing errors to under 3 deg based on analysis of the modulation energy entering the effective passbands of the various ADF designs. CCir data on atmospheric noise and multipath were studies and a rate 1/2 convolutional code with constraint length 6 is recommended to provide a DGPS bit error probability of less than 0.00001. Reliable DGPS range for 10 nautical mile beacons will be 100 km, and for 30 nm beacons, 195 km. Discussion of interleaving to control atmospheric burst noise is included. GRA

SOME TACTICAL ALGORITHMS FOR SPHERICAL GEOMETRY
Rex H. Shudde Mar. 1986 31 p
(AD-A170615; NPS55-86-008) Avail: NTIS HC A03/MF A01 CSCL 17/7

This report presents two great circle navigation algorithms, a closest point of approach algorithm and intercept algorithm. It also presents an implementation program for the algorithms that is written in the BASIC language for an IBM PC. Instead of using classical spherical geometry or the general spherical triangle, these algorithms incorporate rectangular coordinates and vectors on the surface of the spherical. The intent of the report is to provide algorithms for spherical Earth models that can be used for situations in which flat Earth models are not appropriate, but that do not require the sophistication of rotating Earth models. SIMPLIFIED FORMS OF PERFORMANCE EQUATIONS. ADDENDUM A: EFFECT ON AEROPLANE LEVEL SPEED OF SMALL CHANGES IN THRUST, DRAG, WEIGHT, POWER
May 1986 14 p Supersedes ESDU-EG2/1
(ESDU-86004-Add-A; ISBN-0-85679-556-9; ISSN-0141-4054) Avail: ESDU

This Data Item ESDU 86004 is an addition to the Aircraft Performance Sub-series. Equations and curves are given for a method that neglects the effects of any consequential changes in the other independent variables although, at the cost of increased complexity, a means of including such effects (in particular, compressibility effects on drag) is provided. Several worked examples show how well the simple method compares with actual operations data. This document is an Addendum to ESDU 80032, and illustrates how the equations of motion given there combined with a parabolic drag law yield valuable results. ESDU

NASA ROTOR SYSTEMS RESEARCH AIRCRAFT: FIXED-WING CONFIGURATION FLIGHT-TEST RESULTS
R. E. Erickson, J. L. Cross, R. M. Kufeld, C. W. Acree, D. Nguyen, and R. W. Hodge (Sikorsky Aircraft, Stratford, Conn.) Feb. 1986 124 p
(NASA-TM-86789; A-85363; NAS 1.15:86789) Avail: NTIS HC A06/MF A01 CSCL 01C

The fixed-wing, airplane configuration flight-test results of the Rotor System Research Aircraft (RSRA), NASA 740, at Ames/Dryden Flight Research Center are documented. Fourteen taxi and flight tests were performed from December 1983 to October 1984. This was the first time the RSRA was flown with the main rotor removed; the tail rotor was installed. These tests confirmed that the RSRA is operable as a fixed-wing aircraft. Data were obtained for various takeoff and landing distances, control sensitivity, trim and dynamics stability characteristics, performance rotor-hub drag, and acoustics signature. Stability data were obtained with the rotor hub both installed and removed. The speed envelope was developed to 261 knots true airspeed (KTAS), 226 knots calibrated airspeed (KCAS) at 10,000 ft density altitude. The airplane was configured at 5 deg. wing incidence with 5 deg. wing flaps as a normal configuration. Level-flight data were acquired at 167 KCAS for wing incidence from 0 to 10 deg. Step inputs and doublet inputs of various magnitudes were utilized to acquire dynamic stability and control sensitivity data. Sine-wave inputs of constantly increasing frequency were used to generate parameter identification data. The maximum load factor attained was 2.34 g at 206 KCAS. Author

THE HANDLING QUALITIES AND FLIGHT CHARACTERISTICS OF THE GRUMMAN DESIGN 698 SIMULATED TWIN-ENGINE TILT NACELLE V/STOL AIRCRAFT
Megan A. Eskey and Samuel B. Wilson, III Jun. 1986 112 p
(NASA-TM-86785; A-85361; NAS 1.15:86785) Avail: NTIS HC A06/MF A01 CSCL 01C

This paper describes three government-conducted, piloted flight simulations of the Grumman Design 698 vertical and short takeoff and landing (V/STOL) aircraft. Emphasis is placed on the aircraft's handling qualities as rated by various NASA, Navy, and Grumman Aerospace Corporating pilots with flight experience ranging from conventional takeoff and landing (CTOL) to V/STOL aircraft. Each successive simulation incorporated modifications to the aircraft in order to resolve the flight problems which were of most concern to the pilots in the previous simulation. The objective of the first simulation was to assess the basic handling qualities of the aircraft with the noncross-shafted propulsion system. The objective of the second simulation was to examine the effects of incorporating the cross-shafted propulsion system. The objective of the third simulation was to examine inoperative single-engine characteristics with and without cross-shafted engines. Author

A HEATER MADE FROM GRAPHITE COMPOSITE MATERIAL FOR POTENTIAL DEICING APPLICATION
Ching-cheh Hung, Michael E. Dillehay (Cleveland State Univ., Ohio), and Mark Stahl 1986 22 p Proposed for presentation at the 25th Aerospace Sciences Meeting, Reno, Nev., 12-15 Jan. 1987; sponsored by AIAA
(NASA-TM-88888; E-3298; NAS 1.15:88888) Avail: NTIS HC A02/MF A01 CSCL 01C

A surface heater was developed using a graphite fiber-epoxy composite as the heating element. This heater can be thin, highly electrically and thermally conductive, and can conform to an irregular surface. Therefore it may be used in an aircraft's thermal deicing system to quickly and uniformly heat the aircraft surface. One-ply of unidirectional graphite fiber-epoxy composite was laminated between two plies of fiber glass-epoxy composite, with nickel foil contacting the end portions of the composite and partly exposed beyond the composites for electrical contact. The model heater used brominated P-100 fibers from Amoco. The fiber's

electrical resistivity, thermal conductivity and density were 50 micro ohms per centimeter, 270 W/m-K and 2.30 gm/cubic cm, respectively. The electricity was found to penetrate through the composite in the transverse direction to make an acceptably low foil-composite contact resistance. When conducting current, the heater temperature increase reached 50 percent of the steady state value within 20 sec. There was no overheating at the ends of the heater provided there was no water corrosion. If the foil-composite bonding failed during storage, liquid water exposure was found to oxidize the foil. Such bonding failure may be avoided if perforated nickel foil is used, so that the composite plies can bond to each other through the perforated holes and therefore lock the foil in place. Author

VISUALISATION OF AXIAL TURBINE TIP CLEARANCE FLOW USING A LINEAR CASCADE
J. P. Bindon 1986 66 p
(CUED/A-Turbo/TR-122; ISSN-0309-6521) Avail: NTIS HC A04/MF A01

Gas tracer techniques were not successful in revealing anything except the very generalized movement of fluid from the mainstream into the tip clearance gap. Smoke flow visualization at low Reynolds numbers revealed much of the intricate detail of the flow structure in and around the tip clearance region. Smoke traces were injected both into the mainstream fluid via a rake and also through holes in the blade surface. At low values of clearance, there was no evidence of any separation bubble in the clearance gap and the flow was attached and well behaved as it moved from pressure to suction side. Traces injected on the pressure surface moved radially to enter the clearance gap. In passing round the pressure corner, the traces became transparent indicating an acceleration around the corner. This confirms the measurements elsewhere of extremely low values of pressure on the pressure surface corner. This local high velocity would cause a high heat transfer coefficient on the corner. A test was done to investigate the possibility of cooling the pressure corner by radially exhausting cooling air from the pressure surface near the tip. Qualitative heat transfer studies using a radiantly heated optical film appeared not to be able to resolve the small scale effects near the pressure corner but did clearly show the area of low heat transfer where the separation bubble flow stagnates and separates. THRUST REVERSER-EXHAUST NOZZLE ASSEMBLY FOR A GAS TURBINE ENGINE Patent
Edward B. Thayer, inventor (to Air Force) Issued 27 May 1986 8 p Supersedes AD-D011101
(AD-D012390; US-Patent-4,591,097; US-Patent-Appl-SN-611041; US-Patent-Class-239-265.29) Avail: US Patent and Trademark Office CSCL 21/5

This patent discloses an improved thrust reverser/exhaust nozzle assembly which has a plurality of blocker devices located in the divergent section of the exhaust nozzle and a plurality of deflector devices located in the convergent section of the nozzle. The blocker and deflector devices are linked together such that they move simultaneously and maintain a substantially constant engine between forward and reverse thrust conditions. GRA

COMPONENT IMPROVEMENT PROGRAM TASK 83-01, 36E133 AIR TURBINE STARTER
L. Williams Feb. 1986 36 p
(Contract N00019-80-G-0607)
(AD-A169483; Rept-8720-3173U) Avail: NTIS HC A03/MF A01 CSCL 09/3

The objective of this task was to replace the mechanical cutout switch with a solid-state electronic cutout switch to improve accuracy and reliability of the automatic start cycle termination in the S-3A and F-14A aircraft. The function of the cutout switch is to terminate the start cycle at a predetermined speed. It was determined that the existing electronic circuit can be used for the 36E133/123 with only a minor resistor change to accommodate the subject unit's cutout speed. Breadboard testing was successfully completed and satisfactorily demonstrated feasibility. GRA

Analytical and experimental investigations have been performed to determine crack growth behavior of metals under conditions typical of the service environments of aircraft gas turbine engines. To evaluate baseline crack growth behavior, investigations have also been conducted at elevated temperature in vacuum. The work performed can be divided into three general categories -- development of experimental and automation techniques, material characterization testing, and analytic studies. An automated laser interferometric displacement-measurement system using linear array cards has been developed. Enhancements of existing system for the measurement of crack lengths and displacements are described. A number of computer automation applications are also described. Fatigue and creep crack growth tests and creep rupture and hot corrosion tests were performed. Description of the experimental techniques and the results for these tests are included. Results of analytical investigations in both material modeling and methodology development are presented, including discussions of applications within the laboratory. GRA

TURBINE AIR SEAL WITH FULL BACKSIDE COOLING Patent Application
George Liang, inventor (to Air Force) Filed 12 May 1986 21 p
(AD-D012405; US-Patent-Appl-SN-861909) Avail: NTIS HC A02/MF A01 CSCL 11/1

This patent application relates to air seals for use in turbo-

machinery and, more particularly relates to an air seal assembly with increased cooling that is adapted to withstand elevated engine operating temperatures. The air seal comprises a full 360 degree seal ring that assemblies to the turbine by means of interlocking flanges. A two piece impingement plate which is positioned adjacent to the air seal controls and meters cooling air flow that cools ceramic seal. The backside of air seal is thereby fully cooled before heated cooling air is exhausted from the seal through holes at expansion slots and edge holes at the axial edges of the air seal. GRA

EFFECTS OF TEST CELL RECIRCULATION ON HIGH-BYPASS TURBOFAN ENGINES DURING SIMULATED ALTITUDE TESTS Final Report, Oct. 1984 - May 1985
R. M. Dugas Aug. 1986 89 p Prepared in cooperation with AEDC, Arnold AFS, Tenn.
(AD-A171418; AEDC-TR-85-55) Avail: NTIS HC A05/MF A01 CSCL 21/5

An experimental and analytical program was conducted to determine the nature of the flow field around a subscale model of a high bypass turbofan engine installed in a representatively scaled altitude test cell. The engine model employed variable geometry and flow conditions in order to determine their effects on test cell recirculating flows, which can affect engine performance during altitude testing. Flow field data were obtained from both two axis laser Doppler velocimeters, as well as from pressure and temperature instrumentation installed on the model and test cell. Review of full and 1/10 scale test data and the results of the subscale tests indicate that test cell recirculation effects are a function of cell geometry. Measurement of test cell effects is dependent on a baseline test configuration, such as an outdoor test, where the effects are not present. GRA

EVALUATION OF A NONLINEAR PARAMETER EXTRACTION MATHEMATICAL MODEL INCLUDING THE TERM C(SUBm(SUB DELTA e SQUARED))
William T. Suit Oct. 1986 18 p
(NASA-TM-87731; NAS 1.15:87731) Avail: NTIS HC A02/MF A01 CSCL 01C

Shuttle flight test data were used to determine values for the short-period parameters. The best identified, as judged by its estimated standard deviation, was the elevon effectiveness parameter C (sub m (sub sigma e squared)). However, the scatter about the preflight prediction of C (sub m (sub sigma e squared)) was large. Other investigators have suggested that adding nonlinear terms to the mathematical model used to identify C (sub m (sub sigma e)) could reduce the scatter. The results of this investigation show that C (sub m (sub sigma e squared)) is the only identifiable nonlinear parameter applicable and that the changes in C (sub m (sub sigma e)) values when C (sub m (sub sigma e squared)) is included are in the order of ten percent for the data estimated. BLAST GUST LOADING ON A 35 DEGREE SWEPT-BACK WING Final Report
Charles L. Fisher May 1986 141 p
(AD-A169415; BRL-MR-3519) Avail: NTIS HC A07/MF A01 CSCL 01/3

The Ballistic Research Lab (BRL) performed shock loading tests on a generic wing in the 2.44 meter shock tube. This model was previously tested on the rocked sled facility at Holloman AFB, New Mexico, and is documented in report number DNA 5211F. The purpose of the BRL test was to determine if the data gathered at Holloman AFB on gust loading of the wing could be duplicated in the shock tube. On Feb 20 and 25, 1985, tests were conducted in the BRL shock tube to obtain pressure data on a 35 degree sweptback generic wing model. These data are subsequently compared with equivalent data taken on the same model at the Holloman sled track. GRA

SIMULATOR DESIGN FEATURES FOR HELICOPTER LANDING ON SMALL SHIPS. 1: A PERFORMANCE STUDY Final Report, 1 Sep. 1981 - 26 Apr. 1985
Daniel P. Westra and Gavan Lintern 27 Sep. 1985 63 p
(Contract N61339-81-C-0105)
(AD-A169514; NAVTRASYSCEN-81-C-0105-13) Avail: NTIS HC A04/MF A01 CSCL 05/9

The Visual Technology Research Simulator (VTRS) at the Naval Training Systems Center was used to study the effects of six simulator features on performance for helicopter landings on small ships. The purpose of the experiment was to obtain information relevant to the design of simulators for skill maintenance and transition training, and to obtain information for decisions about future transfer-of-training studies. The six simulator factors were scene detail (high detail ship deck and hangar markings versus no deck and hangar markings), field of view (VTRS-wide versus reduced SH-60B operational flight trainer field of view), system visual lab (217 msec versus 117 msec), g-seat acceleration cuing (off versus on), and collective sound cuing (off versus on). These factors were tested across two levels of seastate and pilot experience. Pilots who participated in the experiment were experienced Navy H-3 rotary wing pilots. Results indicated large effects of scene detail, small to moderate effects for visual lag, small effects for field of view, and no meaningful effects for the g-seat factors and collective sound. Performance was better with the high-detail ship, the shorter visual lag, and the VTRS-wide field of view. Transfer-of-training research is recommended as the next step to further explore these findings and to obtain information directly relevant to the design of simulators for use by student pilots.

SIMULATOR DESIGN AND INSTRUCTIONAL FEATURES FOR CARRIER LANDING: A FIELD TRANSFER STUDY Final Report
D. P. Westra, G. Lintern, D. J. Sheppard, K. E. Thomley, and R. Mauk 18 Jun. 1986 91 p
(Contract N61339-85-C-0044)
(AD-A169962; NAVTRASYSCEN-85-C-0044-2) Avail: NTIS HC A05/MF A01 CSCL 01/2

A transfer-of-training experiment was conducted as part of the carrier landing behavioral research program at the Visual Technology Research Simulator (VTRS). Experimental results provide information on the design and use of simulators for training the aircraft carrier landing task and also provide input on design issues for the Navy's new T-45 training system. Two visual display variables and two simulator training variables were selected for inclusion in this experiment: scene detail (day contrasted with night); field of view (wide versus narrow); approach type (circling, modified straight-in or segmented); and number of simulator trials (20, 40, or 60). 72 student pilots were trained on the VTRS prior to going through the Field Carrier Landing Practice (FCLP) phase of their pilot training program. Performance of these students at FCLP was contrasted with that of a group of 54 students who did not receive simulator training. Results show that students trained in the simulator performed better at FCLP than the control students. There was no transfer advantage for those trained with a daytime high-detail scene compared to those trained with a lower cost nighttime low-detail scene. There was also no transfer advantage for those trained with a wide FOV compared to those trained with the wide field of view compared to those trained with the lower cost narrow FOV scene.

METER-LEVEL ORBIT DETERMINATION OF GEOSYNCHRONOUS SATELLITES BY AN ECONOMICAL TRACKING SYSTEM Ph.D. Thesis
TingHua Wang 1985 153 p
Avail: Univ. Microfilms Order No. DA8608651

A high-precision and low cost geosynchronous satellite tracking system was proposed. The tracking system main components are two geosynchronous satellites, four automatic ground stations and a very-long-baseline interferometry (VLBI) system. The automatic ground stations provide the doubly difference ranging measurements without precision clocks. The VLBI system consists of four one meter antennas positioned on orthogonal 6000 km baselines and uses a GPS signal for clock synchronization. A quick and simple initialization algorithm was developed to provide a reliable initial estimate. An efficient and stable two-stage Quasi-Newton-Raphson orbit determination program, in which the state perturbation transition matrix was introduced to simplify the mathematical derivation, always converges to the desired solution in five iterations. The artificial weighting matrices were carefully adjusted to desensitize the effect of the imperfection of measurements and modeling. An algorithm dependent linearized covariance method, based on batch-processing, weighted least-squares

estimation algorithm was derived and the error resulting from the process disturbances was evaluated carefully. Based on the anticipated characteristics of the 1990 era VLBI, doubly differenced ranging and dynamic model, a one meter position accuracy of geosynchronous satellites has been achieved. Dissert. Abstr.

Approximations are made to the point-mass equations of motion for flight within the atmosphere. Optimal controls are formulated for a reentry vehicle to execute a maximum-terminal-velocity turn to a specified heading while executing steep, descent trajectories. A Newton scheme is used repetitively to solve a nonlinear algebraic system for two parameters in the control equations to provide the on-line guidance. Trajectory comparisons from the repetitive solution of the optimal control problem, pure numerical optimization, and simulation of sample-data guidance show good agreement, if the atmospheric model is accurate. DOE

DIRECTORY OF RANGE DATA CONVERSION AND PROCESSING SYSTEM, REVISION
17 Jul. 1986 556 p
(AD-A169629; DR/CG-157-84-Rev) Avail: NTIS HC A24/MF A01 CSCL 09/2

The members and associate members of the Data Reduction and Computing Group (DR&CG) of the Range Commanders Council (RCC) have exchanged information on the hardware and software systems in use at their respective ranges and agencies at regular intervals with great success. Since other range representatives found this information to be valuable, the group published a Directory of Data Conversion and Processing Systems, RCC Document 127-73, in 1973. This third edition, 157-84, contains nine chapters, with information updated since the 1980 edition. The directory covers the following topics: range data conversion, processing systems, pre/post flight computer systems, real-time computer systems, film readers, frequency and wave analysis system, data transmission system, printers and plotters, range instrumentation computer systems, telemetry front and systems, terminals and graphic displays, micrographics equipment, embedded computer. An international research laboratory can be established on the Moon in the early years of the 21st Century. It can be built using the transportation system now envisioned by NASA, which includes a space station for Earth orbital logistics and orbital transfer vehicles for Earth-Moon transportation. A scientific laboratory on the Moon would permit extended surface and subsurface geological exploration; long-duration experiments defining the lunar environment and its modification by surface activity; new classes of observations in astronomy; space plasma and fundamental physics experiments; and lunar resource development. The discovery of a lunar source for propellants may reduce the cost of constructing large permanent facilities in space and enhance other space programs such as Mars exploration. DOE

SOLAR ARRAY FLIGHT DYNAMIC EXPERIMENT
Richard W. Schock Washington May 1986 27 p
(NASA-TP-2598; NAS 1.60:2598) Avail: NTIS HC A03/MF A01 CSCL 10A

The purpose of the Solar Array Flight Dynamic Experiment (SAFDE) is to demonstrate the feasibility of on-orbit measurement and ground processing of large space structures dynamic characteristics. Test definition or verification provides the dynamic characteristic accuracy required for control systems use. An illumination/measurement system was developed to fly on space shuttle flight STS-31D. The system was designed to dynamically evaluate a large solar array called the Solar Array Flight Experiment (SAFE) that had been scheduled for this flight. The SAFDE system consisted of a set of laser diode illuminators, retroreflective targets, an intelligent star tracker receiver and the associated equipment to power, condition, and record the results. In six tests on STS-41D, data was successfully acquired from 18 retroreflector targets and ground processed, post flight, to define the solar array's dynamic

characteristic. The flight experiment proved the viability of on-orbit test definition of large space structures dynamic characteristics. Future large space structures controllability should be greatly enhanced by this capability.

ADVANCED GUIDANCE ALGORITHMS FOR HOMING MISSILES WITH BEARING-ONLY MEASUREMENTS Annual Technical Report
Jason L. Speyer and David G. Hull 20 May 1986 10 p
(Grant AF-AFOSR-0371-84)
(AD-A170833; AFOSR-86-0595TR) Avail: NTIS HC A02/MF A01 CSCL 17/7

The research of this grant is directed toward the development of an advanced guidance system (navigation filter and guidance law) for a short-range air-to-air missile having a passive seeker (angle-only measurements). During this year, four subjects have been investigated. First, additional experience has been gained with the modified-gain extended Kalman filter; it is becoming apparent that it works the same as or better than the extended Kalman filter for the homing missile problem. Second, a new target-acceleration model has been developed to replace the first-order Gauss-Markov process normally used; this model allows target acceleration vector to rotate and keeps its magnitude within bounds. Third, because the homing missile problem with angle-only measurements is nonlinear, the guidance law affects the performance of the filter; a new guidance law based on maximizing a measure of the size of the information matrix has been developed and has been shown to improve filter performance. Fourth, a study of the use of new theory on fault detection has been initiated; the intent is to use this theory to detect target maneuvers (the target maneuver appears as a fault) so that the filter can be restarted.

DEVELOPMENT TESTING OF LARGE VOLUME WATE SPRAYS FOR WARM FOG DISPERSAL
V. W. Keller, B. J. Anderson, R. A. Burns, G. G. Lala (New Yor State Univ., Albany), M. B. Meyer, and K. V. Beard (Illinois Univ. Urbana-Champaign) Washington Jun. 1986 112 p
(NASA-TP-2607; NAS 1.60:2607) Avail: NTIS HC A06/MF A01 CSCL 14B

A new brute-force method of warm fog dispersal is described. The method uses large volume recycled water sprays to create curtains of falling drops through which the fog is processed by the ambient wind and spray induced air flow. Fog droplets are removed by coalescence/rainout. The efficiency of the technique depends upon the drop size spectra in the spray, the height to which the spray can be projected, the efficiency with which fog laden air is processed through the curtain of spray, and the rate at which new fog may be formed due to temperature differences between the air and spray water. Results of a field test program, implemented to develop the data base necessary to assess the proposed method, are presented. Analytical calculations based upon the field test results indicate that this proposed method of warm fog dispersal is feasible. Even more convincingly, the technique was successfully demonstrated in the one natural fog event which occurred during the test program. Energy requirements for this technique are an order of magnitude less than those to operate a thermokinetic system. An important side benefit is the considerable emergency fire extinguishing capability it provides along the runway.

ATTITUDE CONTROL OF AN ARTIFICIAL SATELLITE BY EXTENDING THE LINEAR QUADRATIC REGULATOR THEORY
Luiz Carlos Gadelha deSouza and Marcelo L. deOliveira e Souza Jul. 1986 8 p In PORTUGUESE; ENGLISH summary Presented at the 6th Congresso Brasileiro de Automatica, Belo Horizonte, Brazil, 25-28 Nov. 1986
(INPE-3959-PRE/977) Avail: NTIS HC A02/MF A01

A new attitude control law for artificial satellites is presented. It is based on an extension of the theory of linear quadratic regulator to the case where the dynamics is described by a weakly nonlinear system of equations (Euler's equations) with respect to a reference system fixed to the satellite. Only the phase in which the satellite has small angles and angular velocities is considered. During it the control law is approximately linear with respect to the state. The results obtained are partial (since this is on-going research), but suggest that: (1) the nonlinear terms of the equations are relevant in the initial instants only, but they become negligible later; (2) despite those terms, the implemented control law reduces the angular velocities and angles faster than other law already simulated with success; (3) that law permits an approximate calculation of the energy expended in the process. A PROCEDURE FOR ATTITUDE DETERMINATION OF ARTIFICIAL SATELLITES UTILIZING TECHNIQUES OF STATIC AND DYNAMIC OPTIMAL ESTIMATION
Sebastiao Eduardo Corsatto Varotto, Valcir Orlando, and Roberto Vieira daFonseca Lopes Aug. 1986 7 p In PORTUGUESE; ENGLISH summary Presented at the 6th Congresso Brasileiro de Automatica, Belo Horizonte, Brazil, 25-28 Nov. 1986
(INPE-3966-PRE/981) Avail: NTIS HC A02/MF A01

This work presents an algorithm for optimal attitude estimation of artificial satellites, suitable for real time applications. The attitude estimation at each sampling time is made in two phases. In the first one a preliminary estimation is obtained by a least squares method based only on instantaneous information from noninertial attitude sensors. This is made by using the algorithm known as QUEST (Quartenion Estimator). In the second phase, the preliminary estimate, after being conveniently treated, is used as an observation to be processed by a stochastic estimator: the extended Kalman filter. The procedure is tested by means of numerical simulation in a digital computer in a problem of three-axis attitude determination of an artificial satellite. This is a gravity gradient stabilized satellite which uses attitude sensors of two types; solar and magnetic. The analysis of the results shows good performance in terms of precision, robustness and processing time compared to direct application of an extended Kalman filter estimator. Author

PROCEDURE FOR ONE AXIS SATELLITES ATTITUDE CONTROL WITH MAGNETIC ACTUATION
Luiz Danilo Damasceno Ferreira, Valcir Orlando, and Atair Rios Neto May 1986 8 p In PORTUGUESE; ENGLISH summary Presented at the 2nd Congresso Latino Americano de Control Automatico, Argentina
(INPE-3895-PRE/937) Avail: NTIS HC A02/MF A01

The modelling and analysis phases of an attitude control system for low orbit artificial satellites using magnetic coil are presented. The function of the system is to maintain the satellite aligned with the local vertical. The control system development is considered through the application of stochastic control concepts. The satellite motion is described by the equations of motion based on Newtonian formulation. Starting from the Separation Principle, a sequential procedure is developed in which the state estimation and control problems are handled simultaneously. The state estimate is provided by Kalman filter by using the information about the positions of the satellite and of the coil parameters. The controller acts on the satellite in real time, since the coil is the only control element. Author

BRIEF ANALYSIS OF NORMAL ATTITUDE ACCURACIES OF

SATELLITES WITH WHEELS OR GAS JETS [BREVE ANALISE DAS PRECISOES EM ATITUDE NORMAL DE SATELITES COM RODAS OU COM JATOS A GAS]
Marcelo LopesdeOliveiraeSouza Sep. 1986 11 p In PORTUGUESE; ENGLISH summary
(INPE-3993-NTE/262) Avail: NTIS HC A02/MF A01

The normal attitude accuracies reached by some satellites using (reaction or momentum) wheels or (cold or hot) gas jets are briefly analyzed. To do so (in the available time), the data on some successfully launched satellites are compiled in 4 tables. From their analysis it is concluded that: (1) the use of wheels is a necessary condition (NC) for reaching high accuracies (less than or equal to 1'); (2) this does not happen with gas jets, whose use is not a sufficient condition(SC) either; (3) all the analyzed remote sensing (and predecessor) satellites use wheels, besides having circular, sun-synchronous and on-phase orbits; (4) these facts are extremely relevant for redefining the characteristics of MECB's Remote Sensing Mission (unless it were changed e.g., by a ANS-like one). A MATHEMATICAL FORMULATION OF A LARGE SPACE STRUCTURE CONTROL PROBLEM Interim Report
A. V. Balakrishnan Sep. 1985 8 p
(Grant AF-AFOSR-0318-83)
(AD-A169950; AFOSR-86-0444TR) Avail: NTIS HC A02/MF A01 CSCL 22/2

This paper presents an abstract-mathematical formulation of a Large Space Structure Control problem. The physical apparatus consists of a softly supported antenna attached to the space shuttle by a flexible beam-like truss. The control objective is to slew the antenna on command within the given accuracy and maintaining stability. The control forces and torques are applied at the shuttle end as well as the antenna end and in addition provision is made for a small number of 2-axis proof-mass actuators along the beam. The beam motion is modelled by partial differential equations. Of the variety of control problems possible we touch only on the time-optimal probable. Author (GRA)

SIMPLE DEFENSE CONSERVATIVE MODEL FOR MASS REQUIREMENTS OF HYPERVELOCITY PROJECTILE IMPACT SHIELDS FOR REENTRY VEHICLES
G. R. Spillman 1986 19 p Presented at the Hypervelocity Impact Symposium, San Antonio, Tex., 21 Oct. 1986
(Contract W-7405-eng-36)
(DE86-012407; LA-UR-86-2112; CONF-861091-1) Avail: NTIS HC A02/MF A01

Simple analytical modeling of the physics of interaction of hypervelocity (50 to 100 km/s) projectiles with a bumper shield countermeasure is given. The interaction of projectile and bumper expansion between bumper and underlying vehicle and interaction of bumper/projectile debris cloud with vehicle are examined. Projectile/bumper interactions are treated with ideal gas strong-shock and rarefaction equations. Projectile shock decay from bumper rarefaction is approximated by an impulsive shock similarity solution. A crude model for edge rarefactions is derived. Expansion of debris is treated as an expansion superimposed upon a translation with partition derived from a simple inelastic collision model. The effect of nonunity aspect ratio of compressed debris is included. Debris colliding elastically with the vehicle will impart momentum equal to twic[illegible] incident normal component. Impulse may be reduced up to [illegible] 2 by stagnation radiative losses for small projectiles ar[illegible] .iper/vehicle stand-off. Impulse can be enhanced by ve[illegible] on from radiative coupling, shock heating (inadequate stand-o[illegible] or liquid droplet microcratering (inadequate bumper thickness). Estimates of required bumper mass are given for a specific example. DOE

THE SPACE STATION MILLIMETER FACILITY
K. W. Weiler, B. K. Dennison, R. M. Bevilacqua, J. H. Spencer, and K. J. Johnston 9 Jun. 1986 58 p
(AD-A168983; NRL-MP-5794) Avail: NTIS HC A04/MF A01 CSCL 22/2

A large millimeter wavelength interferometer array is proposed for construction on the planned Space Station (The Space Station Millimeter Facility--SSMF). It will have manifold applications in both basic and applied research and will be the premier instrument in the world at high radio frequencies. Earth resource mapping, middle atmospheric studies, and high frequency radio astronomy are only a few of the areas which will be significantly advanced by the availability of such an instrument. Particularly in astronomy, the ability to do observations above the disturbing and absorbing effects of the Earth's atmosphere will allow opportunities for exploration of all objects from the Sun, through the Solar System bodies, to the interstellar medium of the Milky Way and other galaxies, and out to the most distant quasars with resolution and sensitivity equalling or exceeding all existing or planned millimeter wavelength telescopes. One of the last unexplored regions of the electromagnetic spectrum, the mm-IR gap, can finally be closed. A flexible design for the SSMF is proposed, and estimate of its construction costs is made, and numerous scientific applications in a number of disciplines are discussed. GRA

ADVANCED SOLAR DYNAMIC SPACE POWER SYSTEMS PERSPECTIVES, REQUIREMENTS AND TECHNOLOGY NEEDS
Miles O. Dustin, Joseph M. Savino, Dovie E. Lacy, Robert P. Migra (Sverdrup Technology, Inc., Arnold Air Force Station, Tenn.), Albert J. Juhasz, and Carolyn E. Coles 1986 30 p Proposed for presentation at the Solar Energy Conference, Honolulu, Hawaii, 22-23 Mar. 1987; sponsored by ASME, JSME and JSES
(NASA-TM-88884; E-3292; NAS 1.15:88884) Avail: NTIS HC A03/MF A01 CSCL 10B

Projected NASA, Civil, Commercial, and Military missions will require space power systems of increased versatility and power levels. The Advanced Solar Dynamic (ASD) Power systems offer the potential for efficient, lightweight, survivable, relatively compact, long-lived space power systems applicable to a wide range of power levels (3 to 300 kWe), and a wide variety of orbits. The successful development of these systems could satisfy the power needs for a wide variety of these projected missions. Thus, the NASA Lewis Research Center has embarked upon an aggressive ASD reserach project under the direction of NASA's Office of Aeronautics and Space Technology (DAST). The project is being implemented through a combination of in-house and contracted efforts. Key elements of this project are missions analysis to determine the power systems requirements, systems analysis to identify the most attractive ASD power systems to meet these requirements, and to guide the technology development efforts, and technology development of key components. SHIFTS IN SHUTTLE SRM PERFORMANCE BECAUSE OF AMMONIUM PERCHLORATE CRYSTAL SHAPE ON MISSIONS 51-I/J AND 61-A/B
Douglas L. Blackwell Aug. 1986 25 p
(NASA-TM-86561; NAS 1.15:86561) Avail: NTIS HC A02/MF A01 CSCL 21H

The design of the Space Shuttle vehicle configuration requires that the SRMs produce thrust within tightly-controlled limits. These limits provide assurance that Shuttle ascent performance goals will be achieved within the vehicle flight load constraints. The SRM's will perform within these limits if overall SRM reproducibility is maintained. This report will initially describe the excellent performance reproducibility of the 24 SRMs during the first 12 flights [STS-8 through STS-26 (Mission 51-F)] using the HPM SRM. Secondly, this report will describe the transient phenomena which interrupted the reproducibility in the first 20 sec of flight for four flights (Missions 51-I/J and 61-A/B). The cause of this 20 sec phenomena is postulated to be a change in the crystal shape of the ammonium perchlorate used in the propellant. This shape change coincided with the performance shift on these four flights. The ballistic effect of the crystal shape change is manifested as a change to the generic HUMP or BARF curve of the Shuttle SRM thrust/pressure-time curve. As the crystal shape change was corrected by the vendor, the performance produced by the Shuttle SRM returned to normal. Author

SSME MAIN INJECTOR 4000 HERTZ PHENOMENON Final Report, 22 Apr. - 21 Jul. 1986
G. D. Johnston 21 Aug. 1986 8 p
(NASA Order W-85081B)
(NASA-CR-178934; NAS 1.26:178934) Avail: NTIS HC A02/MF A01 CSCL 21H

Several Space Shuttle Main Engines (SSME) have experienced very high acceleration responses measured in the main injector of the powerhead during static firings. Data from previous hot fire SSME tests relating to the 4000 hertz phenomenon were reviewed to provide a better understanding of the nature of this structural response. The objective was to technically understand the way this phenomenon works, recommend a fix and test the fix. B.G.

HIGH VOLTAGE CHARACTERISTICS OF THE ELECTRODYNAMIC TETHER AND THE GENERATION OF POWER AND PROPULSION Final Report
P. Roger Williamson 23 Jan. 1986 15 p
(Contract NAS8-35502)
(NASA-CR-178949; NAS 1.26:178949) Avail: NTIS HC A02/MF A01 CSCL 10B

The Tethered Satellite System (TSS) will deploy and retrieve a satellite from the Space Shuttle orbiter with a tether of up to 100 km in length attached between the satellite and the orbiter. The characteristics of the TSS which are related to high voltages, electrical currents, energy storage, power, and the generation of plasma waves are described. A number of specific features of the tether system of importance in assessing the operational characteristics of the electrodynamic TSS are identified. B.G.

(Contract F04611-79-C-0039)
(AD-A169792; AFRPL-TR-86-044) Avail: NTIS HC A03/MF A01 CSCL 21/3

An in-situ method of measuring MPD (Magnetoplasmadynamic) thruster component erosion has been developed and tested on a reference multimegawatt thruster configuration. The technique involves activation of selected areas on the components to be studied by precisely controlled high energy (Me4V) ion beam bombardment. Monitoring the decrease in activity during thruster operation provides a precise (sub-micron accuracy), quantitative measure of the amount of material removed from the surface. In preliminary tests, erosion of the tungsten cathode occurred at all operating conditions, but a number of factors contributed to the lack of detectable erosion of the copper anode or the boron nitride insulator. These results tentatively indicate that cathode erosion is linearly related to the charge transfer, but scatter in the individual test sequence erosion rate data prevents a more definitive conclusion to be drawn at this time. Nevertheless, a comparison of erosion data obtained at two different pulse lengths (1 msec, 2 msec) indicates that cathode material loss is generally independent of the number of current transients. Work is continuing in a broad effort to refine the Surface Layer Activation (SLA) technique and to obtain a data base for additional thrusters. GRA

COMPUTATIONAL AND EXPERIMENTAL STUDY OF FLOW-INDUCED VIBRATION OF THE SSME MAIN INJECTOR POST
S. S. Chen, J. A. Jendrzejczyk, and M. W. Wambsganss 1986 25 p Presented at the Conference on Advanced Earth-to-Orbit Propulsion Technology, Huntsville, Ala., 13 May 1986
(Contract W-31-109-eng-38)
(DE86-012119; CONF-8605142-1) Avail: NTIS HC A02/MF A01

The Space Shuttle Main Engine (SSME) liquid-oxygen (LOX) posts are subjected to high-velocity turbulent flow from the transfer ducts. In a preliminary assessment of the vibration problem, it was determined that the two potential excitation mechanisms for LOX post vibration are fluidelastic instability and turbulent buffeting. A fundamental study is being conducted to understand the problem and to develop techniques to avoid detrimental vibrational effects with the objective of improving engine life. This paper summarizes the results of an analytical model for fluidelastic instability and test results for turbulent buffeting of a tube array in crossflow. A general theory of fluidelastic instability for a tube array in crossflow is presented. Various techniques to obtain the motion-dependent fluid-force coefficients are discussed and the general instability characteristics are summarized. The theory is also used to evaluate the results of other mathematical models for crossflow-induced instability. The fluid excitation forces acting on a tube array are presented as a function of Reynolds number, incoming flow conditions, and tube location in an array. The experimental data show the general characteristics of flow across a tube array. As the flow passes through each row of tubes, the fluid is subjected to resistance, the effect of which is to convert some of the fluid pressure energy to turbulent energy. In the first few rows, the transformation of energy occurs in a somewhat orderly manner. As the flow reaches the interior tubes, unsteadiness of the flow increases and, usually, a randomness of the flow and its pressure fluctuation exists in the flow field. DOE

These materials are artificially structured on the atomic scale and exhibit properties uniquely different than those found in naturally occurring or conventionally processed materials. Recent

advances in high vacuum deposition techniques have made these materials possible, since the manufacture of ASMs requires very clean environments and the capability to deposit layers with thicknesses ranging from fractions of a nm to a few nm. ASMs have been made from semiconductors, metals, metal-semiconductor combinations and metal-nonmetal combinations. The ASMs produced by layering high atomic number (Z) metals and low Z nonmetals or metals have unique X-ray interaction properties in that they can be used to produce normal incidence X-ray mirrors. It is the objective of this paper to review this new class of materials, with special emphasis on the high Z/low Z multilayer materials, describe applications for these materials currently in use for microanalysis and suggest future applications which should be considered by the X-ray microanalysis community. DOE

INVESTIGATION OF THE EFFECTS OF SHORT CHAIN PROCESSING ADDITIVES ON POLYMERS

Raj J. Singh, Terry L. StClair, and J. Richard Pratt Nov. 1986 10 p

(NASA-TM-89023; NAS 1.15:89023) Avail: NTIS HC A02/MF A01 CSCL 11D

The effects of low level concentrations of several short chain processing additives on the properties of the 4,4'-bis(3,4-dicarboxyphenoxy) diphenylsulfide dianhydride (BDSDA)/4,4'-diaminodiphenyl ether (ODA)/1,3'-diaminobenzene (m-phenylene diamine) (MPA) (422) copolyimide were investigated. It was noted that 5 percent MPD/phthalic anhydride (PA) is more effective than 1 percent ODA/PA and BDSDA/aniline (AN) in strengthening the host material. However, the introduction of 10 percent BDSDA/AN produces disproportionately high effects on free volume and free electron density in the host copolyimide. Author

(AD-A169186; MCR-85-605-ISSUE-3) Avail: NTIS HC A02/MF A01 CSCL 11/4

Fiber reinforced metal matrix composites (MMC) are candidate structural materials for space applications because of their high specific modulus, low CTE, high electrical and thermal conductivity and high environmental resistance. Furthermore, the need for dynamic dimensional precision and weight savings in space structures suggests inherent material damping as an additional property requirement. A preliminary investigation indicates MMC exhibit improved damping with respect to conventional structural alloys of aluminum or titanium. In the present investigation, a graphite-aluminum composite (P55/6061) has been selected to study the microstructural features and mechanisms responsible for damping in MMC. The objectives for this reporting period have been as follows: establish a reliable test method and its limitations; develop reproducible damping test data at different frequencies and strain amplitude; thorough metallurgical characterizations of interfaces; suggest an operative damping mechanism in MMC; and recommendations for further investigations. STRESS EFFECTS ON MOISTURE TRANSPORT IN AN EPOXY RESIN AND ITS COMPOSITE

Y. Weitsman and M. Henson Jun. 1986 11 p

(Contract N00014-82-K-0562)

(AD-A169306; MM-4762-86-15) Avail: NTIS HC A02/MF A01 CSCL 11/4

This paper presents the results of a experimental investigation of stress effects on the sorption of water vapor in an epoxy resin and its composite. Such effects were noted by several researchers in both polymers and composites, although these earlier investigations did not present a comprehensive study of the phenomenon. This paper summarizes results which were obtained recently. It is shown that in both epoxy and graphite/epoxy composites, external stresses affect the diffusion process. In the case of the resin, stresses appear to raise the moisture saturation levels while in composites stresses appear to affect the entire sorption process, accentuating the a-symmetries between absorption and desorption behavior. In both materials the moisture transport process departs both quantitatively and qualitatively from the predictions of classical, Fickean diffusion. GRA

MECHANICAL TESTING OF A COATED CARBON-CARBON COMPOSITE AT ELEVATED TEMPERATURES IN AIR Final Report

George D. Quinn and Jacob J. Stiglich, Jr. May 1986 24 p

(AD-A169355; MTL-TR-86-15) Avail: NTIS HC A02/MF A01 CSCL 11/4

The controlled nucleation thermochemical deposition (CNTD) process can apply a silicon carbide coating to carbon/carbon (C/C) composites. Coated C/C composite materials are potentially useful in advanced gas turbine engines particularly as static components, although rotating components are feasible. Success of such a system will require a coating that will ensure oxidation resistance and mechanical integrity. This report represents a preliminary characterization of mechanical properties of a silicon carbide coated, C/C composite at ambient and elevated temperature in air. The coating was applied by the controlled nucleation thermochemical deposition (CNTD) process. The strength, static fatigue, and oxidation results of the coated composite were favorable at temperatures up to 2372 F (1300 C) in air. GRA

COUPLED DAMAGE AND MOISTURE-TRANSPORT IN FIBER-REINFORCED POLYMERIC COMPOSITES
Y. Weitsman Jan. 1986 50 p
(Contract N00014-82-K-0562)
(AD-A169379; MM-4762-86-2) Avail: NTIS HC A03/MF A01 CSCL 11/4

This paper presents a mathematical model for the coupling between moisture diffusion and damage in fiber-reinforced, polymeric composites. In these materials, moisture was observed to cause damage by a multitude of minute debondings at the fiber/matrix interfaces. The model employs concepts of continuum damage theory to describe those debondings. Formal evolutionary expressions are derived and related to the extent of damage, the stress field, moisture content and moisture gradient. The effects of damage on moisture diffusion and on reductions in moduli are aslo formulated. Qualitative comparisons with experimental results are provided. GRA

MICROMECHANISMS OF CRACK GROWTH AND FRACTURE TOUGHNESS IN METAL MATRIX COMPOSITES Technical Report, 29 Apr. 1985 - 29 Apr. 1986
D. L. Davidson, J. Lankford, and G. R. Leverant Jun. 1986 47 p
(Contract N00014-85-C-0206)
(AD-A169839; SWRI-06-8602) Avail: NTIS HC A03/MF A01 CSCL 11/4

Subcritical crack growth and rapid fracture of the mechanically alloyed aluminum alloy IN-9052 reinforced with SiC particles have been investigated. Fatigue crack growth rates for the composite exceed those of the unreinforced alloy, except that the threshold stress intensity for growth is higher for the composite. Fracture toughness of the composite is about 9 square root of M cubed compared to a (reported) value of 29 square root of M cubed for the unreinforced alloy. The contributions to fracture toughness from work done within the plastic zone and in formation of the void sheet have been computed using analytical models. Fracture toughness is shown to result almost entirely from work done within the plastic zone of the growing crack. The matrix microstructure and the particulate characteristics are found to account for the elastic and fracture properties of this composite. GRA

PROCESS FOR CARBON-CARBON COMPOSITE FABRICATION Patent Application
Plotzker, inventor (to Air Force) et al Filed 16 Apr. 1986 16 p
(AD-D012413; US-Patent-Appl-SN-852597) Avail: NTIS HC A02/MF A01 CSCL 11/4

A fabrication process and apparatus are disclosed that achieve a higher density carbon-carbon article, than the prior art processes by maintaining a vertical temperature gradient in a reservoir of pitch (e.g., 550 C at the bottom to 250 C at the top) into which a carbon fiber preform is immersed. The use of the vertical temperature gradient results in a reservoir of hot fluid pitch around the upper end of the preform during pitch impregnation of the preform. This permits the fluid pitch to drain down by gravity into the interstices of the carbon fiber and the hardening pitch below. The next step of the process involves gradually increasing the pitch-hardening temperature from bottom to top to harden the pitch from bottom to top. Thereafter, the impregnated preform is carbonized at high temperature. This method takes advantage of the thermal conductivity of the carbon fibers and does not require extremely high pressures. In fact, a high pressure would be a detriment since it results in closed pores. The process of the present disclosure depends on the development of large, connected pores that can be more easily filled. This manner results in the production of suitable carbonized billets in a fraction of the time currently required and using much less energy. GRA

CARBON FIBERS
A. A. Konkin and N. F. Konnova 22 Aug. 1986 35 p Transl. into ENGLISH from Zhurnal Vsesoyuznogo Khimicheskogo Obshchestva (USSR), v. 17, no. 6, 1972 p 632-639
(AD-A171370; AD-F250645; FTD-ID(RS)T-0761-86) Avail: NTIS HC A03/MF A01 CSCL 11/2

In connection with development of missile construction, aircraft construction, mastery of space, and also other branches of technology arose acute need for high temperature (oxidation resistant) fibrous materials, reinforced plastics on basis of which were intended for exploitation at high temperatures. Common natural and synthetic fibers, including thermoresistant, could not satisfy these requirements. As a result of intensive investigations, carried out for latter by decade are developed methods of obtaining large number of high temperature (oxidation resistant) fibers different in properties, predominantly on basis of inorganic compounds. To the important of them relate carbon, boric, carbide, metallic, on the basis of oxides of the elements and some other compounds. Filamentary crystals (whisker) occupy special position in view of unique mechanical properties. This group of fibers is located on different levels of technical development. GRA

STABILITY OF MULTILAYERS AT HIGH TEMPERATURES
E. Ziegler, Y. Lepetre, I. K. Schuller, and E. Spiller (IBM Watson Research Center, Yorktown Heights, N.Y.) 1986 10 p Presented at the SPIE Technical Symposium on Applications of Artificial Intelligence, Orlando, Fla., 31 Mar. 1986 Prepared in cooperation with IBM Watson Research Center, Yorktown Heights, N.Y.
(Contract W-31-109-eng-38)
(DE86-010526; CONF-860366-7) Avail: NTIS HC A02/MF A01

The temperature stability of metal (W, WRe, Co, Cr)-carbon multilayers has been studied using X-ray diffraction (theta-2theta and Debye-Scherrer) and electron microscopy. Results show that in all cases a crystallization occurs in the temperature range 650 to 750 C. As a consequence of this crystallization, the layered structure is destroyed, the surface of the film becomes rough and the X-ray reflectivity is considerably reduced. These results imply that efficient cooling or new multilayer structures will have to be developed for use at high temperatures or under high X-ray incident flux. DOE

VAPOUR PRESSURES AND CRITICAL POINTS OF LIQUIDS. PART 2C: ALKADIENES AND ALKYNES
Feb. 1986 60 p
(ESDU-86001-Pt-2C; ISBN-0-85679-553-4; ISSN-0141-4062) Avail: ESDU

This Data Item ESDU 86001 is an addition to the Physical Data, Chemical Engineering Sub-series. Vapor pressure data are given for 36 compounds. The data were obtained by a method described in ESDU 84021 involving a critical evaluation of experimental results in the literature, extrapolated by a recent reliable method into the low pressure region, and fitted by a Wagner equation applying over the full liquid range from the freezing to the critical point. The coefficients of the equation are given for each compound and three tables of vapor pressure are included: in SI units at 5 K intervals, in atmospheres at 5 C intervals, and in lbf/sq in at 10 F intervals. The sources of the data used are listed, and a table gives likely uncertainties in values predicted by the equation that should be allowed for in any critical situation. Critically evaluated vapor pressure data for alkanes are available in ESDU 84022, 84028, and 85002 and for alkenes in ESDU 85008 and 85016. ESDU

CELLULAR SOLIDIFICATION OF TRANSPARENT MONOTECTICS Semiannual Report
William F. Kaulker Dec. 1986 12 p
(Grant NAG8-069)
(NASA-CR-177039; NAS 1.26:177039) Avail: NTIS HC A02/MF A01 CSCL 07D

Understanding how liquid phase particles are engulfed or pushed during freezing of a monotectic is addressed. The additional complication is that the solid-liquid interface is nonplanar due to constitutional undercooling. Some evidence of particle pushing where the particles are the liquid phase of the monotectic was already observed. Cellular freezing of the succinonitrile-glycerol system also occurred. Only a few compositions were tested at that time. The starting materials were not especially pure so that cellular interface observed was likely due to the presence of unkown impurities, the major portion of which was water. Topics addressed include: the effort of modeling the particle pushing process using the computer, establishing an apparatus for the determination of phase diagrams, and the measurement of the temperature gradients with a specimen which will solidify on the temperature gradient microscope stage. RELATIONSHIP OF IN-CYLINDER GASEOUS AND PARTICULATE CONCENTRATION TO RADIATIVE HEAT TRANSFER IN DIRECT INJECTION-TYPE DIESEL COMBUSTION Final Report, 1 Feb. 1983 - 31 Jan. 1986
K. T. Rhee, S. L. Chang, Jeff Matonick, and Chirs Sheft 15 Apr. 1986 135 p
(Contract DAAG29-83-K-0042)
(AD-A168979; ARO-19869.13-EG) Avail: NTIS HC A07/MF A01 CSCL 21/2

The objective of the reported research was to investigate the relationship of radiation heat transfer to the in-cylinder species distribution in direct injection-type diesel engine combustion. In order to implement this objective, both the experimental and computational methods were employed during the course of the study. In the experiment, in order to obtain the in-cylinder species distribution at successive engine crank angles, a rapid sampling valve has been used on a laboratory-built single cylinder direct injection-type diesel engine. The engine for the data acquisition was constructed basically by combining a reciprocating system of an ASTM gasoline engine and a newly constructed engine cylinder head. We encountered a series of problems in the engine requiring replacement of engine components. At the end, the engine was regarded unable to meet the need of operating for an extended period of time for data gathering. Consequently, it was decided to use a new single cylinder engine. In the computational work, a radiation heat transfer model was developed to predict spectral radiation heat transfer through the engine combustion chamber wall for given in-cylinder species distributions. The discovery of a new integral function, a new exact solution of blackbody functions, a new empirical equation of adiabatic flame temperature of fuel/air systems, an analytical solution of equation of radiation functions, a parametric analysis of diesel radiation heat transfer, etc. are reported. OPTICAL SPECTROSCOPY OF DYNAMICALLY COMPRESSED LIQUIDS Final Report, 1 Apr. 1977 - 30 Jun. 1986
George E. Duvall 30 Jun. 1986 42 p
(Contract N00014-77-C-0232)
(AD-A169013; SDL-0058-FTR) Avail: NTIS HC A03/MF A01 CSCL 07/4

The objectives of this work are described in the Introduction. Accomplishments are listed and experimental approaches are described briefly. A summary is given of spectroscopy experiments in CS2 and other materials. Conclusions are: (1) there is no evidence in CS2 of an unique shock effect other than that resulting from rapid increase of pressure and temperature which accompanies compression, (2) metastable states, which can be sampled only by rapid compression, are achieved in these experiments, (3) chemical reaction rates can be measured and critical pressures and temperatures can be determined from spectral measurements in this regime, (4) changes in the UV and visible spectra of liquids studied vary from no observable effect to shifts of thousands of angstroms in absorption band edges for pressure less than 130 kbars, (5) observed spectral changes in liquid CS2 are cooperative in nature and become very small or zero at infinite dilution, (6) a combination of static high pressure and shock compression measurements is particularly valuable in unravelling the physical processes, involved, (7) shock experiments appear to represent a particularly useful adjunct to and extension of chemical processes in liquids under conditions of high temperatures and pressures. Pattern recognition methods were used to evaluate the information content of mass spectrometry data obtained using transition metal ions as an ionization source. Data sets consisting of the chemical ionization mass spectra for Fe+ and Y+ with 72 organics (representing the six classes alkane, alkene, ketone, aldehyde, ether, and alcohol) and 24 alkanes (representing the three subclasses linear, branched, and cyclic) were subjected to pattern recognition analysis using a k-nearest neighbor approach with feature weightings. The reactivities of Fe+ and Y+ toward

the classes of compounds studied were characterized using classification accuracies as a measure of selectivity, and important chemical information was extracted from the raw data by empirical feature selection methods. A total recognition accuracy of 81% was obtained for the recognition of the six organic classes and 96% accuracy was obtained for the recognition of the three subclasses of alkanes. GRA

ELECTRODE/ELECTROLYTE INTERPHASE STUDY USING POLARIZATION MODULATED FT-IR REFLECTION ABSORPTION SPECTROSCOPY
K. Kunimatsu, H. Seki, W. G. Golden, J. G. Gordon, II, and M. R. Philpott 16 May 1986 24 p
(Contract N00014-82-C-0583)
(AD-A169081; TR-9) Avail: NTIS HC A02/MF A01 CSCL 07/4

The polarization modulated Fourier transform infrared reflection-absorption spectroscopy (FT-IRRAS) is applied to the studies of adsorption and oxidation of CO on a platinum electrode in 0.5M sulfuric acid and of adsorption of cyanide on gold and silver electrodes in 0.5M sulfuric potassium sulfate. The absorption intensity of the CO on platinum electrode is ca. 4 to 5% while that of the CN(-) on silver and gold is 0.2 to 0.5%. The potential dependence of the vibrational spectra was observed for both systems. Oxidation of the linearly adsorbed CO layer proceeds by different mechanisms depending on whether CO was adsorbed at a potential in the double layer region or in the hydrogen region, i.e., at the edges of the CO islands in the former case and randomly in the latter case, in which the bridged CO species plays an important role. The vibrational frequency of the linearly adsorbed CO changes linearly with potential at a rate of 30 cm-1/volt, which is independent of anion specific adsorption. The origin of the shift is most reasonably explained by the first order Stark effect. For Ag, Au/CN(-) systems, the surface cyanide species is the linearly adsorbed CH(-). The anodic reaction products in the solution from cyanide ions and the electrode are also observed in the vibrational spectra. The bands due to surface species and those due to solution species are distinguished by measuring the spectra with s and p-polarized lights. GRA

CARBON MONOXIDE ADSORPTION ON A PLATINUM ELECTRODE STUDIED BY POLARIZATION MODULATED FT-IR REFLECTION-ABSORPTION SPECTROSCOPY. 2: CO ADSORBED AT A POTENTIAL IN THE HYDROGEN REGION AND ITS OXIDATION IN ACIDS
K. Kunimatsu, H. Seki, W. G. Golden, J. G. Gordon, II, and M. R. Philpott 16 May 1986 22 p Submitted for publication
(Contract N00014-82-C-0583)
(AD-A169082; TR-10-Pt-2) Avail: NTIS HC A02/MF A01 CSCL 07/4

The carbon monoxide layer on a platinum electrode, which is adsorbed at 0.05 V relative to a normal hydrogen electrode (NHE) in 0.515 M sulfuric acid, and its oxidation to carbon dioxide at higher electrode potentials has been studied by both electrochemical and in-situ Fourier transform infrared reflection-absorption spectroscopy (FT-IRRAS). Polarization modulated FT-IRRAS was used to measured the vibrational spectra of adsorbed carbon monoxide as well as the evolved CO2 as a function of electrode potential. It is shown that the dominant surface species is linearly adsorbed CO, but that the bridge bonded species is oxidized first at about 0.20 V, giving rise to a decrease in the linear C-O stretching frequency of along with a broadening of the band. Oxidation of the linearly adsorbed CO begins at 0.35 V, producing a further, sharp decrease in the C-O stretching frequency as well as a considerable broadening of the band. It is concluded that the oxidation of the CO adlayer produced at 0.05 V occurs randomly throughout the adlayer, in contrast to oxidation at island edges, which is characteristic of CO adsorbed at 0.4 V. It is proposed that the difference in behavior of these two kinds of adsorbed CO is due to crystallographic modification of the platinum surface surface when the CO is adsorbed at 0.05 V in the hydrogen region which results in a higher density of bridge bonded CO. ELECTROCHEMISTRY IN NEAR-CRITICAL AND SUPERCRITICAL FLUIDS. 3: STUDIES OF Br(-), I(-) AND HYDROQUINONE IN AQUEOUS SOLUTIONS
William M. Flarsheim, Yu-Min Tsou, Isaac Trachtenberg, Keith P. Johnson, and Allen J. Bard Feb. 1986 37 p
(Contract N00014-84-K-0428)
(AD-A169138; TR-3) Avail: NTIS HC A03/MF A01 CSCL 07/4

A new type of apparatus has been constructed for carrying out electrochemistry in nearcritical and supercritical aqueous solutions. The following systems have been studied at a platinum electrode: H2O/O2, I(-)/I2, Br(-)/Br2, and hydroquinone/benzoquinone. The compact, alumina flow-cell can be heated or cooled quickly, and can be recharged with fresh electrolyte solution while at high temperature and pressure. A large reduction in the potential required for the electrolysis of water was observed. Diffusivities have been measured for iodide ions and hydroquinone. General agreement with the Stokes-Einstein model was observed in the temperature range 25 C to 375 C. GRA

NEW RESULTS ON LOW TEMPERATURE THERMAL OXIDATION OF SILICON Interim Report
E. A. Irene 20 Jun. 1986 36 p
(Contract N00014-83-K-0571)
(AD-A169603; TR-5) Avail: NTIS HC A03/MF A01 CSCL 07/4

The commonly accepted linear-parabolic oxidation model for the thermal oxidation of Si includes two rate processes in a steady state: reaction between Si and oxidant at the Si-SiO2 interface; and transport of oxidant through the SiO2 film. Based on available data, it is argued that the former process seems dominant for thin film growth in dry O2. A number of measured SiO2 film and Si-SiO2 interface measured properties are reported, as well as the variation of these properties with oxidation temperature and Si substrate orientation. These properties include; refractive index, density, intrinsic stress, interface fixed oxide charge and interface trapped charge. It is also observed that all of these properties display similar oxidation temperature and inert anneal behavior plus a complex orientation dependence. Through the use of a modified form for the interface reaction, a better understanding is obtained of both the origin of these measured properties, and new oxidation data taken on five Si orientations and at lower oxidation temperatures than previously reported. INVESTIGATION OF DEVIATIONS FROM IDEALITY IN THE TWO LIQUID PHASE REGION OF SYSTEMS OF MEDIUM MOLECULAR WEIGHT HYDROCARBON MIXTURES AND WATER Final Report, 1 Jan. 1983 - 31 Dec. 1985
David R. Burris and William G. MacIntyre Feb. 1986 115 p
(Grant AF-AFOSR-0036-83)
(AD-A169752; AFOSR-86-0397TR) Avail: NTIS HC A06/MF A01 CSCL 07/4

Two-phase systems of liquid hydrocarbon mixture, containing medium molecular weight aromatic and aliphatic hydrocarbons, and water were examined in both equilibrium and kinetic experiments. Knowledge of the aqueous solution behavior of liquid hydrocarbon mixtures is important in determining the fate of hydrocarbon components of fuels and petroleum in environmental release situations. The equilibrium solute concentration for a component is given by the product of the pure compound solubility, its mole fraction in the hydrocarbon phase and its activity coefficient in the hydrocarbon phase. Hydrocarbon phase activity coefficients determined for binary hydrocarbon mixtures using static vapor pressure measurements (at 20 and 70 degs.) and those determined using water solubility results (at 20 and 70 degs.) did not differ significantly. This indicated that component aqueous phase

ctivity coefficients did not decrease measurably in the presence of hydrocarbon co-solutes, in contradiction to some previously published observations, and that the presence of water in the hydrocarbon phase was not significant at these temperatures. Methods for predicting multicomponent mixture solubilities were demonstrated. Aqueous solution behavior of mixtures containing a chlorinated hydrocarbon or a fatty acid surfactant was also determined. GRA

ON THE INTERPLAY BETWEEN CHEMICAL REACTIONS AND PHASE TRANSITIONS FOR MOLECULES ADSORBED ON SOLID SURFACES
Mark Stiles and Horia Metiu Jul. 1986 28 p Prepared in cooperation with Cornell Univ.
(Contract N00014-82-K-0576)
(AD-A169818; TR-25) Avail: NTIS HC A03/MF A01 CSCL 07/4

There is a large body of experimental evidence suggesting that the rate of product formation in a reaction between adsorbed molecules is deeply modified when one of the reagents undergoes a phase transition or, more broadly speaking, an aggregation of some kind. Specific examples are H2 and CO oxydation; methanol transformation into a methoxy radical on O/Cu; the water reaction with oxygen to form 20H; the decomposition of N2O on Pt(111) which is affected by a phase transition in the outermost Pt layer; and the oxidation of Ni. It is suspected that similar effects might operate on supported metal catalysts. We use Monte Carlo simulations to examine the manner in which reagent aggregation affects the reaction rate between molecules adsorbed on a solid surface. We discuss the temperature and concentration dependence of the rate of product formation. GRA

IMPORTANCE OF INTERFACIAL PHENOMENA IN SEPARATION SCIENCE AND TECHNOLOGY
C. D. Scott 1986 13 p Presented at the Interfacial Phenomena in the New and Emerging Technologies, Boulder, Colo., 29 May 1986
(Contract DE-AC05-84OR-21400)
(DE86-011063; CONF-8605119-1) Avail: NTIS HC A02/MF A01

The different types of separation technologies have many common features that can be used to define a unified field. All separation processes bring about a spatial differentiation of the components of a mixture. In most cases, the separation is conducted in a heterogeneous process which requires the movement of the component of interest to, or through, an interface between phases. Thus, interfacial phenomena will frequently represent important, or even controlling, mechanisms in the separation process. There will be important needs and opportunities for interfacial research in support of advanced separation concepts. Some of these needs will be pointed out for selected areas of new or emerging technologies. DOE

We have tested our improved NMR method for determining diffusion coefficients using a sample of HO. We obtain the literature value for D to within the error of the experiment (+3%). This NMR diffusion experiment now allows us to obtain diffusion data for the naphthalene-CO system. Spin echo modulation is no longer a problem, so we may monitor the proton NMR signal from naphthalene which has the necessary sensitivity to obtain diffusion data. Diffusion measurements are now in progress. These are the first NMR diffusion measurements on a solid-supercritical fluid system. We have recently been testing the feasibility of obtaining high resolution sulfur-33 NMR spectra of solids containing sulfur dissolved in supercritical fluids. Typically sulfur linewidths in these molecules are very large (greater than 10kHz) when dissolved in liquid solution. However, the viscosity of a supercritical fluid is much less than that of a simple liquid, and thus a sulfur containing compound dissolved in a supercritical fluid should have a greatly narrowed linewidth. This would allow the characterization of sulfur containing coal liquids, for example. We have investigated the system dibenzothiophene-supercritical ethylene in this way. Unfortunately, the NMR sensitivity of ^{33}S is quite poor, and the signal to noise ratios were not sufficient to obtain the spectrum. DOE

A detailed understanding of the chemical nature of surface impurities and overlayers is critical to many technologically important phenomena. Modern surface spectroscopies provide us with the capability to probe many subtleties of surface/adsorbate systems and have proved to be invaluable to the development of our understanding of surface catalyzed reactions and related phenomena. This paper illustrates this point with two specific examples, the production of surface carbon in catalytic methanation over nickel and the modification of electronic properties of copper by an underlying ruthenium substrate. ELECTRON MICROPROBE ANALYSIS: THE UPPER LIMIT OF SUBMICRON SPECTROSCOPY
P. F. Hlava and W. F. Chambers 1986 5 p Presented at the Annual Joint Meeting of the Electron Microscopy of America and the Microbeam Analysis Society, Albuquerque, N. Mex., 10 Aug. 1986
(Contract DE-AC04-76DP-00789)
(DE86-009540; SAND-86-0921C; CONF-860829-18) Avail: NTIS HC A02/MF A01

In the electron microprobe, a beam of high energy electrons is focussed to a fine point on the surface of a fairly thick specimen and the X rays produced are analyzed to determine the chemistry of the point. The spacial resolution of this instrument for chemical analysis, then, is defined by the volume of material from which the X ray signal originates. This, in turn, is related to factors such as the diameter of the electron beam, the spreading of the electron beam as it penetrates into the sample and interacts with the atoms of the sample to generate X rays, and the extent to which these primary X rays penetrate beyond the region of electron beam interaction and generate secondary X rays by the process of fluorescence. Beam voltage, current, and diameter can all be easily controlled by the analyst. Once the electrons enter the specimen, however, the analyst loses control of their density. Each individual electron follows a unique, erratic path as it passes near, passes through, or collides with parts of the atoms in the specimen. Monte Carlo calculations are a means by which many investigators have tried to model the paths of individual electrons and the interaction volume that large numbers of such electrons define. DOE

OPTICAL DIAGNOSTICS FOR DIESEL ENGINE APPLICATIONS Final Technical Report
G. M. Dobbs and J. J. Sangiovanni Nov. 1985 108 p
(Contract DE-AC04-83AL-23523)
(DE86-010747; DOE/AL-23523/T1) Avail: NTIS HC A06/MF A01

Investigations have been conducted on the applicability and limitations of Coherent anti-Stokes Raman Spectroscopy (CARS) measurement of temperature and species concentration, and

laser light scattering/extinction measurement of soot number density and particle size, to diesel combustion. Experiments were conducted under simulated diesel conditions in high-pressure laminar diffusion flames and in a simulated droplet environment. Consideration was given to the effect of the presence of soot particles, fuel droplets, or fuel-rich vapor on the laser-diagnostic techniques. Problems which arise in making CARS measurements of temperature or species concentration under severely sooting conditions were studied in high-pressure flames. A new absorption interference was noted which was assigned to absorption by the C produced by ablation of soot particles by the incident laser beam. CARS conditional sampling strategies for simultaneously determining temperature and whether fuel or soot was present during a combustion event were conceived and experimentally investigated. The light scattering from fuel droplets as an interference to the measurement of accurate soot size and number density distribution parameters was studied in a droplet apparatus. A critical review of the effects of multiple scattering processes on laser light extinction/scattering in diesel combustion was conducted.

PHASE EQUILIBRIUM PREDICTIONS FOR POLAR AND HYDROGEN BONDING MIXTURES
M. D. Donohue, P. Vimalchand, and G. D. Ikonomou 1986 9 p
(Contract DE-AC02-81ER-10982)
(DE86-011812; DOE/ER-10982/T1) Avail: NTIS HC A02/MF A01

The Perturbed-Hard-Chain Theory (PHCT) has been generalized to treat pure compounds and mixtures with polar forces (dipoles and quadrupoles) as well as hydrogen bonding. The generalization to polar compounds is based on the perturbation expansion for anisotropic molecules by Gubbins and coworkers. The effects of hydrogen bonding are taken into account using an approach similar to that of Heidemann and Prausnitz. With these two generalizations, accurate mixture VLE and LLE predictions can be made, even for highly non-ideal systems, using pure component parameters alone.

DOUBLE-RESONANCE TECHNIQUES FOR HIGH-RESOLUTION RAMAN-SPECTROSCOPY
P. Esherick and A. Owyoung 1986 3 p Presented at the 10th International Conference on Raman Spectroscopy, Eugene, Ore., 31 Aug 1986
(Contract DE-AC04-76DP-00789)
(DE86-009640; SAND-86-0959C; CONF-860853-1) Avail: NTIS HC A02/MF A01

In an effort to improve the sensitivity of coherent Raman spectroscopies we have been investigating double-resonance techniques that can combine the high-resolution of stimulated Raman spectroscopy with the sensitivity of electronically resonant spectroscopies such as multiphoton ionization. One such technique that has been highly successful in our laboratory is ionization detected stimulated Raman spectroscopy (IDSRS). In IDSRS, resonant laser ionization is used to detect vibrationally excited molecules produced via stimulated Raman pumping. In a two-step process molecules are first excited to v = 1 levels via a driven stimulated Raman transition. Following this the rotational/vibrational distribution is probed with resonant laser ionization by a tunable UV source. Raman spectra are then obtained by scanning the frequency of one of the Raman pump sources and monitoring the ionization signal as a function of the frequency difference (Stokes shift) between this laser and the second, fixed-frequency, visible pump laser.

(Contract DE-AC04-76DP-00789)
(DE86-012926; SAND-86-0840) Avail: NTIS HC A04/MF A01

A detailed examination has been made on the use of the comparative method for measuring the thermal conductivity of solid materials. Existing data analysis methods are discussed and new techniques, based on generalized linear least squares methods, are presented. An error analysis is made to determine the potential accuracy, reproducibility, and repeatability of the technique. For the case in which the reference conductivity is known to a relative accuracy of +-5%, the overall relative accuracy of the measurement is shown to be about +-6%. Experimental data are presented for the conductivities of commonly used reference materials; Pyrex 7740, Pyroceram 9606, Inconel 718, and Armco iron. Data are also given for two potential reference materials: fused silica and 304 stainless steel.

NEUTRON DIFFRACTION STUDIES OF SOME RARE EARTH-

TRANSITION METAL DEUTERIDES Final Report, 15 Nov. 1983 - 1 Dec. 1985
William J. James May 1986 92 p
(Contract DAAG29-83-K-0159)
(AD-A168995; ARO-19783.4-MS) Avail: NTIS HC A05/MF A01 CSCL 11/6

Neutron diffraction experiments were performed on Ho6Mn23. At 77K it is found to have a face-centered cubic crystal structure and a non-collinear magnetic structure, with the Ho moments tilted at an angle of 33.4 to the Mn moments. The Ho atom carries a moment of 3.8 mu sub B, while the Mn moments at the b, d, f sub 1 and f sub 2 sites are 2.1, 2.0, 2.2 and 1.9 mu sub B respectively, comparable to those found in Y6Mn23. The very low moment on the Ho atom is rationalized as resulting from the fanning of the weakly coupled rare earth moments around the net Ho moment direction, giving a low spatially averaged value. Neutron diffraction studies of three Y6(Fe1-xAlx)23 compounds (x=0.05, 0.10, 0.15) at 523K and 77K reveal substantial preferential atomic ordering of Fe and Al atoms on the four transition crystallographic sites. The Fe atoms exhibit different magnetic moments on the four sites. The ternary alloys, Y6(FexMn1-x)23, exhibit interesting magnetic behavior over a range of solid solutions of iron and manganese. The effects of the substitution of Fe by Al in the R2 (Fe1-xAlx)14B compounds (R = Y, rare earths) on their magnetic properties have been investigated. The present experimental data indicate that intermetallic compounds based on Nd2(Fe1-x-yAlxCoy) 14B have both high Curie temperatures and high coercive fields. The magnetocrystalline anisotropy of (Nd1-xSmx)2Fe14B and (Nd1-xPrx)2Fe14B has been studied by X-ray and magnetic measurements. GRA

THE INFLUENCE OF WELDING FLUX ON THE PYROMETALLURGICAL, PHYSICAL AND MECHANICAL BEHAVIOR OF WELD METAL Final Report, 15 Feb. 1983 - 14 Feb. 1986
David L. Olson 15 May 1986 24 p
(Contract DAAG29-83-K-0046)
(AD-A169067; MT-CWR-086-017; ARO-20174.12-MS) Avail: NTIS HC A02/MF A01 CSCL 11/6

The pyrochemical behavior of submerged arc welding flux was investigated. The nature of the pyrochemical reactions are described. Mechanistic models for the pyrochemical behavior are suggested. The submerged arc welding was performed on both low carbon and high strength low alloy steels. Both thermodynamic and kinetic models are discussed. Ferrous weld metal phase transformations were investigated. The role of weld metal oxygen, weld metal inclusion and strain on the formation of acicular ferrite was characterized, analyzed and modeled. Advanced high purity - homogeneous multi-component welding fluxes were made using the sol gel process for making glass. These sol gel fluxes were used to make flux cored wires. The sol gel filled flux cored wires were used to weld microalloyed HSLA steels and were found to have excellent arc stability and low moisture content. Sol gel fluxes offer the consistency necessary for welding systems which will use in situ sensing and microprocessor control. A capacitance technique has been developed for moisture content measurements of the coating on covered electrodes. Aluminum weld metal cracking has been characterized for both binary and commercial aluminum alloys. A new model for the prediction of the susceptible and extent of hot cracking has been developed. TRANSITION METAL. 2: COMPLEXES OF DITHIACYCLOPHANES Final Report, 20 Sep. 1982 - 19 Sep. 1985
Earl Doomes, Thornton Rhodes, and Derald Chriss 25 Mar. 1986 16 p
(Grant DAAG29-82-G-0013)
(AD-A169107; ARO-19740.1-CH-H) Avail: NTIS HC A02/MF A01 CSCL 07/3

This investigation is related to our recent report on the synthesis and characterization of cobalt (II), copper (II), and nickel (II) complexes of the new macrocyclic ligand, 7-oxa-2,12-dithia(13)(2,6)pyridinopphane (1). The coordination chemistry of a series of structurally related macrocylclic ligands (1-8) was investigated. Macrocycles studied include oxa-, dioxa-, and thia- dithiapyridinophanes (2a, 2b, and 3a, respectively), oxa-, dioxa-, trioxa- and polymethylene-dithiaparacyclophanes (4a and 5, 4b and b) and 2,10-dithia(3.3) (2,6)pyridinophane (9). The pyridinophanes (2a, 2b, 3a and 9) formed stable crystalline complexes when treated with methanol solutions of cobalt (II), copper (II), and nickel (II) salts. However, cobalt (II) and nickel (II) salts did not form crystalline complexes when combined with the paracylcophanes (4, 5, and 6). Electronic spectra, electrolytic conductivities and magnetic susceptibilities data, and elemental analyses were utilized in the characterization of these complexes. Solution and solid state effective magnetic moments were identical for each complex derived from the oxapyridinophane 1, indicating that the same species exists in both phases. Overall, physical data support monomeric structures of general formula M(II)LX2 (where M(II) = the transition metal (II) cation, L= macrocycle, and X = halogen or thiocyanate) for all complexes studied. SEMICONDUCTOR/INSULATOR FILMS FOR CORROSION PROTECTION Final Report
F. C. Jain Oct. 1985 52 p
(Contract N62269-83-M-3295)
(AD-A169119; NADC-86028-60) Avail: NTIS HC A04/MF A01 CSCL 20/12

Aluminum surfaces exhibit significantly improved corrosion protection when they are coated with suitable semiconductor/insulator thin films. These coatings, generally realized in Metal-Semiconductor (MS) or Metal-Insulator-Semiconductor (MIS) structural configurations, give rise to an interfacial electric field which acts as an effective built-in electronic barrier. This active barrier significantly impedes the transfer of electrons from the aluminum surface to foreign species which cause oxidation by accepting the electrons. Anodic polarization data on numerous samples fabricated in both MS (e.g., Al-Indium Tin Oxide (ITO)) and MIS (e.g., Al-SiO2-ITO) configurations have demonstrated the protective nature of the built-in active electronic barrier. In particular, we have observed a rest potential of -1.126 volts (1% NaCl, 2pH solution) for Al-SiO2-pITO samples in polarization tests. The electronic barrier heights have been shown to increase with: (1) the presence of a thin (20-100 A) SiO2 layer at the metal-semiconductor interface; and (2) the energy gap of ITO which depends upon the indium content. A comparison of these results with data obtained on plasma-deposited Al-Si3N4 samples is presented. GRA

EMBRITTLEMENT OF A HIGH AND A LOW STRENGTH STEEL IN LIQUID LEAD ENVIRONMENT Final Report
M. H. Kamdar Apr. 1986 28 p
(AD-A169443; ARCCB-TR-86014) Avail: NTIS HC A03/MF A01 CSCL 11/6

A study has been made of the cyclic fatigue fracture behavior of single-edge notched specimens of 4340 type high strength (yield stress 160 Ksi) and alloy steel of low strength (yield stress 100 Ksi) with and without a fatigue precrack tested in liquid lead and argon at 700 F. The high strength steel specimens were severely embrittled by liquid lead with stress intensity at fracture some two orders of magnitude lower in liquid lead than in the argon environment. The embrittlement susceptibility was the same for both the notched specimens and for the specimens that had a fatigue precrack at the root of the notch. On the other hand, identical as-notched specimens of low strength steel were immune to lead embrittlement. However, when these specimens were fatigue precracked, they were severely embrittled by liquid lead. This variation is susceptibility to embrittlement is discussed in terms of the prevalent reduction in cohesion mechanism of liquid metal embrittlement. The implications of these results in determining the embrittlement susceptibility or elimination are also discussed. GRA

FRACTURE TOUGHNESS OF CIP-HIP BERYLLIUM AT ELEVATED TEMPERATURES Final Report, 13 May 1980 - 13 Feb. 1981
L. M. Barker and A. H. Jones Apr. 1986 25 p
(Contract DAAG46-80-C-0038)
(AD-A169769; TR-81-50; MTL-TR-86-10) Avail: NTIS HC A02/MF A01 CSCL 11/6

The fracture toughness of CIP-HIP (Cold Isostatic Pressed-Hot Isostatic Pressed) Beryllium was determined using the short bar fracture toughness (K sub IcSB) method. The K sub IcSB value measured was 10.96 MPa x the square root of m at room temperature. This falls well within the expected range of 9 to 12 MPa x the square root of m as observed from previous fracture toughness measurements of beryllium. Toughness increased rapidly between 400 F and 500 F reaching a value of 16.7 MPa x the square root of m at 500 F. GRA

MICROMECHANISMS AND TOUGHNESS FOR CLEAVAGE FRACTURE OF STEEL
A. R. Rosenfield and B. S. Majumdar Jun. 1986 14 p
(Contract DAAG29-85-K-0035)
(AD-A169906; ARO-21673.2-MS) Avail: NTIS HC A02/MF A01 CSCL 11/6

A complete understanding of the fracture mechanisms of steel in the ductile/brittle transition region requires analysis not only of crack initiation, but also of crack propagation. This paper reviews micrographic and fractographic experiments that give insight into both phenomena, and suggests a frame-work through which both may be related. Unstable cleavage crack initiation can occur after some blunting of the original fatigue precrack or after some stable crack growth. In either event, instability appears to be triggered by the fracture of a brittle micro-constituent ahead of the precrack. The large scatter in reported KIc values within the transition region reflects the size distribution and relative scarcity of these trigger particles. While a large number of models have attempted to correlate toughness in the ductile/brittle transition regime to events occurring ahead of the crack tip, surprisingly little attention has been paid to events occurring behind the crack front. Fractographic evidence as well as metallographic sectioning of arrested cracks show that the mechanism of rapid crack propagation by cleavage is affected strongly by partial crack-plane deflection which leaves unbroken ligaments in its wake. The tearing of these ligaments by dimple-rupture is the dominant energy-absorbing mechanism. Etch-pit experiments using an Fe-Si alloy show that the crack-tip stress intensity based on plastic zone size is extremely low. GRA

FATIGUE BEHAVIOR OF LONG AND SHORT CRACKS IN WROUGHT AND POWDER ALUMINUM ALLOYS Annual Report, 15 Apr. 1985 - 1 May 1986
Robert O. Ritchie and Weikang Yu 1 May 1986 127 p
(Grant AF-AFOSR-0181-82)
(AD-A169980; UCB/RP/86/A1040; AFOSR-86-0447TR) Avail: NTIS HC A07/MF A01 CSCL 11/6

The fatigue behavior of short cracks, which are small compared to the scale of the microstructure, small compared to the scale of local plasticity or simply physically small (i.e., < or = 1 mm), must be considered as one of the major factors limiting the application of defect-tolerant fatigue design for airframe and engine components. Accordingly, the current program is aimed at identifying factors which govern the growth of such short cracks (in contrast to long cracks) in a series of commercial aluminum alloys, with specific reference to behavior at near-threshold levels (below approx. .000001)mm/cycle. In this annual report, the status of the program is described in terms of (1) a description of results on the role of compression overloads in influencing fatigue crack growth in a new aluminum-lithium alloy (2090) and a comparison of behavior with results in 2124 and 7150, (2) an evaluation of the role of crack tip shielding in controlling the growth of short (50 to 400 micrometers) through-thickness cracks and small (10 to 400 micrometers) surface cracks in 2124, and (3) a general assessment of the small crack problem. It is concluded that the near-threshold behavior of long cracks and the near- and sub-threshold behavior of small cracks is strongly influenced by considerations of crack tip shielding, specifically from crack deflection and crack closure mechanisms. A FUNDAMENTAL STUDY OF P/M PROCESSED ELEVATED TEMPERATURE ALUMINUM ALLOYS Annual Technical Report, 1 Oct. 1984 - 30 Sep. 1985
A. Lawley and M. J. Koczak Oct. 1985 28 p
(Grant AF-AFOSR-0010-82)
(AD-A170697; AFOSR-86-0567TR) Avail: NTIS HC A03/MF A01 CSCL 11/6

The ambient and elevated temperature strength and microstructural stability of powder processed Al-Fe-Ni alloys are being evaluated with respect to processing mode, microstructure, and microstructural stability. The overall objective is to establish a basic understanding of processing-microstructure relations in this new class of alloys in order to establish design guidelines for limiting stresses and temperatures. In the current program year, rapidly solidified prealloyed powder containing 0.19 volume fraction of FeNiAl9 dispersoid (similar to 0.18 micrometer) was mechanically alloyed (MA) and subsequently hot extruded to full density. The MA alloy is stronger than the non MA alloy at temperatures up to about 300 C. In addition, MA enhances microstructural stability at elevated temperature; for example there is no significant coarsening of the FeNiAl9 after 624 hours at 450 C. Improvements in alloy strength and stability are attributed to the presence of fine scale (similar to 30 nm) oxides and carbides introduced during MA, and which are distributed uniformly throughout the matrix, at matrix intermetallic interfaces, and on sungrain boundaries. This fine-scale dispersoid provides effective resistance to dislocation bowing (Orowan mechanism) below 300 C. At higher temperatures, dislocation climb is the controlling mechanism and the small oxides/carbides are no longer effective barriers to climb. GRA

EFFECT OF HYDROGEN ON THE MECHANICAL PROPERTIES AND FRACTURE BEHAVIOR OF HIGH PURITY ALUMINUM
Felix Zeides and Howard K. Birnbaum Jul. 1986 131 p
(Contract NOOO14-83-K-0468)
(AD-A171214) Avail: NTIS HC A07/MF A01 CSCL 11/6

In this study of hydrogen effects on 99.999% pure aluminum, hydrogen was introduced by a corrosion process. Two corrosive media were used; deionized pure water was used for dynamic

hydrogen charging during mechanical tests and an alkaline solution for hydrogen precharging. Hydrogen was found to change the response of the material to plastic deformation causing softening and plastic deformation localization on the macroscale and slip line coarsening as well as an increase in their waviness on the microscale. Hydrogen did not cause an earlier onset of the macroscopic plastic instability, i.e., necking. Hydrogen modified the fracture mode from a totally ductile, chisel point type to a more brittle transgranular or intergranular fracture. Fracture started only after onset of necking. The hydrogen induced fracture modification is believed to result from the plastic deformation modification and from the effect of hydrogen on microvoid nucleation. Some fracture surfaces were covered with a film that was occasionally fragmented by a network of cracks which is believed to be a post fracture effect caused by adhesive wear between opposite fracture surfaces. Hydrogen charging resulted in formation of bulk vacancy clusters, linear dimensions shrinkage and grain growth which were interpreted as evidence for vacancy production during the corrosion reaction and for a significant hydrogen-vacancy binding enthalpy. EFFECT OF RESIDUAL STRAIN ON TWINNING IN SHOCK-LOADED COPPER
G. T. Gray, III 1986 3 p Presented at the Annual Joint Meeting of the Electron Microscopy of America and the Microbeam Analysis Society, Albuquerque, N. Mex., 10 Aug. 1986
(Contract W-7405-eng-36)
(DE86-007362; LA-UR-86-796; CONF-860829-1) Avail: NTIS HC A02/MF A01

Under shock-loading, twinning is observed in metals that do not twin under conventional loading conditions, for example, copper and nickel where the stacking fault energy is about 78 and 129 ergs/cm^2, respectively. Contradictions in the published data on the twinning stress in copper (from 1.6 GPa in thin films to 14.5 to 20 GPa in bulk specimens) suggest differences associated with experimental techniques. This study examines the role of residual plastic strain (epsilon sub res) on the deformation substructures, particularly twinning, in shock-loaded copper. DOE

INITIATION OF PITTING CORROSION IN MARTENSITIC STAINLESS STEELS
W. R. Cieslak, R. E. Semarge, and F. S. Bovard 1986 11 p Presented at the Annual Joint Meeting of the Electron Microscopy of America and the Microbeam Analysis Society, Albuquerque, N. Mex., 10 Aug. 1986
(Contract DE-AC04-76DP-00789)
(DE86-007627; SAND-86-0251C; CONF-860829-3) Avail: NTIS HC A02/MF A01

The form of localized corrosion known as pitting often initiates preferentially at microstructural inhomogeneities. The pit initiation resistance, therefore, is controlled by the characteristics of the initiation sites, rather than by the bulk material composition. This investigation correlates the pit initiation resistance, as measured by critical pitting potentials, with preferred pit initiation sites for 3 martensitic stainless steels. Pit initiation sites are determined by secondary electron (SE) and backscattered electron (BSE) imaging and energy dispersive and wavelength dispersive spectrometries (EDS and WDS) with a scanning electron microscope (SEM) and an electron probe microanalyzer (EPMA). APFIM STUDY OF ANTIPHASE AND GRAIN BOUNDARIES IN NI AI
J. A. Horton and M. K. Miller 1986 5 p Presented at the Annual Joint Meeting of the Electron Microscopy of America and the Microbeam Analysis Society, Albuquerque, N. Mex., 10 Aug. 1986
(Contract DE-AC05-84OR-21400)
(DE86-008494; CONF-860829-4) Avail: NTIS HC A02/MF A01

Ni Al is an ordered intermetallic material and is potentially useful for high temperature applications. Unlike most alloys the yield stress of Ni Al actually increases with an increase in temperature. Unfortunately, pure Ni Al exhibits a brittle intergranular fracture and, consequently, low ductility. However, doping Ni Al with boron improves the mechanical properties and can result in room temperature ductilities up to 50% and a completely transgranular failure. Auger electron spectroscopy (AES) has shown that boron segregates to those boundaries which can be made to fail intergranularly and that no embrittling agents are found on fracture surfaces of pure NiAl. Atom probe field-ion microscopy (APFIM) is an excellent technique to study the structure and chemistry of good boundaries, especially for light elements such as boron. Results from this study have shown that boron segregates to both grain boundries and antiphase boundaries (APB) and that a thin phase is usually present at the grain boundaries in rapidly solidified Ni Al. APFIM STUDIES OF PHASE TRANSFORMATIONS
M. K. Miller 1986 15 p Presented at the Annual Joint Meeting of the Electron Microscopy of America and the Microbeam Analysis Society, Albuquerque, N. Mex., 10 Aug. 1986
(Contract DE-AC05-84OR-21400)
(DE86-008533; CONF-860829-8) Avail: NTIS HC A02/MF A01

The atom probe field-ion microscope (APFIM) has proven to be a very effective instrument for studying phase transformations in many metallic systems. The atom probe field-ion microscope provides a technique for direct observation and quantification of important microstructural and chemical features of the transformation such as the three-dimensional morphology of the evolving phases, the wavelength and spatial extent of the solute-rich regions, the sharpness of the interface between the phases, and the changes in composition of the coexisting phases. The atomic spatial resolution of the instrument permits the earliest stages of phase transformations to be investigated experimentally. The unrestricted mass range permits the location and quantification of all elements, including the light elements such as carbon and boron, to be determined. In this paper a summary of some of the types of information relating to phase transformations that may be obtained with the atom probe is outlined. DOE

RADIATION-INDUCED SEGREGATION TO GRAIN BOUNDARIES IN A NI-SI ALLOY
W. Kesternich, N. H. Packan (Oak Ridge National Lab., Tenn.), and H. Schroeder 1986 3 p Presented at the 11th International Congress on Electron Microscopy, Kyoto, Japan, 31 Aug. 1986
(Contract DE-AC05-84OR-21400)
(DE86-010027; CONF-860854-3) Avail: NTIS HC A02/MF A01

Solute transport by radiation-induced segregation (RIS) leads to local changes of alloy composition. RIS was studied in a binary Ni-8 at. % Si alloy by 7-MeV-proton and 28-MeV-alpha particle irradiations. Damage levels varied between 0.1 and 0.3 dpa. The irradiations were carried out at 475 C, the expected peak RIS temperature; preimplantation of helium at 700 C was carried out in some specimens. Solute segregation was studied by energy-dispersive X-ray analysis (EDX). Using very fine electron-beam

probes of 2 nm diameter from a high-brightness field-emission source, microchemical profiles across the grain boundaries were measured. Radiation-induced precipitation of Ni3Si was investigated by dark-field transmission electron microscopy (TEM). DOE

DESIGN OF STRONG, DUCTILE, HSLA AND DUAL PHASE STEELS
G. Thomas Jan. 1986 31 p Presented at the 1st Indo/US Workshop on Iron and Technology, Ranchi, India, 6 Jan. 1986
(Contract DE-AC03-76SF-00098)
(DE86-011313; LBL-21303; CONF-860174-1) Avail: NTIS HC A03/MF A01

The alloy design programs at Berkeley which utilize the concept of two-phase steels as a means of optimizing these mutually exclusive properties are described. The idea is to design composite microstructures whereby the advantages of the second phase are optimized while the less desirable features of this phase are mitigated simultaneously by the presence of the other constituent phase. The size, distribution, shape and volume fraction of the second phase critically control the mechanical properties, especially fracture and fatigue of the dual phase systems. As a consequence, these structures offer a degree of metallurgical flexibility that is absent in single phase structures or in many precipitation strengthened systems, for attaining optimum sets of mechanical properties. Examples are presented here of martensite/austenite (approx. 2 to 5%) mixtures designed for optimum combinations of high strength, toughness, and wear properties in medium carbon steels, e.g., for mining and agricultural applications, and martensite/ferrite (approx. 80%) structure for high strength, cold formability and improved low temperature ductility in low carbon steels. Use of the latter for sheet, line pipe rods and wires is considered. DOE

BAINITE IN CHROMIUM-MOLYBDENUM STEELS
R. L. Klueh 1986 6 p Presented at the International Conference on Martensitic Transformations (ICOMAT-86), Nara, Japan, 26 Aug. 1986
(Contract DE-AC05-84OR-21400)
(DE86-011781; CONF-860879-1) Avail: NTIS HC A02/MF A01

Classically, bainite is divided into an upper and lower variety, as distinguished by microstructural differences that are related to the isothermal-transformation temperature at which the bainite is formed. Two other microstructural variations have been proposed: granular (massive) and carbide-free acicular bainite. These varieties form more readily during a continuous cool. The effect of the bainite microstructure on mechanical properties was investigated. Carbide-free acicular and granular bainite were produced by varying the cooling rate from the austenitization temperature in a 3Cr-1.5Mo steel. A cooling rate of about 100 C/min produced acicular bainite and 7 C/min produced granular bainite. After tempering to a similar ultimate tensile strength (UTS), there were marked differences in the impact behavior of the acicular and granular bainite. The tempered acicular structure developed superior Charpy V-notch impact properties: an upper shelf energy of 225 J and a ductile-brittle transition temperature of -70 C for UTS of 770 MPa. Similar impact properties for the granular bainite were obtained only after the steel was tempered to a UTS of 590 MPa. Electron microscopy studies indicated that there were differences in the precipitate and dislocation distributions in the two bainite structures, which must cause the difference in properties. DOE

N87-12667# Oak Ridge National Lab., Tenn.
USE OF ANALYTICAL ELECTRON MICROSCOPY IN EVALUATING FERRITE STABILITY IN AUSTENITIC STAINLESS STEEL WELDS
J. M. Vitek and S. A. David 1986 13 p Presented at the Annual Joint Meeting of the Electron Microscopy of America and the Microbeam Analysis Society, Albuquerque, N. Mex., 10 Aug. 1986
(Contract DE-AC05-84OR-21400)
(DE86-008537; CONF-860829-6) Avail: NTIS HC A02/MF A01

Stainless steel weld filler metals are prone to hot-cracking during welding. If the primary mode of solidification is ferrite formation rather than austenite formation, the tendency for hot-cracking is reduced. Type 308 stainless steel is such a filler metal which solidifies as primary ferrite and is relatively immune to hot-cracking problems. During further cooling, the primary ferrite transforms to austenite. When such duplex austenite plus ferrite weld microstructures are subjected to elevated temperature applications, the residual ferrite is unstable and transforms. Analytical electron microscopy has been used to study the ferrite stability. Results have provided insight into the stability of ferrite during welding and also during service at elevated temperatures. This paper considers three cases in which the use of analytical electron microscopy has led to understanding of ferrite stability in duplex type 308 stainless steel welds. DOE

MICROSTRUCTURAL STUDY OF HIGH ENERGY DENSITY DISSIMILAR METAL WELDS
M. J. Ciesiak, C. R. Hills, and T. J. Headley 1986 15 p Presented at the Annual Joint Meeting of the Electron Microscopy of America and the Microbeam Analysis Society, Albuquerque, N. Mex., 10 Aug. 1986
(Contract DE-AC04-76DP-00789)
(DE86-009284; SAND-86-0812C; CONF-860829-17) Avail: NTIS HC A02/MF A01

Electron microscopy analysis of two different CO2 laser welded dissimilar metal combinations revealed the presence of minor constituents which could be attributed to terminal solidification events. In the case of the 15-5 PH/HP 9-4-20 welds, a NbC/austenite eutectic-type constituent was identified, which accounted for the observed fusion-zone hot cracks in these welds. The identity of the interdendritic constituent first observed optically by Patterson and Milewski in 304L/625 GTA welds has been confirmed as Laves phase. It was further determined that this phase is enriched in Mo and Nb relative to the austenite matrix. DOE

ATOMIC RESOLUTION STUDY OF PRECIPITATES IN AN Al-Ge ALLOY
U. Dahmen, C. Nelson, and K. H. Westmacott Mar. 1986 5 p Presented at the Annual Joint Meeting of the Electron Microscopy of America and the Microbeam Analysis Society, Albuquerque, N. Mex., 10 Aug. 1986
(Contract DE-AC03-76SF-00098)
(DE86-011308; LBL-21287; CONF-860829-27) Avail: NTIS HC A02/MF A01

The difficulty of precipitating germanium in dilute aluminum-germanium alloys is due to a large difference in crystal structures (face-centered cubic and diamond cubic) accompanied by a substantial volume expansion of 36%. A great variety of precipitate morphologies and orientation relationships are observed. A frequently found morphology is that of <100> needles. By selected area diffraction and Moire fringes it has been established that <100> Al and <110> Ge are parallel along the needle axis. The typical aspect ratio of about 100 has made it difficult in the past to investigate the cross-sectional shape and internal structure of these needles, although some indications of internal twinning were found in plates. In the present work, the Berkeley Atomic Resolution Microscope was used to examine needles in

cross section by imaging along the <110> Ge <100> Al needle axis. DOE

APPLICATION OF HYDROGEN EMBRITTLEMENT MODELS TO THE CRACK GROWTH BEHAVIOR OF FUSION REACTOR MATERIALS
R. H. Jones Mar. 1986 27 p Presented at the 2nd International Conference on Fusion Reactor Materials (ICFRM-2), Chicago, Ill., 13 Apr. 1986
(Contract DE-AC06-76RL-01830)
(DE86-011614; PNL-SA-13478; CONF-860421-51) Avail: NTIS HC A03/MF A01

Hydrogen induced crack growth rates of HT-9 have been estimated for three sources of hydrogen: the plasma, nuclear reaction and aqueous corrosion. Estimates of crack growth rates were derived using hydrogen embrittlement models which describe the temperature and hydrogen activity dependence of cracking. A crack growth rate of 10 to the -3 cm/s at a reactor operating temperature of 400 C was obtained for a steady-state hydrogen concentration of 0.5 appM resulting from (n,p) reactions, while a much slower crack growth rate was predicted for the same steady-state hydrogen concentration with an alternate model. These calculations have shown the need for further research to assess the effect of temperature on crack growth. Other sources of hydrogen give very slow hydrogen induced crack growth rates at reactor operating temperatures, while significant hydrogen induced crack growth rates are possible at lower temperatures. For instance, hydrogen from a cathodic corrosion reaction could produce a crack growth rate of 10 to the -7 cm/s at 25 C which could be significant during extended downtime. Also, a non-equilibrium hydrogen uptake from the plasma could occur from surface reaction controlled effects, and a crack growth rate of 10 to the -1 cm/s was estimated for this condition at a temperature of 75 C. DOE

CHARACTERIZATION OF THE ATOMIC EMISSION IN INCONEL 718 ALLOY METAL VAPOR ARCS
R. L. Williamson, H. C. Peebles, L. A. Bertram, W. A. Hareland, and F. J. Zanner 1986 21 p Presented at the Vacuum Metallurgy Conference on Specialty Melting and Processing, Pittsburgh, Pa., 9 Jun. 1986
(Contract DE-AC04-76DP-00789)
(DE86-012178; SAND-86-1356C; CONF-8606148-1) Avail: NTIS HC A02/MF A01

Visible and UV emission spectroscopy was used to identify and study various atomic species in the plasma of a vacuum arc furnace during a remelt of Inconel 718. The studies were carried out at a base pressure of 10 mtorr, and with the furnace backfilled with CO to a total pressure of 100 mtorr. Various emitting species were identified, and the internal energy distributions of a number of these species were mapped out using Boltzmann plots. Internal temperatures of 6000 to 7000 K were measured for the neutral atomic species in the low pressure arc, while a value of 11,600 K was obtained for the ion temperature. In addition, the density of the highly volatile element Mn in the interelectrode region was found to be greatly enhanced compared to its relative abundance in the bulk alloy, indicating the importance of vaporization in determining the atomic composition of the arc plasma. Increasing the furnace pressure resulted in an increase in the temperature of the neutral species of 1500 to 4000 K, and an apparent suppression of the Mn vaporization rate. DOE

MECHANICS OF METAL FORMING
P. R. Dawson, G. M. Eggert, and K. K. Mathur 1986 32 p Presented at the 10th US National Congress of Applied Mechanics Conference, Austin, Tex., 16 Jun. 1986 Prepared in cooperation with Cornell Univ., Ithaca, N.Y.
(Contract W-7405-eng-36)
(DE86-012414; LA-UR-86-2065; CONF-8606132-1) Avail: NTIS HC A03/MF A01

A metal forming model is outlined for analyzing large strain bulk operations such as forging, rolling, and drawing. Plastic deformations are assumed to be viscoplastic in that the strain rate dependent flow stress depends on the strain hardening through an internal variable that evolves with the deformations. Volumetric deformations are linked to the growth of voids (porosity) using a damage model in which the porosity serves as an internal variable. Several applications are presented that demonstrate by comparison to experimental data that the model can simulate effectively the response of a workpiece under realistic forming conditions. DOE

CRACK-TIP CHEMISTRY AND FRACTURE MECHANICS-BASED MODEL OF THE CRACK GROWTH RATE/STRESS INTENSITY RELATIONSHIP FOR Ni + P
R. H. Jones, M. J. Danielson, and C. A. Oster Feb. 1986 15 p Presented at the ASM Metals Congress/TMS-AIME Fall Meeting, Toronto, Ontario, Canada, 13 Oct. 1985
(Contract DE-AC06-76RL-01830)
(DE86-011106; PNL-SA-13447; CONF-8510160-18) Avail: NTIS HC A02/MF A01

A crack-tip chemistry model capable of describing the K/sub ISCC/ and stages I and II crack growth rate kinetics of Ni + P has been developed. This model incorporates the electrochemistry in the crack, IR drop effects, corrosion rate effects along the crack wall, material yield strength and plastic flow properties, and crack geometry parameters. The model predicts that cracking proceeds with a well defined threshold followed by a stage I with a rapid increase in crack growth rate and a stage II in which the crack growth rate is independent of the stress intensity; however, the threshold is underpredicted. A discussion of crack-tip shielding and critical strain effects on these calculations is presented. A critical fracture strain concept can account for the difference in the calculated and measured K/sub ISCC/. Crack growth rates in the stage II regime are underpredicted by a factor of 5. Mechanical fracture occurring simultaneously with anodic dissolution could account for this difference, but direct evidence for such a process is not available. DOE

MICROCHEMICAL ANALYSIS OF POLYCRYSTALLINE NI3AI AND OTHER ORDERED ALLOYS USING THE FIELD-ION MI-

CROSCOPE ATOM PROBE Progress Report
S. S. Brenner 10 Jan. 1986 11 p
(Contract DE-FG02-85ER-45213)
(DE86-013157; DOE/ER-45213/2) Avail: NTIS HC A02/MF A01

The goal of the study is to elucidate the mechanism by which boron and other solutes affect the ductility and strength of polycrystalline Ni3Al and other ordered intermetallics. The study is part of a BES-sponsored interlaboratory effort to bring various analytical and theoretical methods to bear on this question. The first discussion meeting of the members of this group was held at the Oak Ridge National Laboratory on September 20, 1985. Our initial field-ion microscopy and atom probe microanalysis results on Ni3Al were represented at that meeting. This paper summarizes the results of our study obtained during the first six months of the contract period. DOE

EFFECTS OF GRAPHITIZATION ON THE ENVIRONMENTAL STABILITY OF BROMINATED PITCH-BASED FIBERS
James R. Gaier and Melissa E. Slabe (Cleveland State Univ., Ohio) 1986 13 p Presented at the Fall Meeting of the Materials Research Society, Boston, Mass., 1-5 Dec. 1986
(NASA-TM-88899; E-3323; NAS 1.15:88899) Avail: NTIS HC A02/MF A01 CSCL 11C

The residual bromine graphite intercalation compounds of high modulus pitch-based fibers (Amoco P-55, P-75, P-100, and P-120) were formed and their resistances were monitored under a variety of environmental conditions. A threshold graphitization was observed below which the bromination reaction does not occur to an appreciable extent. The graphitization of the P-55 fibers falls below that threshold, precluding an extensive reaction. The P-75, P-100, and P-120 fibers all form bromination compounds which are stable at ambient conditions, under vacuum, and under high humidity (100 percent humidity at 60 C). The thermal stability of the resistivity increased with decreasing graphitization, with the stable temperature for P-120 being 100 C; for P-100, 200 C; and for P-75, 250 C. When cost is a consideration, bromination of pitch-based fibers is an economical way to achieve low resistivities. Author

INVESTIGATION OF THE EFFECTS OF COBALT IONS ON EPOXY PROPERTIES
Jag J. Singh and Diane M. Stoakley Dec. 1986 16 p
(NASA-TP-2639; L-16196; NAS 1.60:2639) Avail: NTIS HC A02/MF A01 CSCL 11G

The effects of Co(acac)sub x complexes on MY-720 epoxy properties have been investigated. It appears that Co2(+) ions form antibonding or nonbonding orbitals which increase the free volume and also reduce the cohesiveness of the host epoxy. The effects of Co2(+) ions, on the other hand, seem to result in increased Cohesiveness of the epoxy. The experimental values of magnetic moments of both types of ions in MY-720 suggest that the orbital momentum contributions of the (3d) electrons are partially conserved, though the effect is more pronounced for Co2(+) ions. The coordination environment of the cobalt ions in the host epoxy does not appear to be uniquely defined. These results indicate that the effects of metal ions on resin properties cannot be easily predicted on the basis of ligand field theory argument alone. Complex interactions between metal ions and host epoxy molecular structure suggest the desirability of parallel experimental investigations of electronic, magnetic, and mechanical properties of metal ion-containing epoxy samples for comparison with theory. ELECTROKINETIC PROPERTIES OF POLYMER COLLOIDS Final Report
F. J. Micale and D. Y. Fuenmayor Mar. 1986 14 p
(Contract NAS8-35989)
(NASA-CR-178938; NAS 1.26:178938) Avail: NTIS HC A02/MF A01 CSCL 11B

The surface of polymer colloids, especially polystyrene latexes, were modified for the purpose of controlling the electrokinetic properties of the resulting colloids. Achievement required a knowledge of electrical double layer charging mechanism, as a function of the electrolyte conditions, at the polymer/water interface. The experimental approach is to control the recipe formulation in the emulsion polymerization process so as to systematically vary the strong acid group concentration on the surface of the polymer particles. The electrophoretic mobility of these model particles will then be measured as a function of surface group concentration and as a function of electrolyte concentration and type. An effort was also made to evaluate the electrophoretic mobility of polystyrene latexes made in space and to compare the results with latexes made on the ground. Author

FRAGMENTATION DYNAMICS OF ENERGETIC MATERIALS Final Report, 10 Jan. 1983 - 9 Jan. 1986
Edward R. Grant 13 May 1986 35 p
(Contract DAAG29-83-C-0020)
(AD-A168925) Avail: NTIS HC A03/MF A01 CSCL 07/5

A molecular beam unimolecular fragmentation mass spectrometer has been developed and applied to the study of primary dissociation processes in energetic materials. The experimental approach uses infrared multiphoton excitation to prepare isolated molecules in the beam for dissociation. Visible laser induced multiphoton ionization detects products with time-of-flight scattering angle and internal quantum state resolution. This report describes the method, spectroscopic results on CH2, CH3CHO, sym-C3N3H3 and NO2, together with experimental observations on the primary decomposition dynamics of NO2, and RCHCH2O with R = CH3, C2H5, and C6H13. A principal component of the contract has been the development of the renormalization group, with specific emphasis on applications to percolation and random materials. The main accomplishment is summarized in a series of several papers. One of these was identified by the Science Citation Index as being among the 100 most-cited physics papers during 1980 to 1981. This paper dealt with the problem of how the Wilson renormalization group could be applied to random systems in a fashion that yielded specific numbers that could be compared with real systems. The approach developed rests on the essential idea of percolation, that elements must connect across a macroscopic distance. This approach was extended to continuum percolation shortly thereafter, confirming that results first obtained for lattice systems also hold when there is no lattice. Other random systems, like linear and branched polymers, were found to be made tractable by the suitable modifications of our original approach. GRA

(AD-A169243; Rept-6340A; ARO-19251.5-CH) Avail: NTIS HC A02/MF A01 CSCL 20/4

The aerodynamic breakup of liquids is an essential mechanism in many processes, e.g., fuel atomization in liquid rocket engine, turbojet afterburners and ramjets, paint spraying, aerial dissemination of insecticides, and explosive dissemination of fuels. Only limited studies have been conducted on the aerodynamic breakup of viscoelastic fluids where molecular parameters must necessarily play an important role in the control of both the magnitude of the mean mass diameter of the droplets and the droplet size distribution. The viscoelastic properties of bulk liquid can be altered by using polymer additives whose molecular weight, concentration an dcomposition control the conversion of bulk liquid into specific droplet sizes for a fixed stress and geometry. In this report, we want to summarize the experimental preparations we have made to characterize both static and dynamic properties of polymer additives in dipolar (aprotic) liquids. We have developed a generalized technique to determine the molecular weight, the molecular weight distribution, the polymer composition, the interaction parameters expressed in terms of the second virial coefficients, including both thermodynamic and hydrodynamic interactions for copolymers by means of laser light scattering. As a specific example, we characterized acryloid k-125, a quasiterpolymer used in aerodynamic breakup tests. GRA

THE CONTROL OF POLYMER MECHANICAL BEHAVIOR BY SURFACE MODIFICATION Final Report, 1 May 1979 - 4 Jul. 1985
Lawrence J. Broutman 15 May 1986 10 p
(Contract DAAG29-79-C-0094)
(AD-A169252; ARO-16425.3-MS; ARO-19026.1-MS) Avail: NTIS HC A02/MF A01 CSCL 11/9

The effect of a brittle surface layer on the mechanical behavior of polymers has been studied. The brittle surface layer has been simulated by laminating a thin film to a polymer or by ultra violet irradiation of the surface. Fracture mechanics theories have been utilized to account for the phenomenon of surface embrittlement. A criterion has been established suggesting that embrittlement will only occur when the dynamic stress intensity factor in the brittle layer reaches a value greater than the arrest toughness of the ductile substrate. It has also been shown that the embrittlement phenomenon can be described in terms of a critical crack velocity or critical thickness. It is shown that brittle films less than .005 inches thick can cause brittle failure of polymers such as polycarbonate and ABS. It is also shown that cracks can attain velocities of up to 200 m/sec when propagating through such films. GRA

(Grant AF-AFOSR-0238-82)
(AD-A169971; AFOSR-86-0348TR) Avail: NTIS HC A08/MF A01 CSCL 11/2

The densification of aluminum oxide in hot isostatic pressing has been studied in detail. Methods for calculating maps of densification rate as a function of temperature and applied pressure have been developed. A new mechanism, interface-reaction-controlled grain-boundary diffusion has been found which describes the densification of high-purity, fine-grained (grain radius of 0.7 micrometers) aluminum oxide powder at temperatures up to 1423 K. Theoretical models have been developed for this mechanism for both the initial and final stages of densification. Standard geometries have been used for the models; the initial stage is described in terms of impinging spherical particles, and the final stage is described in terms of isolated pores. The theoretical model is found to describe the data for fractional densities up to at least 0.9, although it breaks down for higher densities. From theoretical studies of final stage, we find indications that the discrepancy between theory and experiment is due at least in part to neglect of the effects of a distribution of pore sizes. GRA

(Contract F49620-85-C-0073)
(AD-A170001; SWRI-8578/2; AFOSR-86-0485TR) Avail: NTIS HC A02/MF A01 CSCL 11/2

This report summarizes the results of a fundamental study involving experimental characterization and analytical modeling of grain boundary cavitation and creep crack growth in structural ceramics exposed to pure tensile loading. The major experimental techniques employed in the program are the use of small-angle neutron scattering to characterize cavity nucleation and growth and stereoimaging analysis to characterize the stress and strain fields associated with growing creep cracks. In the first section of the report, the experimental progress is summarized. The design of the pure tensile creep apparatus, which is being used for the creation of bulk damage and for creep crack growth, is discussed. The progress made in the determination of surface preparation conditions that are adequate for the stereoimaging analysis is also discussed. The second section of the report describes the results of a critical review of recent experimental and theoretical studies of creep cavitation in ceramics. The results of this critical study have identified a number of stochastic aspects of cavitation. The stochastic nature of cavitation arises primarily due to the depen-

dence of both cavity nucleation and cavity growth on grain boundary sliding. A degree of randomness is also imposed by the nonuniform distribution of nucleation sites. GRA

Ti-6-4, being a high strength, lightweight, corrosion resistant alloy, possesses many uses for structural adhesive bonding. Many researchers are therefore finding better pretreatments, characterizing the oxide surface and evaluating bonding performance. The work reported here will encompass both oxide characterization and evaluation of adhesive bonds. The chemical composition of oxides created by specific pretreatments was studied by XPS, AES, SIMS, contact angles, and indicator dyes. The surface topography and structure was probed by SEM, STEM, and profilometry. Following the procedures of Carre and Schultz with aluminum substrates, values for the surface energy of the Ti-6-4 oxides are obtained using an interfacial contact angle method. Because of the present interest in the use of Ti-6-4 for high temperature applications, the thermal stability of the oxide layer was investigated. Following Pike's successful use of inorganic primers as adhesion promoters on aluminum substrates, studies were begun to characterize a titanate primer. Finally, both lap shear and wedge tests have been used to evaluate the adhesive/oxide interphase. GRA

An elimination reaction for the formation of conjugated polymers from polymer precursors containing alternating sp superscript 3 carbon atom and conjugated segments in the main chain is described. The resulting conjugated polymers with alternating aromatic and quinonoid sequences are inaccessible by conventional polymerization processes. The Pi-electron conjugation extension process is exemplified by reactions performed on poly(5,5',alpha-bithiophenediyl p acetoxybenzylidene) at 23 C and followed by electronic and infrared spectra. The semiconductor band gap narrowed from an initial value of 1.53 eV for the precursor polymer to about 0.83 eV for the conjugated derivative. Further evidence for the sp superscript 3 to sp superscript 2 carbon atom conversion by the elimination process is provided by infrared data. GRA

There are several ways to introduce processability to conjugated polymers, and one of them is discussed here. The basic approach involves the introduction of flexible centers in a conjugated backbone with a periodicity that allows the existence of conjugated sequences characterized by an electron mobility high enough to result in electronic conduction upon oxidation or reduction. The process consists of the use of AsF5 as a polymerization catalyst, and AsF3 as a non-conventional medium for the reaction. The Lewis acid coupling reactions, via which the polymerization occurs, result in soluble materials. Characteristics

the materials obtained by polymerizing acetylene and some omatic compounds are discussed. DOE

OLID-STATE ELECTROCHROMIC SWITCHABLE WINDOW ILAZINGS Progress Report
. K. Benson, C. E. Tracy, and M. P. Ruth Apr. 1986 71 p
Contract DE-AC02-83CH-10093)
DE86-004455; SERI/PR-255-2627) Avail: NTIS C A04/MF A01
Multilayer, solid-state electrochromic coatings have been repared and characterized. The electrochromic activity is based n hydrogen-ion insertion into a microcrystalline tungsten oxide H sub x WO sub y) layer from a hydrated microcrystalline agnesium fluoride layer. The coatings typically consist of four yers deposited sequentially onto glass: transparent conductor in-doped indium oxide, ITO) 330 nm; electrochromic material (H ub x WO sub y) 500 nm; hydrated fast-ion conductor/electron urrent blocking layer (MgF) 100 nm; and transparent conductor old) 13 nm. Solar-weighted and photopic-weighted optical properties are reported for individual layers and complete multilayer coatings. The electrooptic response of complete solid-state coatings is also reported. Maximum transmittance through the four layer coatings with gold conductive layers was limited to 32% solar and 56% visible. Replacing the gold conductive layer with a tin-doped indium oxide layer increased the maximum transmittance to 59% solar and 64% visible but impaired the electrochromic response. Large area coatings were fabricated (700 cm^2) and shown to operate in the same manner as the 12 cm^2 test specimens. Preliminary analyses were made of possible production costs and possible energy savings benefits which would be derived from optimal use of such switchable window coatings. DOE

PULSED-LASER, HIGH SPEED PHOTOGRAPHY OF ROCKET PROPELLANT SURFACE DEFLAGRATION Final Report, 1 May 1983 - 30 Sep. 1985
Roger J. Becker May 1986 104 p
(Contract F04611-83-K-0023)
(AD-A169308; UD-TR-85-147; AFRPL-TR-86-039) Avail: NTIS HC A06/MF A01 CSCL 21/9
High speed movies of solid propellant deflagration have long provided useful qualitative information on propellant behavior. Consequently, an extension of performance to include quantitative behavior of the surface, particularly the spatial relationship of particles across the surface, the temporal behavior of particles through extended periods of time, and accurate measurements of particle sizes, is highly desirable. Such measurements require the ability to take detailed movies across an extensive surface through

the propellant flame for longer periods than the residence time of a given particle. For such experiments, camera optics employing magnification are undesirable, since they severely limit both the field of view and the depth of field, and hence, the useful duration of a frame sequence. Unfortunately, high resolution without magnification pushes both the diffraction limits and the performance capabilities of standard lenses. At this limit, the modulation transfer function (MTF) of the camera optics and film will greatly affect performance. The MTF of the optics can be improved by a factor of two or more at practical spatial frequencies by the use of monochromatic light, such as the reflected light from a laser. This is especially true for off-axis rays, and important consideration when an extended field-of-view is required. The use of an intense, short-pulsed laser has the additional advantage of suppressing flame brightness and motion blur. GRA

There is a continual quest to upgrade the performance of state-of-the-art propellants and explosives. The three principal ingredinets of these systems are the oxidizer, plasticizer, and polymeric binder. Consequently, a major effort has been carried out in the past years to synthesize and characterize high-energy, high-density compounds that could be utilized for these applications. Recent research work by Dr. H. G. Adolph at the Naval Surface Weapons Center (NSWC) has revealed three attractive new propellant and/or explosive ingredients. These compounds are 1,3,3,5,7,7-hexanitrooctahydro-1,5-diazocine, a high-energy solid oxidizer candidate; 4,5-bis(fluorodinitromethyl)-1,3-dioxalane (DHFEFO), a high density liquid plasticizer candiate; and certain fluorinate polyformals, which are high density prepolymer candidates. The objective of this program was to synthesize and characterize sufficient quantities of these materials so that they could be a more fully evaluated by the technical staffs at NSWC and the Naval Weapons Center (NWC). DETERMINATION OF THE COEFFICIENT OF THERMAL EXPANSION OF JP-4 FUELS Interim Report, Apr. 1983 - Jul. 1985
Donovan S. Duvall, Michael D. Hale, Donald J. Lewis, and Arthur D. Snyder Dec. 1985 51 p
(Contract F33615-81-C-2035)
(AD-A171495; AFWAL-TR-85-2093) Avail: NTIS HC A04/MF A01 CSCL 21/4

Precise density determinations were made on 100 JP-4 jet fuels using a Mettler/Paar Model ADS-55 density measuring system. Statistical analysis of the density measurements was performed using a computerized nonlinear regression technique; and coefficient of thermal expansion values were calculated for each fuel at 60 F. A majority of the fuels (88 out of 100) were consistent with the API published volume series correction for crude oils. GRA

PRODUCTION OF A CLEAN CARBON FUEL DERIVED FROM COAL FOR USE IN STATIONARY AND MOBILE HEAT ENGINES
M. Steinberg Apr. 1986 25 p Presented at the 8th International Symposium on Coal Slurry Fuels Preparation and Utilization, Orlando, Fla., 27 May 1986
(Contract DE-AC02-76CH-00016)
(DE86-011203; BNL-38086; CONF-860548-2) Avail: NTIS HC A02/MF A01

Described is the development of a new process called HYDROCARB and the production of a new fuel product called CARBOLINE (an acronym for carbon-gasoline), which has potential world-wide economic usefulness. It is a clean carbon fuel which can be used in stationary, steam, and electrical power generating plants and for mobile transportation engines. The HYDROCARB process converts any abundantly available carbonaceous raw material such as coal, peat, tar, biomass (wood), agricultural materials and commercial and industrial wastes, into a clean carbon fuel. This fuel is produced in two forms: one is a solid particulate carbon black, which can readily be burned in a boiler, turbine, or internal combustion engine, and the other is a clean liquid carbon fuel made by mixing the solid particulate carbon black with either water, alcohol, gasoline, oils or other conventional liquid fuel to form a mix or slurry fuel CARBOLINE. Because of the vast resources of coal throughout the world, the new process will have greatest applicability in the conversion of coal to clean solid carbon fuel and to a liquid CARBOLINE mix fuel competitive with world petroleum derived fuel costs. ANVIL DETONATOR: A 300EC-STABLE, HOT-WIRE-IGNITED, NONPRIMARY-EXPLOSIVE DEVICE
R. H. Dinegar and J. O. Johnson Jul. 1986 8 p
(Contract W-7405-eng-36)
(DE86-013635; LA-10749-MS) Avail: NTIS HC A02/MF A01

The search for a combination of explosives and low-energy means of initiation that will function in the 300 C region appears to be successfully concluded. PYX, NONA, HNS-II, and KP have been employed satisfactorily as donor charges in hot-wire-ignited, flying-plate assemblies. The standard method of construction used in flying-plate detonators is unsatisfactory, however. A completely new and novel design that results in consistent initiation, employing a shock-up process has been developed. In this anvil detonator, PYX is the donor charge and NONA is the acceptor explosive. DOE

PLASMA ASSISTED SURFACE COATING/MODIFICATION PROCESSES: AN EMERGING TECHNOLOGY
Talivaldis Spalvins 1986 15 p Presented at the 1st International Ion Nitriding Conference, Cleveland, Ohio, 15-17 Sep. 1985; sponsored by the American Society for Metals
(NASA-TM-88885; E-3274; NAS 1.15:88885) Avail: NTIS HC A02/MF A01 CSCL 13H

A broad understanding of the numerous ion or plasma assisted surface coating/modification processes is sought. An awareness of the principles of these processes is needed before discussing in detail the ion nitriding technology. On the basis of surface modifications arising from ion or plasma energizing and interactions, it can be broadly classified as deposition of distinct overlay coatings (sputtering-dc, radio frequency, magnetron, reactive; ion plating-diode, triode) and surface property modification without forming a discrete coating (ion implantation, ion beam mixing, laser beam irradiation, ion nitriding, ion carburizing, plasma oxidation). These techniques offer a great flexibility and are capable

ailoring desirable chemical and structural surface properties pendent of the bulk properties. Author

E APPLICATION OF BOUNDARY-ELEMENT TECHNIQUES SOME SOIL-STRUCTURE INTERACTION PROBLEMS Final ort
. Vallabhan and Jayaraman Sivakumar Apr. 1986 91 p
ntract DACW39-83-M-1805)
-A168999; ATC-86-2) Avail: NTIS HC A05/MF A01 CSCL 13

Boundary-element technique research performed to solve -structure interaction problems is the basis for this report. cifically, it was designed to answer questionable situations for hydraulic U-Lock structures erected on elastic soil. A review rlier research that employed the Kelvin-type element directed decision in favor of Flamant-type boundary element. Both stant and linear elements were developed and many sample blems were dealt with to illustrate the capabilities of these ments in the problem situations of soil-structure relationships. Flamant-type boundary element proved to be convenient, gave ter results for displacement problems using the constant ment, offered satisfactory behavior description of soil-structure ponse, required considerably fewer elements than the conven- al model, provided more accuracy in stress analysis of structure, was confirmed as very beneficial for use in input data paration. Research was also conducted on soil-structure raction problems with the structure modeled by the finite- ment method and the soil modeled by the boundary-element thod. A model problem suggested by the AEWES was selected study and solving. The emphasis was to develop a convenient economical technique to couple the boundary- and finite- ment methods of analysis. A computer code for coupling the methods has been developed in FORTRAN. GRA

BRICATION AND TESTING OF LIGHTWEIGHT HYDRAULIC STEM SIMULATOR HARDWARE Final Report, 15 May 80 - 15 Nov. 1985
liam N. Bickel and Robert K. Haning Jan. 1986 279 p
ontract N62269-80-C-0261)
D-A169884; NA-85-0134; NADC-79024-60) Avail: NTIS A13/MF A01 CSCL 13/7

The Lightweight Hydraulic System (LHS) Advanced Develop- ent Program is a multi-phase investigation of the concept of ing an 8000 psi operating pressure level to achieve smaller and hter weight hydraulic components than those used in aircraft th conventional 3000 psi systems. This report presents the sults of Phase II in which a full scale A-7E 8000 psi dual stem hydraulic simulator was fabricated and tested. Tests nducted were proof pressure, system integration, baseline, namic performance, and 600 hours of endurance cycling. No ajor technological problems were encountered. Four flight ntrol actuators accumulated over 3,000,000 cycles; one pump cumulated over 1000 hours of operation (Phase I and Phase II). Hydraulic system math models were corroborated by test data. A weight and space analysis update projected 33.1% and 36.3% savings, respectively, over an equivalent 3000 psi system. A study of simulator operating experience indicated a 23% improvement in reliability over a comparable 3000 psi system. An additional 600 hours of simulator endurance cycling are scheduled for completion in FY '86. GRA

PHASE CHANGE THERMAL ENERGY STORAGE METHODS FOR COMBAT VEHICLES, PHASE 1 Final Report
F. E. Lynch Jun. 1986 63 p
(Contract DAAK70-85-C-0077)
(AD-A170492) Avail: NTIS HC A04/MF A01 CSCL 13/1

Three alternative cooling methods, based on latent heat absorption during phase changes, were studied for potential use in combat vehicle microclimate temperature control. Metal hydrides absorb heat as they release hydrogen gas. Plastic crystals change from one solid phase to another, absorbing heat in the process. Liquid air boils at cryogenic temperature and absorbs additional sensible heat as the cold gas mixes with the microclimate air flow. System designs were prepared for each of the three microclimate cooling concepts. These designs provide details about the three phase change materials, their containers and the auxiliary equipment needed to implement each option onboard a combat vehicle. The three concepts were compared on the basis of system mass, system volume and the energy required to regenerate them after use. Metal hydrides were found to be the lightest and smallest option by a large margin. The energy needed to regenerate a hydride thermal storage system can be extracted from the vehicle's exhaust gases. GRA

ANALYSIS OF MAGNETIC REFRIGERATION SYSTEMS WITH STAGED REGENERATORS BASED ON AN IDEALIZED MAGNETIC MATERIAL ENTROPY MODEL: 1
W. C. Overton, Jr. May 1986 78 p
(Contract W-7405-eng-36)
(DE86-013638; LA-10676-MS) Avail: NTIS HC A05/MF A01

We have performed a computer analysis of magnetic refrigerators consisting of a single magnetic-material (MM) stage (with T sub c = 70.5 K and resembling GdNi), a hot heat exchanger for rejecting heat to an LN sink, a cold heat exchanger for removing heat from a cold cryogenic load and an external regenerator having an integral number n of isolated stages with 5 less than or equal to n less than or equal to 10. We use the abbreviation REGMR for such a system. An idealized entropy-versus-temperature model is used to represent the magnetic material. The single MM stage REGMR model proves capable of producing refrigeration from 77 K down to less than 30 K. We estimate two such REGMRs in tandem could produce refrigeration to less than 15 K, depending on the cryogenic load. The numerical analysis is based on strict conservation of energy and we neglect the small hydrodynamic losses of the ^{4}He exchange-gas system and heat-transfer irreversibilities. Performance is evaluated in terms of the lowest temperature achievable, the number of cycles required to reach cyclic equilibrium, the effect of regenerator stage mass and number of stages, and the effect of cryogenic loads. A systematic comparison of the REGMR cycle with other thermodynamic cycles shows the

former is unique. The coefficient of performance is evaluated and the REGMR efficiency is determined by comparison with the ideal gas Carnot-cycle refrigerator. DOE

PULSE CODE MODULATION (PCM) DATA STORAGE AND ANALYSIS USING A MICROCOMPUTER
David E. Massey Aug. 1986 8 p
(NASA-TP-2629; Rept-822.3; NAS 1.60:2629) Avail: NTIS HC A02/MF A01 CSCL 17B

The current widespread use of microcomputers has led to the creation of some very low-cost instrumentation. A Pulse Code Modulation (PCM) storage device/data analyzer -- a peripheral plug-in board especially constructed to enable a personal computer to store and analyze data from a PCM source -- was designed and built for use on the NASA Sounding Rocket Program for PMC encoder configuration and testing. This board and custom-written software turns a computer into a snapshot PCM decommutator which will accept and store many hundreds or thousands of PCM telemetry data frames, then sift through them repeatedly. These data can be converted to any number base and displayed, examined for any bit dropouts or changes (in particular, words or frames), graphically plotted, or statistically analyzed. Author

TONE CALIBRATION TECHNIQUE: A DIGITAL SIGNALING SCHEME FOR MOBILE APPLICATIONS
Faramaz Davarian 15 Sep. 1986 72 p
(NASA-CR-179915; JPL-Pub-86-40; NAS 1.26:179915; MSAT-X-138) Avail: NTIS HC A04/MF A01 CSCL 17B

Residual carrier modulation is conventionally used in a communication link to assist the receiver with signal demodulation and detection. Although suppressed carrier modulation has a slight power advantage over the residual carrier approach in systems enjoying a high level of stability, it lacks sufficient robustness to be used in channels severely contaminated by noise, interference and propagation effects. In mobile links, in particular, the vehicle motion and multipath waveform propagation affect the received carrier in an adverse fashion. A residual carrier scheme that uses a pilot carrier to calibrate a mobile channel against multipath fading anomalies is described. The benefits of this scheme, known as tone calibration technique, are described. A brief study of the system performance in the presence of implementation anomalies is also given. B.G.

RECONSTRUCTION OF UNDERSAMPLED PERIODIC SIGNALS
Anthony J. Silva Jan. 1986 116 p
(Contract N00014-81-K-0742; Grant NSF ECS-84-07285)
(AD-A168897; TR-514) Avail: NTIS HC A06/MF A01 CSCL 09/3

Under certain conditions, a periodic signal of unknown fundamental frequency can still be recovered when sampled below the Nyquist rate, or twice the highest frequency present in the waveform. A new sampling criterion has been proposed which enumerates such conditions. It has been shown that in theory, if the signal and sampling frequencies are not integrally related, and the signal is band-limited (to a range the extent of which is known but otherwise unrestricted), then the signal waveshape can always

e recovered. If the fundamental frequency is known to lie within range not spanning any multiple of half the sampling rate, then e temporal scaling for the reconstructed waveform can be etermined uniquely, as well. Procedures have also been proposed r reducing time-scale ambiguity when the latter condition is not et. A previously presented time domain algorithm for reconructing aliased periodic signals has been implemented and odified. A new algorithm, operating in the frequency domain, as been proposed and implemented. In the new algorithm, the gnal fundamental frequency is first estimated from the discrete ourier transform of the aliased data through an iterative procedure. his estimate is then used to sort the aliased harmonics. IETRICS OF CLOSED WORLD OF FRIEDMANN, AGITATED Y ELECTRIC CHARGE (TOWARDS A THEORY ELECTROMAGETIC FRIEDMANN'S)
I. A. Markov and V. P. Frolov 10 Jun. 1986 34 p Transl. into NGLISH from Teoreticheskaya i Matematicheskaya Fizika (USSR), 3, no. 1, Apr. - Jun. 1970 p 3-17
AD-A168981; FTD-ID(RS)T-0475-86) Avail: NTIS C A03/MF A01 CSCL 20/10

The generalization is considered of the well known Tolman roblem to the case of electrically charged dust like matter of the entral symmetrical system. The first integrals of the correspondent ystem of the Einstein Maxwell equations are found. The problem specificated in such a way that with the full charge of the ystem going to zero, the metrics of the closed Friedman world rises. Such a system is considered at the initial moment, that of aximal enlargement. With any non-vanishing but no matter how mall value of the electric charge the metrics is unclosed. The etrics of the almost-Friedmanian part of the world allows the ontinuation through the narrow manhole (at the small charge) as e Nordstroem Reissner metrics with the parameters m sub 0 sq (chi) = e sub o. The expression for the electric potential in the anhole phi sub h = c-squared/sq rt chi does not depend upon e value of the electric charge. The radius of the manhole r sub = e sub 0 sq. rt (chi)/c-squared increases with the increase of e charge. The state of the manhole as given by the classical escription appears as essentially unstable from the quantum hysics viewpoint. The production of various pairs in the enormous lectric fields of the manhole gives rise to the polarization of the atter up to effective charge Z < 137e irrespective of the initial o matter how great) charge of the system. (AD-A169029; ARO-19838.94-EL) Avail: NTIS HC A03/MF A01 CSCL 17/2

During this period, considerable progress was made on experimental and theoretical designs for optical waveguide switches, multiplexors, and demultiplexors that can operate at a rate of 20 gigahertz, centered around the waveguide Mach-Zehnder interferometer. Extensive investigations into device applications of coupled waveguide structures have led to the ability to inject power into one of n input waveguide ports, and deliver power from any selected port using these techniques. Basic logic gates have been formed, building the interferometer in gallium arsenide, and simple exclusive OR gates have been demonstrated. Quantum noise in phase locked laser oscillators was studied, with the goal of using light that produces noise levels less than shot noise, and hence, is in a squeezed state. Oscillations in this mode have been successfully demonstrated. During this contract, a femtosecond laser facility was built which led to the achievement of optical pulses as short as 16 femtoseconds, with a center wavelength of approximately 625 nanometers, comprised of only eight optical cycles. MAXIMIZATION OF THE CAPACITY OF THE MOST SURVIVABLE CONNECTIONS IN A NETWORK M.S. Thesis
Richard V. Stockton Mar. 1986 71 p
(AD-A169065) Avail: NTIS HC A04/MF A01 CSCL 17/2

The United States is becoming increasingly dependent on telecommunications to maintain societal structure. Today, the use of communication and computer networks has attained a level which affects all lives. The loss of these networks would have a monumental effect on the everyday lives of virtually every person in the U.S. and even the world. This thesis discusses network survivability which is considered to be a function of the number of independent parallel paths between a source and destination node. A methodology is developed to determine the connectivity of a

network and then the number of independent parallel paths are determined by restricting the connectivity solution set. The capacity of the parallel paths are then maximized given that the links are not characterized by uniform capacities. GRA

Voice recognition systems are becoming increasingly widespread as forms of data entry. One such use of speech input would be as an aid to pilot communication in the cockpit. The Verbex Series 4000 Voice Recognizer (VVR) was chosen as the input channel for a forthcoming flight simulation system. The VVR is a speaker dependent unit with the ability to recognize continuous speech. An additional feature of the VVR is its use of structured grammars in defining the speech format. Tests were run to determine the VVR's reliability, and also to investigate the variations in performance for different grammar structures. Author (GRA)

KNOWLEDGE-BASED PITCH DETECTION
Webster P. Dove Jun. 1986 226 p
(Contract N00014-81-K-0742; Grant NSF ECS-84-07285)
(AD-A169069; TR-518) Avail: NTIS HC A11/MF A01 CSCL 17/2

Many problems in signal processing involve a mixture of numerical and symbolic knowledge. Examples of problems of this sort include the recognition of speech and the analysis of images. This tnesis focuses on the problem of employing a mixture of symbolic and numerical knowledge within a single system, through the development of a system directed at a modified pitch detection problem. For this thesis, the conventional pitch detection problem was modified by providing a phonetic transcript and sex/age information as input to the system, in addition to the acoustic waveform. The Pitch Detector's Assistant (PDA) system that was developed is an interactive facility for evaluating ways of approaching this problem. The PDA system allows the user to interrupt processing at any point, change either input data, derived data, or problem knowledge and continue execution. Author (GRA)

TRANSMISSION THROUGH FERRITE SAMPLES AT SUBMILLIMETER FREQUENCIES
Clyde A. Morrison, Barbara J. Bencivenga, and George J. Simonis May 1986 20 p
(AD-A169178; HDL-TR-2079) Avail: NTIS HC A02/MF A01 CSCL 20/14

A theoretical analysis is presented of the transmission spectra of thin magnetized ferrite slabs. The energy range chosen was 1 less than nu-bar less than 120 per cm (30 GHz less than f less than 3600 GHz). The magnetic field was assumed to lie in the plane of the ferrite slab, and the incident electromagnetic radiation was polarized parallel and perpendicular to the magnetic field. For measurements of the magnetic properties near resonance, we show that extremely stable sources are required. However, we show that meaningful measurements can be made far from magnetic resonances using a conventional Fourier transform spectrometer. GRA

SURFACE CORRELATION RELATIONSHIPS IN ROUGH SURFACE SCATTERING Report, for Sep. 1984 - Sep. 1985
R. J. Papa, J. F. Lennon, and R. L. Taylor Mar. 1986 36 p
(AD-A169327; RADC-TR-86-21) Avail: NTIS HC A03/MF A01 CSCL 20/14

There are a number of approaches to the calculation of the electromagnetic scattering from rough surfaces. These techniques are important in the determination of the effects of the real environment on radar and communications systems. The models contain descriptions of the surface in terms of the statistical distribution of the heights and their degree of correlation. These features are then related to a normalized radar cross section for the terrain, sigma deg, through an electromagnetic analysis. In this report we are concerned with questions involving the application of physical optics principles to the analysis. This is important since this approach is used extensively both as a complete solution and as part of composite models. Secondly, we discussed several areas where the statistics and correlation have important roles in determining the scattering from a random rough surface. This is significant in that the usual assumption of a Gaussian distribution of heights with Gaussian correlation may not apply to all types surfaces. Power spectra results suggest that other forms would be more appropriate for some cases. In the beginning of this report, we examine statistical descriptors of a surface and establish the relationship between them and the conditions for applying a physical optics model to the scattering from that surface. We then examine the sensitivity of the distribution of scattered power to changes in the form of the surface height statistics and correlation function. GRA

FOREGROUND EFFECTS ON TROPOSCATTER DIGITAL COMMUNICATION SYSTEMS Report, Nov. 1984 - Aug. 1985
Edward E. Altshuler Dec. 1985 22 p
(AD-A169380; RADC-TR-85-232) Avail: NTIS HC A02/MF A01 CSCL 17/2

Troposcatter antennas are usually pointed very close to the horizon to maximize system gain. As a result, multipath reflections from the foreground may arise. These multipath signals may have time delays that are significantly longer than direct signals, which are scattered within the common volume and thus degrade system performance. In this report, the effects of terrain-reflected multipath signals on troposcatter digital communication systems are examined. The distance that a ray travels from the transmitting antenna to a point within the common volume is calculated. The maximum differential distance that can occur for a pair of rays that intersect the common volume is than determined for a set of troposcatter geometries. The total distance that a terrain-reflected ray traverses in going from the antenna to the common volume is also calculated. It is found that, for typical troposcatter/foreground geometries, the differential distance between a direct ray and a foreground-reflected ray is small compared with the maximum differential distance that exists between direct rays within the common volume. Thus, multipath signals that would have time delays significantly longer than those scattered within the common volume must be scattered from a region outside the common volume. GRA

TRACKING SERVO COMPENSATOR WITH RATE AIDING Patent
Bill E. Burkett, inventor (to Air Force) Issued 20 May 1986 12 p Supersedes AD-D011372
(AD-D012388; US-Patent-4,590,476; US-Patent-Appl-SN-640902;

US-Patent-Class-343-7.4) Avail: US Patent and Trademark Office CSCL 17/9

A tracking servo compensator is disclosed for radar systems which steer their antenna beams using a servo-mechanism that physically moves the antenna. The disclosed tracking servo compensator permits switching between trackers (e.g., from area to point track) and from one tracked target to another without undersirable transients that could cause loss of track. Rate aiding and target range estimates are provided when tracker base motion is known. The compensator works by providing a servo signal that continually monitors the error in a servo signal that continually monitors the error in estimated track point line-of-sight angular velocity independent of which tracker is employed or the target being tracked. When base motion is known, this signal is used to update the target range estimate so that an accurate rate aiding signal is available. The servo provides smooth controlled-speed transitions between track points during mode switching, and provides an input for manual slewing of the tracker platform during offset track conditions. It also provides an estimate of platform to track point range. GRA

A BRIEF REVIEW OF ADAPTIVE NULL STEERING TECHNIQUES

J. G. McWhirter Feb. 1986 36 p

(AD-A169548; RSRE-MEMO-3939; DRIC-BR-99244) Avail: NTIS HC A03/MF A01 CSCL 20/4

A brief theoretical review of adaptive null steering is presented. The basic theory is first outlined in the context of sidelobe cancellation systems as well as general antenna arrays. Various approaches to the practical implementation of adaptive null steering are then discussed. These fall into the two main categories of closed loop methods and direct solution methods. The closed loop methods are very cost-effective and suitable in principle, for either analog or digital processing. However, their rate of convergence is fundamentally limited and too slow for some applications. The direct solution methods do not suffer from this problem but tend to be suitable only for digital processing and are more expensive from the computational point of view. However they are well suited to parallel processing and now provide a very practical alternative due to recent advances in VLSI circuit technology. A brief discussion on the effects of multi-path propagation on adaptive null steering systems concludes this review. GRA

METHOD OF RAY INTENSITY CALCULATION AS APPLIED TO ANOMALOUS PROGAGATION

D. Dion Jun. 1986 49 p

(AD-A169553; DREV-4407/86) Avail: NTIS HC A03/MF A01 CSCL 20/14

A ray tracing theory incorporating the ray intensity calculation has recently been developed at DREV. This report studies the applicability of this new ray theory to radar propagation. Using this theory, we tried to characterize the anomalous behavior of the propagation due to the refractivity of the troposphere. This report summarizes the ray theory and the validity of this approach for the study of radar propagation. A computer model has been developed to calculate ray trajectories and intensities. Considering the case of a simple surface duct, the results have shown that the intensity computation is an effective and powerful way of detecting and locating in space such singular propagation phenomena as caustics and radio holes. CARRIER-SENSE STACK ALGORITHMS FOR MULTIPLE ACCESS COMMUNICATION CHANNELS

Lazaros Merakos Mar. 1986 68 p

(Contract N00014-85-K-0547)

(AD-A169774; UCT/DEECS/TR-86-3) Avail: NTIS HC A04/MF A01 CSCL 09/2

We consider the random multiple access of a collision-type, packet-switched channel, for the Poisson user model in a local area network environment, where carrier sensing techniques are possible due to small propagation delays. We propose and analyze random access algorithms that are representative of a new class of stable algorithms with limited sensing and free access characteristics. Limited sensing algorithms require that users sense the channel only while they have a packet to transmit, and, therefore, they have practical advantages over algorithms that require continuous channel sensing. The free access characteristics of the proposed algorithms simplify their implementation, since newly arrived packets are transmitted upon arrival, provided that the channel is sensed idle. Utilizing the regenerative character of the stochastic processes that are associated with the random access system, we derive lower bounds on the maximum stable throughput, and tight upper and lower bounds on the induced mean packet delay. The proposed algorithms are easy-to-implement, and they combine inherently stable operation and high performance with modest channel sensing requirements. GRA

MULTI-ELEMENT ADAPTIVE ANTENNA ARRAY Patent Application

Kenneth R. Finken, inventor (to Air Force) Filed 3 Feb. 1986 19 p

(AD-D012410; US-Patent-Appl-SN-824994) Avail: NTIS HC A02/MF A01 CSCL 17/7

A phased array antenna is disclosed including a central reference element. This is surrounded by a plurality of sub-elements which form the adaptive elements of the array and have no feed networks. Each adaptive element is essentially an L stub, with the adaptive elements oriented such that the L top loading is circumferential around the reference element. The plurality of adaptive elements, all with different orientations of the linear top loading allows the complex weights and adaptive nulling algorithm to generate any required polarization, and form an adaptive null to any arbitrary polarized interferring signal as required. (Contracts MDA903-82-C-0064; DARPA Order 2496)

(AD-A170007) Avail: NTIS HC A07/MF A01 CSCL 09/2

Research published during this reporting period covers a broad spectrum of results in the areas of random access communications, computer networks, and distributed processing (a new and rapidly growing area of research and practical importance). In this latter area, the major works involved the behavior of distributed algorithms for election and traversal in networks, and the evaluation of the achievable and achieved parallelism in parallel processing systems. A general model of distributed processing exposed a potential areas of networks and multiaccess, our results focus on improved and innovative models. A major contribution of our

research during this reporting period is a dissertation entitled Distributed Algorithms for Election in Unidirectional and Complete Networks, by Yehuda Afek. This entire dissertation forms the body of this report. GRA

THE EFFECTS OF HIGH SUSTAINED ACCELERATION ON THE ACOUSTIC PHONETIC STRUCTURE OF SPEECH: A PRELIMINARY INVESTIGATION
Zinny S. Bond, Thomas J. Moore, and Timothy R. Anderson 21 May 1986 37 p
(AD-A170563; AAMRL-TR-86-011) Avail: NTIS HC A03/MF A01 CSCL 05/7

The acoustic-phonetic structure of speech produced under adverse circumstances such as high levels of noise, vibration, and stress, has received little investigation. The purpose of this study was to provide some preliminary data concerning speech produced under high sustained acceleration. Acoustical measurements were made of a set of words spoken by two subjects at 1 G and +6 Gz. Words produced under acceleration differed from words produced at 1 G in both spectral and durational characteristics. The formant shifts observed were similar for both speakers. The first format increased for the majority of vowels. The second format tended to be lower for the front vowels /i, epsilon/ and higher for the back vowel (u). Acceleration resulted in a raising of the first formant and a lowering of the second formant relative to the same diphthongs produced at 1 G. Author (GRA)

A NEW METHOD OF SYNTHETIC APERTURE RADAR IMAGE RECONSTRUCTION USING MODIFIED CONVOLUTION BACK-PROJECTION ALGORITHM
Mita D. Desai Aug. 1986 99 p
(Contract N00014-84-C-0149)
(AD-A170652; UILU-ENG-86-2225) Avail: NTIS HC A05/MF A01 CSCL 17/9

Synthetic Aperture Radar (SAR) imager reconstruction falls into the class of inverse (deconvolution) problems. A spotlight mode SAR system obtains projections of the ground areas at various look angles. The image of the ground area is then reconstructioned from this set of projections. The Convolution Back-Projection (CBP) algorithm is widely used in Computer Aided Tomography (CAT). In this work, the CBP algorithm has been modified so that it can be applied to image reconstruction from SAR data. A quantitative evaluation using extensive computer simulation of the CBP algorithm for spotlight mode SAR is presented. Its performance is then compared with the FFT method with respect to parameters such as multiplicative noise ratio (MNR), central processing unit CPU time, and computational complexity. It has been shown that the CBP-SAR algorithm is a high quality reconstruction method that can be implemented in real-time. The parallelism inherent in the algorithm can be exploited for parallel architectures that are suitable for very large scale integration implementation. Samples from each projection can be summed into the proper pixels in the final image, as required by the back-projection operation, so that the final image is produced shortly after the final projection has arrived. ELECTRIC AND MAGNETIC FIELD COUPLING THROUGH A BRAIDED-SHIELD CABLE: TRANSFER ADMITTANCE AND TRANSFER IMPEDANCE
Huey A. Roberts, Susan B. MacDonald, and Joseph Capobianco Jul. 1986 24 p
(AD-A171490; HDL-TR-2090) Avail: NTIS HC A02/MF A01 CSCL 20/14

Electric and magnetic coupling parameters are measured for a braided-shield cable. Starting with a general solution for the internal response of an externally excited cable, simple expressions which relate the coupling parameters to the internal and external currents and voltages result when the electrically short line approximation is used. These expressions are applied to experimental configurations in which the external excitation is either predominately magnetic or electric, and the internal loading is configured to exclude either the electrically or magnetically induced internal currents. The experimental results are compared with theoretical calculations appearing in the literature, and the relative importance of the electric and magnetic coupling effects is discussed. Author (GRA)

CSCL 20/3

This work significantly advances the understanding of electromagnetic interactions with small particles whose dimensions are of the order of a wavelength. A joint theoretical experimental approach is used so that theoretical predictions could be provided with experimental back up and vice versa. Extensive results on electromagnetic interactions with cubes and sphere multiplets have been obtained. Beautiful symmetry theorems for forward and backward scattering have been discovered. A major theoretical bonus has been the formulation of a new and very efficient method for obtaining electromagnetic scattering properties of an arbitrarily shaped particle which is built from smaller particles whose scattering has been determined. (Contract W-7405-eng-48)
(DE86-008768; UCRL-93482; CONF-860849-1) Avail: NTIS HC A02/MF A01

A number of canonical problems that describe coupling through apertures into enclosed regions have been solved. The scattering data generated by these cavity-backed aperture (CBA) solutions share a common property: they are dominated by resonance features closely connected to the presence of the cavity. The behavior of these CBA resonance features will be described for variations in frequencies, angles of incidence, look angles, aperture sizes, and interior object characteristics. In particular, it will be demonstrated that standard bistatic cross-sections contain information about the interior of the cavity. DOE

STABILIZING EFFECTS OF FINITE-AMPLITUDE RF WAVES ON THE INTERCHANGE INSTABILITY
T. F. Otani 28 Feb. 1986 26 p
(Contract DE-AS03-76ET-53064)
(DE86-013042; UCB/ERL-M-86/18) Avail: NTIS HC A03/MF A01

The effects of the presence of a finite-amplitude RF wave on the interchange instability are studied theoretically in a three-dimensional quasineutral Darwin two-fluid system. An exact energy conservation law is developed for the system equations. The perturbed dynamical quantities are expanded to second order in the fluid displacements and it is demonstrated that a Lagrangian exists for the system. The interchange perturbation energy is calculated and terms associated with the perturbed magnetic potential energy are analyzed. For the terms studied, it is found that no stabilization of the incompressible interchange mode occurs unless the RF wave has a parallel-propagating component, and that coupling to perpendicular-propagating sidebands does not influence the stability of perpendicularly-propagating interchange modes. The stabilizing influence of these terms also does not depend directly on the presence of RF field gradients. The analysis suggests a physical mechanism by which RF stabilization can occur - the RF wave stabilizes the interchange mode by forcing the mode to bend magnetic field lines. DOE

CIRCUIT CONSIDERATIONS FOR REPETITIVE RAILGUNS
M. Honih 1986 8 p Presented at the 17th Power Modulator Symposium, Seattle, Wash., 23 Jun. 1986
(Contract W-7405-eng-36)
(DE86-012369; LA-UR-86-2043; CONF-860674-9) Avail: NTIS HC A02/MF A01

Railgun electromagnetic launchers have significant military and scientific potential. They provide direct conversion of electrical energy to projectile kinetic energy, and they offer the hope of achieving projectile velocities greatly exceeding the limits of conventional guns. With over 10 km/sec already demonstrated, railguns are attracting attention for tactical and strategic weapons systems and for scientific equation-of-state research. The full utilization of railguns will require significant improvements in every aspect of system design projectile, barrel, and power source - to achieve operation on a large scale. This paper will review fundamental aspects of railguns, with emphasis on circuit considerations and repetitive operation. DOE

DEVELOPMENT OF LOW-TEMPERATURE TRANSISTOR MODULES TO IMPROVE THE MSFC MID-INFRARED ARRAY Final Report
C. M. Telesco, R. Decher, and P. Peters Oct. 1986 11 p
(NASA-TM-86566; NAS 1.15:86566) Avail: NTIS HC A02/MF A01 CSCL 09A

This report describes the low-temperature transistor modules designed for use with the MSFC mid-infrared array. The modules were developed in the Space Science Laboratory at Marshall Space Flight Center with Center Director's Discretionary Funds. The transistors (JFETs), which operate at a temperature of 77 K, are epoxied to a copper surface attached to a Teflon substrate. The module substrate insulates the JFETs from the 1.5K detector work surfaces and provides a convenient mounting structure for additional components such as solder pins. These modules have maintained their structural integrity during repeated temperature cycling, and they have to be convenient during maintenance and servicing of the infrared array. Author

This report documents work performed to develop materials systems for use in the ceramic packaging of Ga:As integrated circuits. Topics under study at Penn State are: dielectrics produced from Macro-Defect-Free (MDF) cements. Both aluminate and silicate based cements have been studied. The objectives of the first year's work have been to show that suitable test tablets can be produced which exhibit dielectric losses less than 1% into the frequency range of 2.5 GHz. Current work is focused upon lowering the permittivity level using silica microballoons dispersed in the matrix. Sol-gel preparation of both thick (25 microns) and thin (0.5 microns) SiO_2 and silica:alumina films has shown that in the diphasis system, it is possible to produce crack-free monoliths with permittivities in the range 1.6 to 2.0 and loss tangents below .003. In the thin films, capping of columnar sputtered etched films has been demonstrated. For etched Schott and Vycor glass structures, permittivities in the range 2.5 to 3.0 have been measured with excellent low loss properties. Sputtered silicon films have been sucessfully etched to yield highly planar columnar structures up to 25 microns meters thick. Experiments are in progress to convert the silicon to SiO_2 by an oxidation step and capping of the columnar structure using sol-gel coatings has been achieved. In a parallel program at Interamics, new families of borosilicate glass bonded alumina ceramics are being developed. GRA

Our research objective is to create affordable, high-rformance, 3-D raster display systems that harness the highly rallel computational power of custom VLSI circuits. We want to ake this power available in an open system that encourages vention of new parallel algorithms for image generation and image ocessing. The system has many potential applications including ght and tactical displays, computer-aided mechanical design, and edical diagnosis and therapy. As in other systems, ours includes array of memory chips forming an image buffer from which the deo screen is refreshed. The novel feature of our design is that r memory chips have been custom-designed to include proces-g circuitry so that each pixel (dot on display) can carry out its m image-generation calculations. Calculations are distributed roughout each chip in such a way that only a very small nount of circuitry is required for each pixel. In our current chips, s processing circuitry takes up about one-third of the total area, th the remainder devoted to pixel memory. During the three ars of this work, we have achieved significant experimental sults. We have developed algorithms for fast image generation, cluding very rapid rendering of spheres and shadow-casting (our stem is the only graphics machine, to our knowledge, that can nder true shadows in real time). This Interim Report describes work done in developing an aircraft battery state of charge and charge control system. The basis for this system developed by ERC is a nickel-oxygen (NiO2) Pilot cell (0.374 Ah). This pilot cell is cycled in tandem with a nickel-cadmium battery. The oxygen pressure of the pilot cell is utilized to determine and control the state of charge of the nickel-cadmium battery. The NiO2 pilot cell baseline performance was determined during this period. The effect of using different nickel electrodes (ERC, SAFT, MARATHON) was also performed. GRA

TEMPERATURE AND FREQUENCY COMPENSATED ARRAY BEAM STEERING UNIT Patent Application
Kenneth D. Claborn and William C. Bailey, inventors (to Army) Filed 30 Apr. 1986 18 p
(AD-D012365; US-Patent-Appl-SN-859283) Avail: NTIS HC A02/MF A01 CSCL 09/5

Beam pointing errors and sidelobes resulting from temperature variations on the aperture and power divider of a series phased array antenna operating at a plurality of selected operating channel frequencies and having uniformly spaced elements are compensated for by placing a temperature sensor on both the aperture and power divider and converting the respective temperature outputs to digital signals which are fed to a digital beam steering unit. A pair of programmed memories are included in the beam steering unit which respond to an address or pointer corresponding to the digitized temperature values and the selected operating frequency to read out stored digitized beam steering phase gradients and feed phase correction which are combined and sequentially applied at regular intervals to symmetrically located phase shifter pairs. A uniformly compensated beam is thereafter radiated at a predetermined phase angle. GRA

CRYOGENIC WOUND ROTOR FOR LIGHTWEIGHT, HIGH VOLTAGE GENERATORS Patent Application
Charles E. Oberly, inventor (to Air Force) Filed 23 Apr. 1986 28 p
(AD-D012370; US-Patent-Appl-SN-855047) Avail: NTIS HC A03/MF A01 CSCL 10/2

Liquid hydrogen is used to completely cool all elements of the generator including bearings, stator conductor, rotor conductor, magnetic flux shield, and excitation mechanisms. By essentially immersing the generator in liquid hydrogen, cryogenic interface problems are minimized. The conductor windings will utilize pure metals such as aluminum to minimize the weight and the ohmic heat loss in the machine. Complication of liquid helium cooling for superconducting windings and quench phenomena due to thermal instabilities in the superconductors are eliminated. The use of extremely low resistance of liquid hydrogen cooled aluminum permits heat removal in the confined space of the rotor field winding at magnetic field and current density that can exceed that of superconductors. Because iron is not required in the generator, very high voltages can be generated. GRA

N87-12769# Department of the Air Force, Washington, D.C.
Ni-Co ALLOY PLAQUE FOR CATHODE OF Ni-Cd BATTERY Patent Application
John J. Lander, inventor (to Air Force) Filed 27 Mar. 1986 14 p
(AD-D012375; US-Patent-Appl-SN-844637) Avail: NTIS HC A02/MF A01 CSCL 11/6

The present invention relates generally to Ni-Cd batteries, and, in particular, relates to the plaque material attached to the cathode. Because of the wide use of nickel-cadmium batteries, the corrosion rates of nickel and nickel-cobalt alloys are of interest to nickel-cadmium battery electrochemical theory and its technology. The plaque material of the cathode consists of a Ni-Co alloy in solid solution wherein the cobalt is by weight percent one to ten percent of the alloy. Conventional methods of applying the plaque material to the nickel core may be used. It is therefore an object of the present invention to provide an improved cathode for a nickel-cadmium battery wherein the nickel corrosion is substantially lessened in the plaque material. One process of making the plaque uses a nickel powder slurry that is applied to a nickel-plated steel core. This is then sintered at a high temperature which results in a very porous structure and an welding of the nickel grains to the core. This plaque is then soaked in appropriate salts to make either a positive or a negative plate; nickel salts make a positive plate and a cadmium salts a negative plate, for example. After impregnation, the plaque is placed in an electrolyte and an electric current is passed therethrough to convert the salts to their final form. In the nickel-cadmium cell, nickel hydroxide is the active material in the positive plate. GRA

N87-12770# Department of the Air Force, Washington, D.C.
UNIQUE MECHANIZATION TO FAULT ISOLATE FAILURES OF AN ELECTRON TUBE RADIO FREQUENCY (RF) AMPLIFIER AND ITS HIGH VOLTAGE POWER SUPPLY Patent Application
Daniel G. Miller, inventor (to Air Force) Filed 4 Mar. 1986 11 p
(AD-D012376; US-Patent-Appl-SN-835923) Avail: NTIS HC A02/MF A01 CSCL 09/5

An electronics circuit for improving the fault isolation of failures between an electron tube radio frequency (RF) amplifier and its high voltage power supply is disclosed. High voltage power supplies control their output voltage by comparing a feedback voltage against a reference. This comparison is used to develop an error voltage which, in turn, drives a pulsewidth modulator that corrects the feedback voltage to the reference. The output of a digital-to-analog converter (DAC) is used as the reference voltage. The DAC is driven by a counter which would count to the correct reference voltage represented by a specific count. The final count is determined by a comparator which compares the counter output to the desired final counter and stops the counter when it is reached. GRA

PRELIMINARY MATERIAL TESTING OF CERAMIC AND WOOD Final Report, 1 Feb. - 1 May 1985
Raymond W. Nethers and David W. Metzger May 1986 10 p
(AD-A169557; AFWL-TN-85-47) Avail: NTIS HC A02/MF A01 CSCL 13/3

Results of preliminary tests of various construction materials subjected to high voltage electrical discharge are reported along with test conduct. Two high voltage construction materials, a wood post and a ceramic insulator, were tested. As a corollary a typical wood fastening system, similar to a TRESTLE joint, was tested. Flashing over of the ceramic insulator caused no damage, while flashing over of the wood at high overvoltages causes considerable damage. Fastening systems in sparse pattern does not appear to change the standoff voltage of the wooden beam used as an insulator. GRA

COMPACTION WITH AUTOMATIC JOG INTRODUCTION M.S. Thesis
F. M. Maley May 1986 37 p
(Contract N00014-80-C-0622)
(AD-A169679; VLSI-MEMO-86-316) Avail: NTIS HC A03/MF A01 CSCL 09/5

This thesis presents an algorithm for one-dimensional compaction of VLSI layouts. It differs from older methods in treating wires not as objects to be moved, but as constraints on the positions of other circuit components. These constraints are determined for each wiring layer using the theory of planar routing. Assuming that the wiring layers can be treated independently, the algorithm minimizes the width of a layout, automatically inserting as many jogs in wires as necessary. It runs in time 0(n4) on input of size n. Several heuristics are suggested for improving the algorithm's practical performance. The compaction algorithm takes as input a data structure called a sketch, which explicitly distinguishes between flexible components (wires) and rigid components (modules). The algorithm first finds constraints on the positions of modules that ensure enough space is left for wires. Next, it solves the system of constraints by a standard graph-theoretic technique, obtaining a placement for the modules. It then relies on a single-layer router to restore the wires to each circuit layer. An efficient single-layer router is already known; it is able to minimize the length of every wire, though not the number of jogs. As given, the compaction algorithm applies only to a VLSI model that requires wires to run a rectilinear grid. This restriction is needed only because the theory of planar routing (and single-layer routers) has not yet been extended to other models. GRA

TOTALLY SELF-CHECKING CIRCUITS AND TESTABLE CMOS

CIRCUITS Ph.D. Thesis
Niraj K. Jha Jun. 1986 123 p
(Contract N00039-80-C-0556)
(AD-A189756; CSG-51; UILU-ENG-86-2217) Avail: NTIS HC A06/MF A01 CSCL 09/5

A Totally Self-Checking (TSC) circuit belongs to a class of circuits used for Concurrent Error Detection (CED) purposes. It consists of a functional circuit that has encoded inputs and outputs and a checker that monitors these outputs and gives and error indication. It is known that the traditional stuck-at fault model is not sufficient to model realistic physical failures. Techniques for implementing existing gate-level TSC circuits in CMOS, Domino-CMOS and standard CMOS technologies, so that they are TSC with respect to physical failures, are described. Design methods which reduce the transistor count, delay, and the number of tests of TSC checkers are also given. Another problem in the area of TSC circuits concerns embedded checkers whose inputs are not directly controllable. If they do not get all the required codewords to test them they cannot be guaranteed to be TSC. A new encoding technique and a design procedure to solve this problem are presented. It has been shown previously that the two-pattern tests used to test CMOS circuits can be invalidated by timing skews. A necessary and sufficient condition is derived to find out whether or not an AND-OR or and OR-AND CMOS realization exists for a given function so that a valid test set can always be found, even in the presence of arbitrary timing skews. A new Hybrid CMOS realization is introduced to take care of the cases in which this is not possible. GRA

N87-12774# Department of the Air Force, Washington, D.C.
HIGH FREQUENCY, HIGH VOLTAGE MOSFET ISOLATION AMPLIFIER Patent Application
Jones, inventor (to Air Force) et al Filed 3 Jun. 1986 24 p
(AD-D012403; US-Patent-Appl-SN-870045) Avail: NTIS HC A02/MF A01 CSCL 09/5

The present invention utilizes a high voltage isolation amplifier as the drive means for the inductor of a programmable microwave attenuator. A pair of power MOSFET devices are used to control the current flow through a magnetic yoke. The power MOSPET devices cooperate with floating operational amplifier drive circuits to act as a transconductance amplifiers and pass a load current according to command. The MOSFET isolation amplifier apparatus allows stable high frequency linear operation of MOSFET power stages and provides precise regulation of a load current through a magnetic yoke load. Variations of transfer characteristics and input parameters in the MOSFET power stages are corrected by use of a feedback signal which is generated in a current sense resistor by the load current. Such a power stage allows the implementation of isolation amplifiers which can provide high power high frequency linear regulation at elevated voltages and currents. GRA

IN-LINE DETERMINATION OF PRESENCE OF LIQUID PHASE MOISTURE IN SEALED IC PACKAGES Patent Application
N. K. Annamalai, inventor (to Air Force) Filed 19 May 1986 14 p
(AD-D012408; US-Patent-Appl-SN-864222) Avail: NTIS HC A02/MF A01 CSCL 09/3

The present invention includes an aparatus and a process for detecting moisture in sealed Integrated Circuit (IC) packages from the effect of such moisture upon the electrical characteristics of the devices. When the conductance of an IC is measured as a function of temperature across two selected pins in the absence of moisture, a decrease in conductance is seen as the temperature decreases. When moisture is present in the form of water, conductance will exhibit a sharp increase. Moisture present in the package condenses on the chip when it is called. Hence, a change in the conductance slope from positive to negative with respect to temperature, as the chip is cooled, indicates the presence of moisture in the liquid phase. Similarly, the conductance will decrease sharply when the water freezes. The presence of moisture is revealed by taking comparative measurements of conductance while cooling and heating the integrated circuit. The four sharp transitions are the following: (1) water condensing on the chip; (2) the super called water freezing into ice; (3) ice melting into water; and (4) water evaporating into the cavity. The change in conductance is quite large compared to the change in capacitance when moisture is present in the package. GRA

N87-12776# Department of the Air Force, Washington, D.C.
INTERRUPT CONTROL SWITCH INTERFACE SYSTEM Patent Application
Buddy L. Holmes, inventor (to Air Force) Filed 10 Apr. 1986 60 p
(AD-D012414; US-Patent-Appl-SN-849991) Avail: NTIS HC A04/MF A01 CSCL 09/2

Switch contacts may be monitored without pulling them. The apparatus comprises an input port module and up to eight switch reader modules, with 128 switch contacts to each. The input port module has four Z80 PIOs providing a total of eight ports for the switch reader modules, and a S-100 bus to a processor. In each switch reader module, a clock provides a four-phase cycle. An address counter cycles to address the 128 switch contacts. In a RUN mode, the operation is to address a switch contact via a multiplex unit on phase one, load the data into a latch on phase two, the output of the latch being the input of a 128-bit shift register, compare the current and previous states represented by the inputs and outputs of the shift register on phase three, advance the shift register on phase four, and advance the address counter on phase one for reading the next switch contact. During phase three, if the switch contact being addressed has changed state, the comparator generates a strobe pulse which is supplied to the port for the switch reader to initiate an interrupt to the processor. At the same time that a strobe pulse is generated, a scan inhibit command is supplied from the comparator to stop the clock. Data from the address counter and the latch output are supplied via the input port module to the processor. The processor then returns a ready signal to resume the scan. There is also a LOAD mode using 512 (4 X 128) read operations to cycle the clock and load the 128 bits of the shift register. GRA

DECLARATIVE DESCRIPTIONS FOR VLSI GENERATORS Interim Report
Meei-Chiueh Y. Liem Jun. 1986 115 p
(Contracts MDA903-85-K-0072; ARPA Order 4563)
(AD-A169952; TR-86-08-06-03) Avail: NTIS HC A06/MF A01 CSCL 09/5

This thesis presents a declarative generator model which can be used to guide the generation of a circuit in VLSI design. The descriptions in the model provide four equivalent representations of a circuit. They are the layout description, the mixed mode description, the schematic description, and the functional description. Each serves a unique purpose in the VLSI design process. They are correlated through corresponding components. These descriptions are declarative, abstract, robust, and structured in a hierarchical manner. The syntax and semantics of the declarative descriptions are introduced. Their applications are illustrated by examples. The declarative descriptions are shown to greatly facilitate the VLSI design process and serve as a comprehensive tool that documents the designer's ideas as well as the complexities of a circuit. INVESTIGATION OF A NEW CONCEPT IN SEMICONDUCTOR MICROWAVE OSCILLATORS Annual Report, 1 May 1985 - 30 Apr. 1986
James A. Cooper, Jr. 20 May 1986 32 p
(Grant AF-AFOSR-0193-85)
(AD-A170772; AFOSR-86-0527TR) Avail: NTIS HC A03/MF A01 CSCL 09/5

The goal of this research is to fabricate and characterize a new type of semiconductor device known as a contiguous-domain transferred oscillator. This device differs from existing semiconductor oscillators in several fundamental ways, and should be capable of direct electronic tuning in the range from a few gigahertz to a few hundred gigahertz. During the first year of this project, test chips were designed, masks were made, and a processing schedule was worked out. Three aspects of the processing required special attention: implant activation, resistive gate formation, and silicon nitride deposition. Uncapped flash annealing was used for implant activation, and satisfactory results were achieved. GRA

INVESTIGATION OF A NEW CONCEPT IN SEMICONDUCTOR MICROWAVE OSCILLATORS Interim Report
James A. Cooper, Jr. 13 Nov. 1985 4 p
(Grant AF-AFOSR-0193-85)
(AD-A170831; AFOSR-86-0597TR) Avail: NTIS HC A02/MF A01 CSCL 09/5

Our project centers on the fabrication and characterization of a new type of millimeter-wave semiconductor oscillator, the so-called Contiguous-Domain Transferred-Electron Oscillator. To date, the only operational information we have about this device has been derived from computer simulation, and therefore our objective is to obtain experimental verification. The device is interesting (and potentially important) because it operates in a fundamentally different way from any existing semiconductor oscillator device, with the result that it should be capable of very high frequency oscillation (over 100 GHz) without the requirement for sub-micron drift dimensions. In addition, the oscillations are not based on a transit-time effect, and thus the frequency can be changed during operation by simply changing the rate at which carriers are admitted into the drift channel. The structure is similar to a conventional GaAs MESFET or MODFET, except that the gate is made resistive and has two contacts, one near the source and the other near the drain. We will not describe the operation of the device in detail here, but refer the reader to the original proposal and to the enclosed article. GRA

DIRECT WRITING OF MICROSTRUCTURES FOR SOLID-STATE ELECTRONICS Final Report, 1 Feb. 1984 - 31 Jan. 1986
Richard M. Osgood, Jr. 19 Apr. 1986 54 p
(Contracts F49620-84-C-0022; ARPA Order 4487; AF Proj. 2301)
(AD-A170837; AFOSR-86-0555TR) Avail: NTIS HC A04/MF A01 CSCL 09/5

This report summarizes two years of research on new laser processing techniques on opto- and microelectronics. The main results are in: (1) the demonstration of UV laser direct writing of low resistivity metal lines, and the subsequent demonstration of the usefulness of laser writing (via deposition) in the reconfiguring of an LSI circuitry; and (2) the discovery, characterization, and understanding of the techniques of light-guided etching for the fabrication of ultra-high-aspect-ratio microelectronics structures. In the case of light-guided etching, an application of the technique to optical interconnects has already been demonstrated. Author (GRA)

INPUT IMPEDANCE OF AN INFINITE LINEAR SCANNED ARRAY OF FLAT RECTANGULAR STRIPS INSIDE A DIELECTRIC LOADED PARALLEL PLATE WAVEGUIDE
S. N. Samaddar 29 Jul. 1986 58 p
(AD-A171275; NRL-MR-5830) Avail: NTIS HC A04/MF A01 CSCL 09/5

Impedance variation as a function of H-plane scan angles of an infinite linear array of flat rectangular monopoles (strips) inside a dielectric loaded parallel plate waveguide is studied both theoretically and experimentally in the S-band frequencies. In theoretical analysis simplified along the probes (monopole strips) and neglect of the effect of the gap at the junction of a probe and its coaxial feed line, were made. It is found that this simplified theory can predict qualitatively the experimental data of interest, such as input impedance. Both theory and experiments show that a dielectric slab with a relatively low dielectric constant (1.3) inserted in an appropriate manner can improve the bandwidth and impedance performance of the array. Certain experimental results show a bandwidth of about 28% with respect to the center frequency 3.5 GHz, having a VSWR <2. Another interesting result is the relation between the width W of a flat rectangular probe and the radius rho of a circular probe situated similarly inside two identical rectangular waveguides. The probe impedances or VSWR's for these situations are found to be the same, respectively, for all practical purposes when W approx. 4.882 rho, which was obtained numerically representing a correction to the electrostatic result W = 4 rho found by Wheeler. TWO-DIMENSIONAL BEAMFORMING USING A FREQUENCY DOMAIN COMPLEX LEAST MEAN-SQUARES (LMS) ADAPTIVE FILTER M.S. Thesis
Francis Chan Jun. 1986 138 p
(AD-A171396) Avail: NTIS HC A07/MF A01 CSCL 09/5

The complex LMS adaptive algorithm developed by Widrow is used in the frequency domain to estimate the azimuth and elevation angles of a plane wave incident upon a planar array. The complex LMS algorithm is applied to two cases. The first case is a passive detection problem. The second case is a pulse communication problem. In both cases, complex weights are determined using

ne complex LMS algorithm which cophase all of the output lectrical signals from the planar array. Three versions of the omplex LMS algorithm are studied and their performances are ompared. Author (GRA)

ABRICATION OF GATE ARRAY INTERCONNECT STRUC-URES USING DIRECT-WRITE DEPOSITION PROCESSES
. Mitlitsky, J. C. Whitehead, A. F. Bernhardt, and B. M. McWilliams 986 13 p Presented at the Les Houche Winter School, France, 5 Mar. 1986
Contract W-7405-eng-48)
DE86-010785; UCRL-94494; CONF-8603122-1) Avail: NTIS C A02/MF A01

General principles of laser direct-write deposition processes re reviewed. Device interconnection of CMOS gate arrays by eans of computer-controlled, laser-induced thermochemical urface reactions is described. Maskless, automated five-minute terconnection of 1000 gate CMOS array dies is described using iscretionary laser-induced chemical vapor deposition. Eight 25-stage ring oscillators written on a single CMOS gate array die ere shown to have the device-limited performance of similar atterns manufactured by a photolithographically patterned luminum-silicon alloy. These results suggest the feasibility of using is method, Laser Pantography (LP), for rapid implementation of rototype and limited volume semi-custom VLSI circuits immediately fter their design is completed. ODIUM-SULFUR BATTERY SYSTEMS DEVELOPMENT
. J. Beninga and B. L. Butler May 1986 23 p Presented at e Intersociety Energy Conversion Engineering Conference, San iego, Calif., 25 Aug. 1986
Contract DE-AC04-76DP-00789)
DE86-011424; SAND-86-7102C; CONF-860810-12) Avail: NTIS C A02/MF A01

Results of Na-S battery systems analyses are presented. The erformance of various network configurations for a load leveling attery in the presence of multiple cell failures was assessed with e use of a computer model. Results indicate that the life of a attery can be extended by a factor of 3 to 4 with the use of a witch to assure either open circuit or short circuit failure of each ell. Other means of extending the life of the battery are presented. uture work is outlined for the effort to design a 100 MW-h Na-S ad leveling battery. DOE

ontract DE-AC04-76DP-00789)
E86-012247; SAND-85-1518) Avail: NTIS HC A04/MF A01

From May 1983 through April 1985 Sandia National Laborato-s continued to develop and evaluate nondestructive methodology predicting the reliability of primary lithium batteries. During this riod, considerable time was spent improving the microcalorimetry ta acquisition and processing software and completing the rve-fitting algorithm for the impedance data. All initial measure-ents were conducted, and all cells either completed the storage rtion of the text matrix or remained in storage. Some statistical analyses were completed. Several nondestructive measurement variables that correlate well with remaining capacity were identified. Finally, the status of the program was evaluated and the program was tentatively extended to October 1986. DOE

NANOSECOND SPARK GAP SWITCHING MEASUREMENTS
J. W. Ginn, D. N. Hendricks, and M. T. Buttram Jun. 1986 5 p Presented at the 17th Power Modulator Symposium, Seattle, Wash., 23 Jun. 1986
(Contract DE-AC04-76DP-00789)
(DE86-012279; SAND-86-0512C; CONF-860674-7) Avail: NTIS HC A02/MF A01

The switching time of gas and oil dielectric spark gaps was measured in the nanosecond and subnanosecond time regime. The observed switching characteristics of the two spark gaps were compared with those predicted by empirical formulas. The formulas used primarily were those developed in somewhat slower time regimes by J.C. Martin. For the given geometry, the switching times of both gaps were dominated by the resistive phase rather than by any inductive effects. The rise times observed from the output of the gas switch were consistently greater than those predicted for resistive phase duration in a gas spark. With charge times of from 50 to 60 ns to electric field values of from 170 to 350 kV/cm, 10% to 90% output rise times of from 2.8 to 8.2 ns were observed. The dielectric strength of the oil switch was consistent with the empirical prediction for oil breakdown. The oil gap was charged to electric field values of from 1.4 to 3.1 MV/cm with effective charge times of from 1.3 to 20 ns. Its output rise time was less than or equal to 400 ps. This result is not inconsistent with the empirical prediction for resistive phase duration in an oil spark. Measurement of times shorter than this were limited by the bandwidth of the available equipment. DOE

A 60 GHz GYROTRON DEVELOPMENT PROGRAM Final Report, Apr. 1979 - Jun. 1984
J. F. Shively, R. E. Bier, M. Caplan, M. K. Cheng, E. Choi, C. C. Conner, L. J. Craig, S. J. Evans, S. J. Evers, and K. L. Felch 1986 707 p
(Contract DE-AC05-84OR-21400)
(DE86-012488; ORNL/Sub-79-21453/21) Avail: NTIS HC A99/MF A01

The original objective of this program was to develop a microwave amplifier or oscillator capable of producing 200 kW CW power output at 110 GHz. The use of cyclotron resonance interaction was pursued, and the design phases of this effort are discussed. Later, however, the program's objective was changed to develop a family of oscillators capable of producing 200 kW of peak output power at 60 GHz. Gyrotron behavior studies were performed at 28 GHz to obtain generic design information as quickly as possible. The first experimental device at 60 GHz produced over 200 kW of peak power at a pulse duration of 20 microsec. Heating problems and mode interference were encountered. The second experimental tube incorporated an optimized gun location but also suffered from mode interference. The third experimental tube included modifications that reduced mode interference. It demonstrated 200 kW of peak output at 100 ms pulse duration. The fourth experimental tube, which used an older RF circuit design but in a CW configuration, produced 71.5 kW CW. The fifth experimental tube incorporated a thinner double-disc output window which improved window bandwidth and reduced window loss. This tube also incorporated modifications to the drift tunnel and cavity coupling, which had proven successful in the third experimental pulse tube tests. It produced 123 kW of CW output power at 60 GHz RF load coolant boiling and tube window failure terminated the tests. A new waterload was designed and constructed, and alternative window designs were explored. A secondary task of developing a 56 GHz CW tube produced in excess of 100 kW CW at this alternate frequency. Testing of the sixth experimental tube resulted in operation at CW output power in the range of 200 to 206 kW for an hour. The seventh tube was operated for about forty-five minutes with CW power output over 200 kW. DOE

EFFICIENT, MONOCHROMATIC, HIGH-POWER MICROWAVE GENERATOR
T. J. T. Kwan and C. M. Snell 1986 6 p Presented at the 6th International Conference on High Power Particle Beams, Kobe, Japan, 9 Jun. 1986
(Contract W-7405-eng-36)
(DE86-012385; LA-UR-86-1937; CONF-860665-8) Avail: NTIS HC A02/MF A01

Microwave generation by electron beams in virtual cathode configurations can achieve significant power levels. However, most designs inherently have two competing mechanisms generating microwaves; namely the oscillating virtual cathode and the reflexing electrons. These two mechanisms tend to interfere destructively with each other. Specifically, the reflexing electrons subject the electron beam to two-stream instability, causing considerable heating of the electron beam. In addition, the space-charge of the reflexing electrons can cause the diode independence to fluctuate, resulting in oscillations of the electron beam energy. We have investigated a novel idea to remove these undesirable effects and we found that high-power, narrow-band, and monochromatic microwaves could be generated with efficiency of 10 to 20%.DOE

ZINC/NICKEL OXIDE BATTERY MEMBRANE SEPARATOR STUDIES Final Report, 15 Jul. 1984 - 1 Jul. 1985
D. N. Bennion and J. S. Bradshaw Mar. 1986 19 p
(Contract DE-AC03-76SF-00098)
(DE86-012824; LBL-21261) Avail: NTIS HC A02/MF A01

Fourteen different macrocyclic compounds were synthesized for possible use in anionic exchange membranes and several polymerized with polyvinylbenzyl chloride. Two others were used in polyvinyl alcohol (PVA) membranes. Work continued to develop a suitable polymer material for the membranes. PVA could be cross-linked using a crown-ether dialdehyde as a cross-linking agent to produce a membrane with high ionic conductivity (0.02 mho/cm) and reasonable short-term stability in strong caustic solution at room temperatures. Selectivity of the membrane for hydroxide ions was essentially the same as that in the solution itself. Two new fabrication methods for polypropylene membranes were investigated and developed. Development of a two-dimensional code of a zinc-nickel oxide cell was begun. DOE

SAW TRANSDUCTION IN ELECTROSTRICTIVE SUBSTRATES
G. R. Laguna and B. A. Auld 1986 5 p Presented at the International Symposium on Ultrasonics, Ferroelectrics and Frequency Control, Bethlehem, Pa., 9 Jun. 1986 Prepared in cooperation with Stanford Univ.
(Contract DE-AC04-76DP-00789)
(DE86-011651; SAND-86-1347C; CONF-8606121-3) Avail: NTIS HC A02/MF A01

Using electrostrictive materials for surface acoustic wave (SAW) device substrates allows for electronic control of the frequency response of the device. Centrosymmetric materials will not be piezoelectric, but by applying a static dc biasing electric field, a piezoelectric response can be induced in the substrate. If this bias field is spatially varying, then the induced piezoelectric response will also be spatially varying. In fact, since the piezoelectric response is controlled by the dc biasing electric field, changing the bias distribution will change the response of the filter. This allows for a real-time electronically programmable SAW device. The constitutive relations for pure electrostrictive materials are manipulated to show this induced piezoelectric response under an applied electric bias field. Normal mode theory is used to obtain the response of SAW devices in which a spatially varying piezoelectric response is established. The result is similar to that for standard piezoelectric theory except that the pertinent variable now becomes the spatially varying piezoelectric response. Experimental results for several spatially varying piezoelectric patterns are presented. DOE

MODELING OF HIGH-EXPLOSIVE DRIVEN PLASMA COMPRESSION OPENING SWITCHES
A. E. Greene, I. R. Lindemuth, and J. H. Goforth 1986 8 p Presented at the 4th International Conference on Megagauss Magnetic-Field Generation and Related Topics, Santa Fe, N. Mex., 14 Jul. 1986
(Contract W-7405-eng-36)
(DE86-012421; LA-UR-86-2200; CONF-860703-8) Avail: NTIS HC A02/MF A01

The initial path of the current through a plasma compression switch is through a thin (500-nm thick) metal foil. The current explodes the foil to form the seed for the conducting plasma. The behavior of the foil at this point is the same as an exploding metal fuse for which we have a simple model. We have, therefore, chosen this model as our starting point. The fuse model assumes that the foil material is homogeneous and is characterized by a single temperature and density. The thickness of the foil is assumed to be much less than the magnetic diffusion skin depth so that the magnetic field varies linearly across the foil. For the present application we assume that the side of the foil away from the channel is fixed in space while the side by the channel is untamped. The foil/plasma will, therefore, cross the channel at the expansion velocity as the foil explodes. Equations for the electrical resistance of the foil, the magnetic fields, the motion of the foil, and the kinetic and internal energies are all solved selfconsistantly. The electrical resistivity, the pressure, and the specific energy of aluminum are taken from the Los Alamos SESAME EOS library. In the case of aluminum we have created a SESAME-style table based on the theory of More and Lee which we have modified to agree with experiment where possible. DOE

TRANSFORMERS FOR EXPLOSIVE PULSED POWER COUPLING TO VARIOUS LOADS
B. L. Freeman and W. H. Bostick 1986 10 p Presented at the 4th International Conference on Megagauss Magnetic-Field Generation and Related Topics, Santa Fe, N. Mex., 14 Jul. 1986
(Contract W-7405-eng-36)
(DE86-012425; LA-UR-86-2259; CONF-860703-7) Avail: NTIS HC A02/MF A01

Tape-wound step-up transformers have been fabricated and used with magnetic flux compression generators in the past with effective coupling coefficients of approx. 0.76. We have attempted to design some units with coefficients in the range of 0.85 to 0.92 by taking advantage of newer dielectrics. The intent is to raise the voltage stress from less than or equal to 0.39 MV/cm to the range of 0.98 to 1.97 MV/cm. This has the effect of making the secondary thinner and permitting a higher coupling efficiency. Several designs for coupling the 13.2-cm-wide by 52.8-cm-long plate generator to loads in the range of 10 to 30 with an output of approx. 1 MV have been studied. These designs must take into account that the primary of the transformer is switched into the circuit as a load in parallel with the generator's ballast inductor. A final design examines the constraints imposed by attempting to transform the output of a plate generator up to 10 MV into a high impedance load. A voltage stress of 3.9 MV/cm is required in this particular design for 140 kV per turn in the secondary winding. DOE

FEASIBILITY STUDY OF A NEW ZINC-AIR BATTERY CONCEPT USING FLOWING ALKALINE ELECTROLYTE
P. N. Ross, Jr. Apr. 1986 32 p Presented at the Intersociety Energy Conversion Engineering Conference, San Diego, Calif., 25 Aug. 1986
(Contract DE-AC03-76SF-00098)
(DE86-013461; LBL-21437; CONF-860810-18) Avail: NTIS HC A03/MF A01

Proof-of-principle experiments are reported for a new concept in electrically rechargeable zinc-air batteries. The zinc electrode is a porous flow-thru type using a copper foam metal substrate with zinc deposition onto the foam metal from concentrated zincate electrolyte (as used in zinc-slurry type batteries). The bifunctional air electrode employs low-cost materials, being fabricated entirely from carbon-based precursors and small amounts of nickel and/or cobalt oxide. Corrosion measurements on the graphite materials in the air electrode indicate sufficient corrosion resistance for 8000 h life on charge. A prototype single cell was constructed having 1.5 Ah capacity producing 1.2 V discharge -2.0 charge at the three hour rate and has produced stable voltages for more than 150 cycles. Based on the 1.5 Ah prototype characteristics, design calculations for a 32 kWh battery project an energy density of about 110 Wh/kg, peak power density of 140 W/kg, electrical efficiency of 60% and an attractive materials cost of less than or equal to $20 per kWh. DOE

VERY LOW BANDWIDTH, UNATTENDED IMAGER FOR SURVEILLANCE APPLICATIONS
P. H. Eichel and C. V. Jakowatz, Jr. 1986 7 p Presented at the 30th SPIE Technical Symposium on Optics and Optoelectronic Engineering, San Diego, Calif., 17 Aug. 1986
(Contract DE-AC04-76DP-00789)
(DE86-013570; SAND-86-0599C; CONF-860880-14) Avail: NTIS HC A02/MF A01

The need arises in certain vehicular surveillance applications for an electronic imager that can perform without human interaction and can transmit definitive images over very low bandwidth channels. The investigators have found that line scan imagers offer particular advantages toward these ends. Specifically, the use of a line scan imager facilitates the following processing steps: (1) segmentation of the vehicle from the background, (2) automatic exposure control, (3) light level equalization prior to quantization, and (4) implementation of an adaptive sampling scheme. These processing steps together with the source encoder may be implemented on a relatively low throughput processor and achieve near real time operation. The specific encoding method used here is an extended differential pulse code modulation (DPCM). A prototype system has been developed, producing medium resolution images at less than 10K bits per frame. DOE

(Contract W-31-109-eng-38)
(DE85-011476; CONF-860913-1) Avail: NTIS (US Sales Only) HC A02/MF A01

New applications for lead-acid batteries, such as electric vehicle propulsion, demand high specific energy and power and good cycle life. A research and development program at Johnson Controls, Inc., sponsored in part by the United States Department of Energy through Argonne National Laboratory, has been underway since 1978 to develop advanced electric vehicle batteries. Cell test results on and Advanced Battery design developed under this program are described. Capacity, energy and power delivered at various discharge rates are shown. Material distribution and utilization are described, and the effects of discharge rate and temperature on the material utilization of both electrodes is determined. Cycle life data at 100% depth of discharge are also presented. DOE

HEAT TRANSFER CHARACTERISTICS OF SIMULATED MICROELECTRONIC CHIPS UNDER NORMAL AND ENHANCED CONDITIONS
K. A. Park and A. E. Bergles Nov. 1985 200 p Sponsored by IBM Corp., Poughkeepsie, N.Y.
(PB86-224425; ISU-ERI-AMES-86211; HTL-35) Avail: NTIS HC A09/MF A01 CSCL 09A

The heat transfer characteristics of simulated microelectronic chips were investigated with direct immersion cooling in Freon-TF (R-113). The basic heater was 4.5 mm x 4.5mm electrically heated foil. The studies of plain heaters included natural convection, nucleate boiling, and critical heat flux. Water was included as a working fluid for natural convection. Ultrasonic agitation and heat sinks were studied as enhanced cooling methods. The height effect for single flush heaters agrees qualitatively with the conventional

theory of natural convection; however, even the widest heaters have coefficients higher than predicted because of leading edge effects. The increase of the heat transfer coefficient with decreasing width is correlated. The protruding heaters have about 15% higher coefficients than the flush heaters. Data for natural convection were also obtained for in-line and staggered arrays of flush heaters with varying distances between heaters. GRA

FLUID TRANSIENTS IN PIPES. ESTIMATION OF MAXIMUM PRESSURES AND FORCES IN STEAM LINES
Sep. 1986 73 p
(ESDU-86015; ISBN-0-85679-567-4; ISSN-0141-4011) Avail: ESDU

Available as part of the ESDU Sub-series on Fluid Mechanics (Internal Flow), this document gives a graphical method for estimating the time-dependent pressure changes and piping forces that follow from a rapid value closure in a one-pipe system of constant cross-section carrying superheated steam. The method also assumes a frictionless flow and ignores wave steepening effects. A computer program listing in FORTRAN is also included that applies to any gas that obeys the perfect gas law, and takes into account the effects of both wall friction and wave steepening. In that case sections of the pipeline can have different cross-sectional areas and that can be used to treat a pipeline with branched ends. Worked examples are included for both methods and in the case of the computer program show specimen print-out of the input data, and of the output which includes the time variation of pressure, velocity and density at three points in the pipeline chosen by the user together with values of maximum and minimum pressure at 25 points (a value that is also open to choice by the user). The example is run for a valve with a linear variation of area with time, and for one with a nonlinear characteristic. ESDU

TIME-DEPENDENT SOLUTION FOR AXISYMMETRIC FLOW OVER A BLUNT BODY WITH IDEAL GAS, CF4, OR EQUILIBRIUM AIR CHEMISTRY
H. Harris Hamilton, II and John R. Spall Jul. 1986 40 p
(NASA-TM-87675; NAS 1.15:87675) Avail: NTIS HC A03/MF A01 CSCL 20D

A time-asymptotic method has been used to obtain steady-flow solutions for axisymmetric inviscid flow over several blunt bodies including spheres, paraboloids, ellipsoids, and spherically blunted cones. Comparisons with experimental data and results of other computational methods have demonstrated that accurate solutions can be obtained using this approach. The method should prove useful as an analysis tool for comparing with experimental data and for making engineering calculations for blunt reentry vehicles. Author

FINITE-DIFFERENCE SOLUTIONS FOR COMPRESSIBLE LAMINAR BOUNDARY-LAYER FLOWS OF A DUSTY GAS OVER A SEMI-INFINITE FLAT PLATE
B. Y. Wang and I. I. Glass Aug. 1986 121 p Sponsored in part by Natural Science and Engineering Research Council of Canada, and Defence Research Establishment, Suffield
(Contracts F-AFOSR-82-0096; DNA001-85-0368)
(UTIAS-311; ISSN-0082-5255) Avail: NTIS HC A06/MF A01

A finite difference method is used to investigate compressible, laminar boundary-layer flows of a dilute dusty gas over a semi-infinite flat plate. Details are given of the implicit finite difference schemes as well as the boundary conditions, initial conditions, and compatibility conditions for solving the gas-particle boundary layer equations. The flow profiles for both the gas and particle phases were obtained numerically along the whole length of the plate from the leading edge to far downstream of it. The finite difference solutions in the large-slip region and the small-slip region are compared with the asymptotic solutions and good agreement is achieved. The boundary-layer characteristics of interest, including the wall shear stress, the wall heat transfer rate and the displacement thickness are calculated. The alteration of the flow properties owing to the presence of particles is discussed in detail. It was found that the boundary-layer flow of a dusty gas can be divided into three distinct flow regimes which are characterized by quasi-frozen, nonequilibrium and quasi-equilibrium flows and that at a critical distance from the leading edge the particle velocity at the wall decelerates to zero and near-equilibrium is achieved between the gas and particle flows. A class of impulsively started, axisymmetric, laminar jets produced by a time dependent joint source of momentum are considered. These jets are different flows, each initially at rest in an unbounded fluid. The study is conducted at three levels of detail. First, a generalized set of analytic creeping flow solutions are derived with a method of flow classification. Second, from this set, three specific creeping flow solutions are studied in detail: the vortex ring, the round jet, and the ramp jet. This study involves derivation of vorticity, stream function, entrainment diagrams, and evolution of time lines through computer animation. From entrainment diagrams, critical points are derived and analyzed. The flow geometry is dictated by the properties and location of critical points which undergo bifurcation and topological transformation (a form of transition) with changing Reynolds number. Transition Reynolds numbers were calculated. A state space trajectory was derived describing the topological behavior of these critical points. This state space derivation yielded three states of motion which are universal for all axisymmetric jets. Third, the axisymmetric round jet is solved numerically using the unsteady laminar Navier Stokes equations. These equations were shown to be self similar for the round jet. Numerical calculations were performed up to a Reynolds number of 30 for a 60x60 point mesh. Animations generated from numerical solution showed each of the three states of motion for the round jet, including the Re = 30 case. Author

MODULATION TRANSFER FUNCTION (MTF) OF THE GEOMETRICAL IMAGE RESOLUTION OF THE THERMAL INFRARED BAND M.S. Thesis [FUNCAO DE TRANSFERENCIA DE MODULACAO (MTF) NA RESOLUCAO GEOMETRICA DE IMAGENS NA FAIXA DO INFRAVERMELHO TERMAL]
Hiromiti Yoshioka Jul. 1986 94 p In PORTUGUESE; ENGLISH summary
(INPE-3964-TDL/231) Avail: NTIS HC A05/MF A01

The modulation transfer function (MTF) of an imaging system is composed by the MTF's of its subsystems. The MTF of the system contributes to the formation of the EIFOV (Effective Instantaneous Field of View). In this work the MTF of an imaging system operating in a thermal infrared band was calculated. In this way, it was possible to theoretically establish the EIFOV of the equipment. Then, several experiments consisting of flights over targets with well-known temperature and dimensions were made. The images were analyzed using a microdensitometer and the

resultant curves compared to those estimated in theory. Degradations in the EIFOV due to roll movements of the airborne platform were observed. A stabilized platform can solve this problem.

THE CALCULATION OF SEPARATED FLOWS OF LOW-VISCOSITY LIQUIDS USING THE BATCHELOR MODEL
S. I. Chernyshenko Apr. 1985 13 p Transl. into ENGLISH from Mekhanika Zhidkosti i Gaza, v. 2, 1984 p 40-45
(BR-100272; RAE-Trans-2133) Avail: NTIS HC A02/MF A01

Conditions of applicability and examples of application of the Batchelor Model (BM) are considered. The application of the BM to flow near a plate mounted perpendicularly to a wall at the stagnation point is examined, and a method for solving the corresponding eddy-potential problem is described. The application of a precise form of the condition for determining vorticity is also examined. It is shown that eddy-potential flow cannot be the limit (at Re approaching infinity) of laminar flow behind a step; arguments in favor of an analogous conclusion with regard to flow past blunt bodies are presented.

PRESSURE CALCULATION FOR TWO-DIMENSIONAL FLOW INSIDE HYDRAULIC STRUCTURES Final Report
Robert S. Bernard Apr. 1986 36 p
(AD-A169039; WES/MP/HL-86-2) Avail: NTIS HC A03/MF A01
CSCL 20/4

When static pressure inside a hydraulic structure falls below some critical value, voids containing water vapor form therein. The voids then collapse with great force, pitting and eroding the internal surfaces of the structure. The formation/collapse of these voids is called cavitation, and the prevention thereof is a prime concern in structural design. The VORTEX code has been used to calculate pressure distributions for three distinct flow conditions in the outlet works for Taylorsville Lake, Salt River, Kentucky. A method has been developed for computing the two-dimensional pressure distributions inside hydraulic structures. Velocities are first obtained by finite difference solution of the Navier-Stokes equations in stream-function/vorticity form. Pressure is then calculated by numerical integration of the momentum equation. The method was incorporated for arbitrary geometry in the VORTEX computer code, which uses boundary-fitted grids generated by the WESCOR code. Computed results compare well with piezometric data from physical-model tests for the Taylorsville outlet works, indicating that the VORTEX code may be useful in identifying and eliminating low conditions that promote cavitation.

CSCL 19/4

Eigenfrequencies and decay rates of inertial waves have been measured for both Newtonian and non-Newtonian fluids contained in a cylindrical cavity while the fluid spins up from rest. The waves were excited by precessing the lid of the container until resonance was reached and detected by measuring disturbance pressure differences while the waves decayed freely. Measurements extend from 0.5 spin up times to steady state and over a range of Reynolds numbers 100-45,000 for the Newtonian fluids with precession amplitudes in the range 0.006-0.0328 radians. Measured eigenfrequencies agree to within a few percent with those previously calculated. Decay rates compare less favorably because they are more difficult to measure experimentally and to calculate theoretically. New methods of analysis were developed to recover the eigenfrequencies and decay rates. Previously used iterative techniques were modified to allow for the removal of the effects of recording filters and also automate the procedures used made possible with improved estimates of errors. New results for non Newtonian fluids which show shear thickening are presented. These fluids have anomalous behavior in the dependence of eigenfrequency and decay rate on time since the container's rotation began compared to that of a Newtonian fluid.

ADAPTIVE GRID TECHNIQUES FOR ELLIPTIC FLUID-FLOW PROBLEMS
S. C. Caruso, J. H. Ferziger, and J. Oliger Dec. 1985 205 p
(Contract N00014-82-K-0335)
(AD-A169471; CLASSIC-85-10) Avail: NTIS HC A10/MF A01
CSCL 20/4

The adaptive grid techniques are described for elliptic fluid flow problems. The method is an extension of a local refinement technique developed by Berger for systems of hyperbolic equations. Local refined grids are overlaid on a coarser base grid. Recursive use of this technique allows an arbitrary degree of grid refinement. Two classes of elliptic flows are identified; they are characterized as having strong or weak viscous inviscid interactions. Adaptive solution strategies, active and passive, respectively, are developed for each class. The simpler method is used to solve the steady, laminar, incompressible Navier Stokes equations. Central differencing of the convective terms is implemented with the defect-correction method to stabilize the solution method for all cell Reynolds numbers. Uniform grid calculations are performed for the laminar backstep flow. Richardson estimated solution and truncation errors are compared to accurate estimates of the same quantities for the backstep flow. The solution error is well predicted. The truncation error estimates are less accurate, but they reliably indicate where grid refinement is required. Active adaptive calculations of the backstep are made, using boundary aligned refinement.

IN-LINE AND TRANSVERSE FORCES ON SMOOTH AND ROUGH CYLINDERS IN OSCILLATORY FLOW AT HIGH REYNOLDS NUMBERS Interim Report, Jul. 1985 - Jul. 1986
Turgut Sarpkaya 4 Jul. 1986 176 p
(Grant NSF CEE-82-10264)
(AD-A169562; NPS69-86-003) Avail: NTIS HC A09/MF A01
CSCL 20/4

This report presents the results of an extensive experimental investigation of the in line and transverse forces acting on smooth, sand roughened, and marine roughened circular cylinders (k/D = 1/50) of identical length to diameter ratio (L/D = 2) placed in a sinusoidally oscillating flow. The drag, inertia, and the maximum force coefficients have been determined through the use of the Fourier analysis. The transverse force (lift) has been analyzed in terms of its root mean square value. In addition, the amplitude of the first ten harmonics have been determined. The results are presented in both graphical and tabulated form in terms of the Reynolds number, Keulegan Carpenter number, relative roughness and the frequency parameter beta (= Re/K).

COMPUTATIONAL FLUID DYNAMIC STUDIES OF CERTAIN DUCTED BLUFF-BODY FLOWFIELDS RELEVANT TO TURBOJET COMBUSTORS. VOLUME 1: TIME-DEPENDENT CALCULATIONS WITH THE k-EPSILON TURBULENCE MODEL FOR AN EXISTING CENTERBODY COMBUSTOR Final Report, 16 Aug. 1984 - 30 Sep. 1985
M. S. Raju and L. Krishnamurthy Jul. 1986 53 p
(Contract F22615-84-C-2411)
(AD-A171434; UDR-TR-85-82-Vol-1; AFWAL-TR-86-2004-Vol-1) Avail: NTIS HC A04/MF A01 CSCL 21/2

A numerical investigation of the near-wake region in a ducted bluff-body combustor by finite-difference computations is reported. The numerical predictions are based upon the time-dependent, compressible Navier-Stokes equations and the k-epsilon turbulence model. The standard k-epsilon turbulence model was modified to account for the nonstationary terms. The time-dependent calculations predictions addressed the nonreacting near-wake flow field of the centerbody combustor with only the annular air stream present. Flowfield predictions for a combustor inlet mass flow of 2 kg/s with the time-dependent formulation incorporating the k-epsilon turbulence model show the attainment of a steady-state recirculating flow in the near wake. The slow axial migration of the recirculation vortex towards the exit boundary which was noticed in the earlier time-dependent calculations without a turbulence model is not longer present. Present results have thus eliminated the appearance of reverse flow at the exit boundary with the consequent incompatibility of the boundary conditions, and thereby the spu rious shedding-like behavior observed previously. The steady-state results in the present study demonstrate internal consistency with the time-averaged measurements and predictions for the locations of the vortex center and the centerline rear stagnation point. NATURAL CONVECTION IN AN ENCLOSURE WITH DISCRETE ROUGHNESS ELEMENTS ON A VERTICAL HEATED WALL
S. Shakerin, M. S. Bohn (Midwest Research Inst., Golden, Colo.), and R. I. Loehrke Feb. 1986 9 p Presented at the International Heat Transfer Conference, San Francisco, Calif., 17 Aug. 1986 Prepared in cooperation with Solar Energy Research Inst., Golden, Colo.
(Contract DE-AC02-83CH-10093)
(DE86-004424; SERI/TP-252-2812; CONF-860805-7) Avail: NTIS HC A02/MF A01

Natural convection flow next to a heated wall with single and repeated, two-dimensional, rectangular roughness elements is studied numerically and experimentally. The objective is to determine how these roughness elements influence heat transfer rates from the wall. Each roughness element consists of a thermally conducting, horizontal cylinder of rectangular cross section attached to the heated, isothermal wall of an enclosure. The height of roughness is on the order of the boundary layer thickness. Dye flow visualization in water confirms the numerical prediction that the steady flow over these elements does not separate. Only at high Rayleigh numbers, when the boundary layer below the roughness is unsteady, is local instantaneous flow reversal observed. Although steady flow reversals near the wall are not predicted or observed, nearly stagnant regions are formed, particularly between closely spaced cylinders. The surface heat flux in these stagnant regions is relatively low, so the total heat transfer rate may be nearly the same as for a smooth wall in spite of the increased surface area. DOE

APPLICATION OF FLUX-CORRECTED TRANSPORT (FCT) TO HIGH RAYLEIGH NUMBER NATURAL CONVECTION IN A POROUS MEDIUM
R. J. Gross, M. R. Baer, and C. E. Hickox 1986 29 p Presented at the International Heat Transfer Conference, San Francisco, Calif., 17 Aug. 1986
(Contract DE-AC04-76DP-00789)
(DE86-004603; SAND-85-1552C; CONF-860805-4) Avail: NTIS HC A03/MF A01

A numerical technique designed to solve a wide class of convectively dominated flow problems is applied to natural convective flow in a porous medium at large Rayleigh number. The technique is a finite difference method based on flux-corrected transport (FCT) and possesses four desirable numerical properties: stability, accuracy, monotonicity, and conservation. Steady natural convection is investigated for Rayleigh numbers as large as 10,000. An efficient methodology for obtaining steady state solutions is illustrated. A simulation is performed for transient thermal convection at a Rayleigh number of 2500. Transient natural convection involving both heat and mass transfer is illustrated for a Rayleigh number of 2500, Lewis number of 2, and buoyancy ratio of 0.1. All simulations are performed in a square cavity with heated vertical side walls. DOE

DETONATION CELLULAR STRUCTURE AND IMAGE PROCESSING
J. E. Shepherd and S. R. Tieszen 1986 31 p Presented at the 21st International Symposium on Combustion, Munich, West Germany, 3 Aug. 1986
(Contract DE-AC04-76DP-00789)
(DE86-006467; SAND-86-0033; CONF-860804-8) Avail: NTIS HC A03/MF A01

Gaseous detonations universally exhibit an instability that is manifested as cellular patterns on witness plates (sooted foils) or open shutter photographs. The characteristic dimension or cell width lambda of the periodic cellular pattern has previously been shown to correlate with failure diameter, critical diffraction aperture dimension and direct initiation energy requirements. Due to the importance of predicting these parameters in assessing detonability hazards, a quantitative method for cell size mesurement is urgently needed. We discuss a technique based on digital image processing of sooted foil records and illustrate the results with data from experiments performed in the Heated Detonation Tube facility at Sandia. We demonstrate that image processing can be used to eliminate some of the uncertainty now present in cell size measurements. The possibility of quantifying cellular irregularity is also explored. GENERALIZATION OF ONE-DIMENSIONAL SOLUTE TRANSPORT: A STOCHASTIC-CONVECTIVE FLOW CONCEPTUALIZATION
C. S. Simmons Apr. 1986 14 p Presented at the 6th Annual AGU Front Range Branch Hydrology Days, Fort Collins, Colo., 16 Apr. 1986
(Contract DE-AC06-76RL-01830)
(DE86-011117; PNL-SA-13861; CONF-8604214-1) Avail: NTIS HC A02/MF A01

A stochastic-convective representation of one-dimensional solute transport is derived. It is shown to conceptually encompass solutions of the conventional convection-dispersion equation. This stochastic approach, however, does not rely on the assumption that dispersive flux satisfies Fick's diffusion law. Observable values of solute concentration and flux, which together satisfy a conservation equation, are expressed as expectations over a flow velocity ensemble, representing the inherent random processess that govern dispersion. Solute concentration is determined by a Lagrangian pdf for random spatial displacements, while flux is determined by an equivalent Eulerian pdf for random travel times. A condition for such equivalence is derived for steady nonuniform flow, and it is proven that both Lagrangian and Eulerian pdfs are required to account for specified initial and boundary conditions on a global scale. Furthermore, simplified modeling of transport is justified by proving that an ensemble of effectively constant velocities always exists that constitutes an equivalent representation. An example of how a two-dimensional transport problem can be reduced to a single-dimensional stochastic viewpoint is also presented to further clarify concepts. DOE

Contract W-7405-eng-36)
DE86-012406; LA-UR-86-2118; CONF-8606136-1) Avail: NTIS IC A02/MF A01

The partial differential equations (PDEs) describing the time volution of compressible fluid flow in two and three dimensions re usually solved numerically in the Eulerian frame of reference s opposed to the Lagrangian frame. This is especially true of lows involving large distortions. Lagrangian codes based upon agrangian cells do not run very long when the cells become istorted. In order to avoid the problem of cell distortion we have eveloped a Lagrangian code named HOBO based upon massless racer points. These tracer points can be thought of as being mbedded in, and moving with the fluid. The PDEs which we are rying to solve at each of the points are four equations which epresent conservation of mass, momentum and energy, and an quation of state. DOE

A VARIATIONAL PRINCIPLE FOR THE PLASMA CENTRIFUGE
Gerson Otto Ludwig Sep. 1986 13 p Presented at the 15th International Symposium on Rarified Gas Dynamics, Grado, Italy, Jun. 1986
(INPE-3989-PRE/992) Avail: NTIS HC A02/MF A01

A variational principle is derived which describes the stationary state of the plasma column in a plasma centrifuge. Starting with the fluid equations in a rotating frame the theory is developed using the method of irreversible thermodynamics. This formulation easily leads to an expression for the density distribution of the l-species at sedimentation equilibrium, taking into account the effect of the electric and magnetic forces. Assuming stationary boundary conditions and rigid rotation nonequilibrium states the condition for thermodynamic stability integrated over the volume of the system reduces, under certain restrictions, to the principle of minimum entropy production in the stationary state. This principle yields a variational problem which is equivalent to the original

problem posed by the stationary fluid equations. The variational method is useful in achieving approximate solutions that give the electric potential and current distributions in the rotating plasma column consistent with an assumed plasma density profile.

A new instrument has been developed to produce high resolution imagery in eight visible and three infared spectral bands from an aircraft platform. An analysis of the data and calibration procedures has shown that useful data can be obtained at up to 50 m resolution with a 2.5 milliradian aperture. Single sample standard errors for the measurements are 0.5, 0.2, and 0.9 K for the 6.5, 11.1, and 12.3 micron spectral bands, respectively. These errors are halved when a 5.0 milliradian aperture is used to obtain 100 m resolution data. Intercomparisons with VAS and AVHRR measurements show good relative calibration. MAMS development is part of a larger program to develop multispectral Earth imaging capabilities from space platforms during the 1990s. Author

Smoke meters with increased sensitivity, improved accuracy, and rapid response are needed to measure the smoke levels emitted by modern jet engines. The standard soiled tape meter in current use is based on filtering, which yields long term averages and is insensitive to low smoke levels. Two new optical smoke meter techniques that promise to overcome these difficulties have been experimentally evaluated: modulated transmission (MODTRAN) and photothermal deflection spectroscopy (PDS). Both techniques are based on light absorption by smoke, which is closely related to smoke density. They are variations on direct transmission measurements which produce a modulated signal that can be easily measured with phase sensitive detection. The MODTRAN and PDS techniques were tested on low levels of smoke and diluted samples of NO2 in nitrogen, simulating light adsorption due to smoke. The results are evaluated against a set of ideal smoke meter criteria that include a desired smoke measurement range of 0.1 to 12 mg cu.m. (smoke numbers of 1 to 50) and a frequency response of 1 per second. The MODTRAN instrument is found to be inaccurate for smoke levels below 3 mg/cu.m. and is able to make a only about once every 20 seconds because of its large sample cell. The PDS instrument meets nearly all the characteristics of an ideal smoke meter: it has excellent sensitivity over a range of smoke levels from 0.1 to 20 mg/cu.m. (smoke numbers of 1 to 60) and good frequency response (1 per second).

A calibration test is described that was performed to supplement the normal calibration of the 188 pressure transducers used in the Tip Aerodynamics and Acoustics Test. This calibration led to the identification of 15 transducers which had a slope change of greater than 7% from the initial calibration. The calibration procedure is described and the results presented. The effect of the slope changes on the pressure distributions are described, followed by a method to compensate for these changes. HC A03/MF A01 CSCL 14B

Buried Wire Gages operated from a Constant Temperature Anemometer System are among the special types of instrumentation to be used in the Boundary Layer Apparatus for Subsonic and Transonic flow Affected by Noise Environment (BLASTANE). These Gages are of a new type and need to be adapted for specific applications. Methods were developed to fabricate Gage inserts and mount those in the BLASTANE Instrumentation Plugs. A large number of Gages were prepared and operated from a Constant Temperature Anemometer System to derive some of the calibration constants for application to fluid-flow wall shear-stress measurements. The final stage of the calibration was defined, but could not be accomplished because of non-availability of a suitable flow simulating apparatus. This report provides a description of the Buried Wire Gage technique, an explanation of the method evolved for making proper Gages and the calibration constants, namely Temperature Coefficient of Resistance and Conduction Loss Factor.

METAL THICKNESS MEASUREMENTS USING RADIOGRAPHY Patent Application
P. M. Achrekar, inventor (to Air Force) Filed 16 Apr. 1986 11 p
(AD-D012373; US-Patent-Appl-SN-852683) Avail: NTIS
HC A02/MF A01 CSCL 11/6

The present invention relates broadly to a radiographic inspection technique, and in particular to a metal thickness measurement method using radiography. The localized areas wherein the effective metal thickness is less than the minimum that is required for radiation shielding and which can render a shielding enclosure functionless, is readily determined. The invention comprises a process for assuring metal thickness in small regions. The actual metal thickness of small regions can be verified by comparing the optical densities of sections of the metal i.e., stepwedge. A comparator microphotometer, which compares optical densities of spectrum lines from spectrophotometers, compares the optical density of spectrum lines on an exposed spectrum plate (metal under test) with a standard plate (stepwedge).

HIGH RESOLUTION OPTICAL FIBER PRINT HEAD Patent
Michael J. Meier, inventor (to Air Force) Issued 20 May 1986 4 p Supersedes AD-D010348
(AD-D012384; US-Patent-4,590,492; US-Patent-Appl-SN-502028; US-Patent-Class-346-107R) Avail: US Patent and Trademark Office CSCL 14/5

A high resolution printing head for a line printer using photographic recording medium has a plurality of modules connected to form a two dimensional printing array. Each module has three fiber optic ribbons bonded together to form a staggered array of fibers. An apertured mask is photolithographically attached to the two dimensional array so that there is one aperture positioned over each fiber. The aperture has a cross-section less than the fiber so there is no overlapping of output light from each fiber and the apertures are also staggered so that a three fold increase in line density is achieved over conventional single ribbon arrays.

The Phase 3 Two-Axis Gyro/Accelerometer (TAGA) cluster is a strapdown IMU (Inertial Measurement Unit) with prelaunch self-calibration capabilities. The self-calibration mechanism allows for computer directed self tests which measure eight major performance parameters prior to launch. The purpose of this evaluation is to confirm performance stability of these eight parameters. The performance stability will decide the method of thermal compensation. Author (GRA)

FIBER-OPTIC MAGNETIC GRADIOMETER WITH VARIABLE MAGNETIC BIASING FIELDS Patent
Kee P. Koo and George H. Sigel, Jr., inventors (to Navy) Issued 27 May 1986 10 p
(AD-D012423; US-Patent-4,591,786; US-Patent-Appl-SN-641656; US-Patent-Class-324-244) Avail: US Patent and Trademark Office CSCL 17/6

This patent discloses a fiber optic magnetic gradiometer for measuring both ac and dc magnetic field gradient. The gradiometer utilizes an optical interferometer with magnetostrictive magnetic field sensing elements in each of the interferometer arms. Ac and dc magnetic field biasing is achieved by disposing each of the magnetic field sensing elements within its own magnetic field coil and utilizing a variable dc current source for applying dc current to each magnetic coil. An ac current source at frequency w sub o connected across the circuits of the dc current sources is used in conjuction with a variable attenuator to control the ac bias to the respective magnetic coils. The detected output from the interferometer is processed either by bandpass filters or a spectrum analyzer to obtain the signal component w sub o, which is proportional to the external dc gradient magnetifc field, and at w sub o + w sub s, (where w sub s is external ac magnetic field frequency), which is proportional to the external ac magnetic field gradient. A spectrometer has been developed specifically for the X-ray laser effort at Lawrence Livermore National Laboratory (LLNL). The instrument takes advantage of the small divergence and size of the lasing source by positioning all three components - the source, a custom-ruled grating, and a microchannel plate (MCP) detector - on the Rowland circle. The sum of incident and diffracted angles is kept constant. Illuminating a pinhole at the source location with a z-pinch produces wavelength calibration at several energy ranges in the 65- to 200-eV interval. The same source used in conjunction with the MCP camera and Kodak 101 film yields the absolute detector efficiency. Ion bombardment of a beryllium target at the source location produces the X-rays necessary to determine the absolute efficiency of the grating-detector combination at 107 eV. Grating efficiency is then deduced from the MCP efficiency at that energy. Three 25- stripline structures on the MCP allow sub-nanosecond gating of the spectrometer, which improves the signal-to-background ratio. The rise time response of the entire MCP detector-cable assembly is about 200 ps. We also measured the transmission of the filters that are used in suppressing ultraviolet backgrounds. DOE

We present a new technique for measuring the energy spectrum of X-rays emitted by high-intensity, medium-voltage flash X-ray sources. The method sorts Compton electrons by drift velocity time-of-flight in a non-uniform magnetic field. We explain the conceptual design of the spectrometer, show how we have modeled it using Monte Carlo methods, and discuss the procedure for unfolding X-ray spectrum information from electron time-of-flight data. The technique appears promising, especially for short-pulse X-ray sources. DOE

1986 13 p
(Contract DE-AC02-78EV-04969)
(DE86-011576; DOE/EV-04969/T5) Avail: NTIS HC A02/MF A01

The 10cm chamber had been used in conjunction with the new reconstruction algorithm. Ongoing investigations are testing system performance, including three-dimensional resolution and contrast ratio for various objects. The chambers have experienced reliability problems, even with the 90% argon-10% ethane mixture. This new gas has helped stability somewhat, but we must still compromise sensitivity by running at less than desired anode voltages. This results in two effects: loss of anode events, and a reduced number of valid cathode events. This translates into a reduced coincidence event rate. Some electronic problems have also developed, resulting in the loss of one anode amplifier in chamber 1 and a non-uniform cathode sensitivity in chamber 2.

DOUBLE-ENDED TUNING FORK QUARTZ ACCELEROMETER
W. J. Kass and G. S. Snow 1986 22 p Presented at the 40th Annual Symposium on Frequency Control, Philadelphia, Pa., 28 May 1986
(Contract DE-AC04-76DP-00789)
(DE86-012277; SAND-86-0219C; CONF-8605156-1) Avail: NTIS HC A02/MF A01

Quartz accelerometers with frequency output have been designed and built using etched double-ended tuning fork technology. These devices consist of two tuning forks connected in a cantilever beam configuration with beryllium-copper spacers which serves as a proof mass and inboard spacer. The frequency outputs of each tuning fork resonant circuit are mixed to yield an output frequency of approximately 1kHz at zero acceleration. The sensitivity of the devices is approximately 1Hz/G. The fundamental vibration frequency of the cantilever beam is 2200Hz in this undamped device. Shock testing up to 1500G has indicated good survivability characteristics. Individual fork measurements compared with assembled cantilevers tested in a +- 1G field in the temperature range of -55C to +85C indicate that residual stresses associated with assembly contributes to the temperature sensitivity of the bias frequency. Centrifuge testing has been conducted over the range of 0-120G with an indicated non-linearity of less than 2mG.

Novel free electron laser (FEL) resonator concepts employing nonlinear optics techniques were developed in support of advanced FEL technologies. Among these concepts, three major schemes were studied for details as to their potential applications to the ground-based FEL systems: phase conjugate cavity and phase conjugate outcoupling for RF linac FEL resonators, and phase conjugate beam conversion for induction linac FEL devices. These schemes involve the utilization of some novel nonlinear optics techniques that have received very little attention before: multiple pulse stimulated Brillouin scattering, short-pulse four wave mixing, and four wave stimulated Brillouin scattering. Theoretical studies, modeling and proof of principle experiments have been performed to explore these phenomena. The analytical theory and numerical simulation showed the feasibility of these techniques to meet the system requirements and also determined parametrically the operational conditions. The experiments for short-pulse four wave mixing and four wave stimulated Brillouin scattering were conducted in carbon disulfide and acetone media, respectively. The results verified the scaling relations and demonstrated high conjugate reflectivities (about 1000) for a weak signal.

HIGH GAIN FREE ELECTRON LASER OSCILLATORS
W. P. Marable, P. Sprangle, and Cha-Mei Tang 6 Jun. 1986 21 p
(AD-A169002; NRL-MR-5679) Avail: NTIS HC A02/MF A01 CSCL 20/5

We have carried out a fully relativistic, nonlinear analysis of the spatial and temporal evolution of multiple modes within a free electron laser oscillator. The analysis is both analytical and numerical, and is conducted self-consistently with the framework of the Vlasov-Maxwell system of equations, including the collective effects produced by the longitudinal space-charge wave potential. The analytic calculation of the small signal gain yields a dispersion relation for the moderate to high gain (Gamma L > 1) operation of the free electron laser. The numerical simulations verify the analytic results for the linear gain regime and predicts high efficiencies for the nonlinear saturated state of the radiation fields.

Research efforts were concentrated on passive ring laser rotation sensor technology. Initial efforts were performed on supportive projects, e.g., laser stabilization, followed by a 0.62 sq m passive resonant ring laser gyro (PRRLG), leading to the development of a 60 sq m system mounted on the pneumatically supported isolation test platform (Iso-Pad) at FJSRL. Numerous sub-system tasks and a feasibility 0.62 sq m PRRLG were completed, supporting projections of very high resolution performance by a large 60 sq m PRRLG. The expected performance of the large PRRLG, on the order of 10 to the minus 10th power ERU (earth rate units), would provide an accurate error model applicable to Air Force operational ring laser gyros, a new source of geophysical data, e.g., earth wobble and variations in earth rotation, a proven design concept applicable to Air Force sensor needs as reference to MX instruments tests, and relativity experiments. This report documents the many accomplishments leading to, and the status of the large PRRLG at the date of the PRRLG stop order, November 1985. GRA

The performance of the free electron laser for the directed energy weapons application depends critically on only three technologies: the high brightness accelerator, the FEL amplifier, and the cavity optics. The goal of this program is to examine the performance of the optical elements under the combined loading of the fundamental and the harmonic emissions of the FEL amplifier. The performance of both the RF linac based FEL and the induction linac based FEL may be subject to significant limitations due to UV-induced absorption in the early optical elements following the FEL amplifier. These limitations are expected to appear suddenly at a certain fluence level, with little warning. Our central objective in this program is to measure the rate of the UV induced absorption, and to identify the scaling parameters so that we can predict with some confidence the performance limitations of the optics. When these limits are reached in the experimental programs, a knowledge of the scaling relations and possible countermeasures will be invaluable in planning an appropriate response to the problem. CYLINDRICAL LASER WELDER Patent Application
Thomas E. Honeycutt and Thomas G. Roberts, inventors (to Army) Filed 15 May 1986 7 p
(AD-D012398; US-Patent-Appl-SN-864638) Avail: NTIS HC A02/MF A01 CSCL 13/9

Brass retainer rings are currently fastened to artillery shells by spinning each shell at a high rate and then jamming the ring on it so that it is fastened or welded by friction between the two objects. This is an energy-inefficient process which heats and weakens more material than is desirable. The shell spinning at a high rate is also potentially dangerous. A laser welder is provided that generates output energy focused on a circular or cylindrical shape for simultaneously welding around a 360 degs circumference without unnecessarily heating large amounts of material. The welder may be used to fasten cylindrical shaped objects, gears and shafts together, which is difficult to do by conventional means. The welder may also be used to fasten one cylinder to another. To accomplish the welding, a laser has an unstable optical cavity arranged with its feedback mirror centered to generate a circular output beam having an obscuration in the center. A circularly-symmetric, off-axis concave mirror focuses the output beam onto the objects being fastened and away from the center line or axis of the circular beam. GRA

Theoretical techniques have been developed to describe a variety of laser-induced molecular rate processes occurring at solid surfaces which are involved in heterogeneous catalysis. Such processes include adsorption, migration, chemical reactions and desorption. The role of surface phonons in laser-selective processes and laser heating has been analyzed. The importance of electronic degrees of freedom has been considered for semiconductor and metal substrates, with special emphasis on the laser excitation of surface states. Surface-modified photochemistry has also been investigated, where the effect of a metal surface on the resonance fluorescence spectrum of a laser-driven atom/molecule has been assessed by means of surface-dressed optical Bloch equations. It is seen that the spectrum can be significantly different from the gas-phase case. Two related gas-surface collision processes have also been studied. First, the feasibility of the formation of the electron-hole pairs in a semiconductor by vibrationally excited molecules has been explored. Second, charge transfer in ion-surface collisions has been examined for both one-electron and two-electron transfer processes. Work has been initiated on microstructures and rough structures, including clusters and surface gratings. GRA

(Contract F29601-83-C-0048)
(AD-A169781; SC5366.51FR; AFWL-TR-85-04) Avail: NTIS HC A05/MF A01 CSCL 20/5

Electronic-to-electronic (E-E) energy transfer from NF(b superscript 1 sigma +) to IF(X superscript 1 sigma +), producing IF(B superscript 3 Pi(O+)), was investigated using both spatially resolved data from a chemiluminescence flow tube apparatus and temporarily resolved data following pulsed excitation in a flow tube. The b superscript 1 sigma + state of NF was generated by the F-HN3 reaction under steady-state flow tube conditions and by the NF(a superscript 1 delta)+I* pooling reaction for the temporally resolved studies. Results of this study show that the source of IF(B superscript 3 Pi(O+)) in these chemiluminescence reactions stems from E-E energy transfer, that the rate of the transfer reaction depends strongly on the vibrational distribution in the ground state of IF, that the rate is independent of the vibrational distribution in the NF(b superscript 1 sigma +), and that the efficiency of the transfer rate is greater than 20%. The rate constant for the E-E energy transfer was measured to be 1.5 + or - 0.2 x 10 to the

-11 power cc/molecule/s for an IF(x superscript 1 sigma +) vibrational distribution corresponding to 800 K. These results are explained in terms of an energy transfer mechanism requiring that the individual state-to-state rates are proportional to the probabilities associated with vertical transitions. We investigate through numerical simulation the advantages of a multicavity linac for improving the quality of the electron beam due to the technique of phase synchronism. This will also increase the shunt resistance of the accelerator which is desirous if very high energy is the goal. However, if a particular energy is required, then the shunt resistance must be held constant. Fortunately, a cavity's quality factor, Q, is approximately inversely proportional to its length if its aspect ratio is much less than one. Therefore, the shunt resistance can be controlled by varying the length of the cavities. GRA

Principal progress was achieved in the field classical studies of diatom dissociation. 3-D trajectory calculations of dissociating bromine and fluorine were conducted over a range of temperatures, and using several significantly different potential energy surfaces. A library consisting over a two million trajectories was accummulated. These trajectories were used to test the strong collision assumption, important in several theories of unimolecular reactions and in some theories of thermal diatom dissociation. The assumption was shown to be not valid for the case of dissociating bromine and fluorine. Properties of the steady state of dissociating diatoms were investigated. Papers, now in preparation, involve study of nonequilibrium energy and angular momentum distribution functions; accumulation, interpretation and classification of data on inelastic and reactive collisions; and study of scaling factors and vibrational-rotational coupling in dissociating diatoms. Experiments, still in progress, aimed at measuring recombination rates of fluorine atoms. Time delayed photoelectric effect was explained in terms of a release of trapped electrons at the surface of photocathode. GRA

Two dense plasma focus systems, the hypocycloidal pinch and the Mather type were investigated as the potential excitation light sources for high energy, short wavelength lasers. Using the hypocycloidal pinch (HCP), extensive lasing experiments were successfully performed, for the first time, on organic dyes producing results indicative of the capabilities and limitations the HCP system as an optical pump. A proof of principle lasing experiment was also performed for the first time using the Mather type dense plasma focus (MDPF) sucsessfully. Results thus far indicate that both HCP and MDPF are excellent high energy, short wavelength optical pumps and that as an optical pump, the MDPF system is more versatile, efficient, and powerful than the HCP system, especially in the short wavelength spectral region. RESONANT PHOTON PUMPING MECHANISMS FOR A PLASMA X-RAY LASER Patent
Raymond C. Elton, inventor (to Navy) Issued 27 May 1986 7 p
Supersedes AD-D010901
(AD-D012416; US-Patent-4,592,056; US-Patent-Appl-SN-569686; US-Patent-Class-372-5) Avail: US Patent and Trademark Office CSCL 20/5

This patent discloses a lasing system for lasing at X-ray wavelengths. In one embodiment, a neon-like sulfur ion S(6+) plasma is caused to radiate on its 3d to 2 p transition to pump a lithium like neon Ne(7+) plasma to obtain X-ray lasing. In a second embodiment, a lithium-like silicon Si(11+) ion plasma is caused to radiate on the 3d to 2p transition to pump lithium like magnesium Mg(9+) plasma to obtain X-ray lasing. GRA

LASER PRODUCED X-RAY FOR HIGH RESOLUTION LITHOGRAPHY AND A PHOTOIONIZATION LASER Final Report
Harold Epstein, Dave Applebaum, and Bernerd Campbell 14 Feb. 1986 83 p
(Grant AF-AFOSR-0066-82)
(AD-A170782; AFOSR-86-0553TR) Avail: NTIS HC A05/MF A01 CSCL 20/8

The majority of the project was spent investigating laser produced X rays for high resolution lithography. This work involved measurements over an extensive parameter matrix. Specifically, efficiency of conversions to X rays was qualified as a function of: (1) laser pulse energy, (2) laser pulse width, (3) plasma profile, (4) laser wavelength, (5) target atomic number, (6) initial focal area, and (7) focal ratio of the lens. Experimental research was performed on a photoionization X ray laser concept. Specifically, a thin polyethylene, oxidicarbonate film was vaporized. Fifteen nanoseconds into its expansion, the vapor was illuminated by a 200 psec Fe spectrum X ray pulse. Photoionization of the inner K shell of oxygen was then observed. The potential efficiency of this type of laser was found to be comparatively low. GRA

POPULATION INVERSIONS IN LASER-INITIATED VACUUM ARCS Final Report, 1 Feb. 1981 - 31 Jan. 1986
Mahadevan Krishnan and Gary L. Haller 17 Jun. 1986 77 p
(Grant AF-AFOSR-0077-81)
(AD-A170811; AFOSR-86-0522TR) Avail: NTIS HC A05/MF A01 CSCL 20/3

Population inversions were studied in laser initiated vacuum arcs. Inversion mechanisms include three body recombination pumping in expanding, laser produced plasmas, and resonant photoexcitation using line radiation. Significant gain was measured on the Balmer lines H sub alpha and H sub beta in expanding, laser produced plasmas of carbon/polyethylene. Research then focused on resonant photoexcitation of one ion by line radiation from another ion. Fluorescence was measured at UV wavelengths in CII pumped by Al III. A new class of photoexcited lasers was identified, in Be like ions, with wavelengths from 2177A in C III pumped by Mn VI, to 200 A in Mg IX pumped by Al XI. Fluorescence

and small signal gain were measured in C III pumped by Mn VI. Finally, laser oscillation was demonstrated in C III at 2177 and 2163A. These are the first UV lasers to be pumped by resonant photoexcitation. By isoelectronic scaling, it should be possible to produce soft X-ray lasers using the principles elucidated by this research. Photopumped lasers could prove to be the most efficient soft X-ray lasers in the future. GRA

KINETIC AND THERMODYNAMIC STUDIES OF PULSED LASER IRRADIATION
P. S. Peercy and M. O. Thompson 1986 10 p Presented at the Society of Photo-Optical Instrumentation Engineers International Symposium: Topics in Optical and Optoelectronic Applied Sciences and Engineering, Quebec City, Canada, 2 Jun. 1986 Prepared in cooperation with Cornell Univ., Ithaca, N.Y.
(Contract DE-AC04-76DP-00789)
(DE86-012175; SAND-85-2830C; CONF-860620-8) Avail: NTIS HC A02/MF A01

Simultaneous measurements of the transient conductance, to determine the molten layer thickness versus time, and the time-dependent surface reflectance, to determine the melt duration at the surface during pulsed laser irradiation, are reviewed. These real-time measurements have been applied in a variety of studies of Si and Si-based alloys. In crystalline Si, melt initiates at the surface and propagates to some depth, whereupon the motion of the liquid/solid interface reverses and the material solidifies. In amorphous Si, these measurements were used to determine the melting temperature of the amorphous phase and the mechanism by which explosive crystallization occurs. In Si implanted with impurities, combined transient conductance and reflectance measurements reveal the occurrence of such novel melt and solidification scenarios as internal nucleation of melt and surface nucleation of solid on molten Si. Internal melts, which were previously unexpected, appear to be quite common and explain unusual microstructures observed by TEM. DOE

REACTOR-PUMPED LASER EXPERIMENTS IN THE SANDIA SPR-3 FACILITY
D. A. McArthur, G. N. Hays, D. R. Neal, P. S. Pickard, and J. K. Rice 1986 15 p Presented at the Fast Burst Reactor Workshop, Albuquerque, N. Mex., 8 Apr. 1986
(Contract DE-AC04-76DP-00789)
(DE86-012163; SAND-86-1011C; CONF-860420-4) Avail: NTIS HC A02/MF A01

Experiments on the excitation of short-wavelength gas lasers have recently been performed in the central cavity of the Sandia fast burst reactor SPR-III. Small-signal gain coefficients approx. 0.7%/cm were measured in XeF laser mixtures excited with either the He-3 (n,p)T reaction or with fission fragments emitted from the wall of the laser cell. Specialized apparatus helpful in performing these measurements is described. Preliminary experiments included measurement of radiation effects on cell window materials and laser mirrors, and measurement of energy deposition in the laser gas as a function of time for various cell geometries and polyethylene moderator thicknesses. The optical distortion of the laser medium by the energy deposition process was much more severe for fission fragment excitation. Fluorescence spectra were also measured for XeF laser mixtures with an optical multichannel analyzer, and these spectra were consistent with the XeF gain measurements. DOE

COMPARISON OF RAYLEIGH-TAYLOR GROWTH WITH 1.0 M AND 0.25 M LASERS
M. H. Emery, J. H. Gardner, and S. E. Bodner 29 May 1986 13 p
(DE86-012217; NRL-MR-5796) Avail: NTIS HC A02/MF A01

It is shown through numerical simulation that the Rayleigh-Taylor growth rate in laser-ablatively accelerated targets is reduced below the classical value (kg)(sup 1/2), by factors of 3 to 4 with 0.25 micron laser light. The simulation results are supported by an analytical expression for the growth rates. These results provide further evidence for the viability of high-aspect ratio shells in direct-drive laser fusion. DOE

CO SUB 2 LASER SUSTAINED CW DISCHARGE ATOMIC BEAM SOURCE
J. B. Cross, D. A. Cremers, L. H. Spangler, M. A. Hoffbauer, and F. A. Archuleta 1986 11 p Presented at the 15th International Symposium on Rarefied Gas Dynamics, Grado, Italy, 16 Jun. 1986
(Contract W-7405-eng-36)
(DE86-012383; LA-UR-86-1943; CONF-860636-3) Avail: NTIS HC A02/MF A01

A high pressure, supersonic, laser sustained plasma nozzle beam source was developed for the production of intense (greater than 10 to the 19th power particles/s/sr) beams of atomic and/or radical species having kinetic energies in the range of 1 to 10 eV. A high plasma temperature (10 to 30,000 K) is produced in the throat of a hydrodynamic expansion nozzle by sustaining a CW optical discharge in a gas using a high power CW CO2 laser. Gas mixtures are expanded through the nozzle/discharge region creating energetic atoms and molecules. An oxygen atom beam was produced with a kinetic energy of 2 to 3 eV and an intensity of approximately 10 to the 18th power O-atoms/s/sr. O-atom collisions (1 eV) from an uncharacterized nickel surface shows strong specular scattering with approximately 50% energy loss to the surface. Argon beams having kinetic energies between 5 to 10 eV with intensities of greater than 10 to the 19th power atoms/s/sr were also produced. DOE

THEORY AND SIMULATION OF HIGH-BRIGHTNESS ELECTRON BEAM PRODUCTION FROM LASER-IRRADIATED PHOTOCATHODES IN THE PRESENCE OF dc AND RF ELECTRIC FIELDS
M. E. Jones and W. Peter 1986 14 p Presented at the 6th International Conference on High Power Particle Beams, Kobe, Japan, 9 Jun. 1986
(Contract W-7405-eng-36)
(DE86-012384; LA-UR-86-1941; CONF-860665-7) Avail: NTIS HC A02/MF A01

To take advantage of properties of laser-controlled photodiodes to produce electron beams, a new set of diode design criteria are needed. An analytical and numerical study of the geometrical and temporal factors that affect the design of high-brightness electron beams is presented. This study extends our previous work on this concept to include the effects of laser pulse shape, and emittance effects in the presence of RF fields. In general, the diode will not be space-charge limited. Therefore, the conventional Pierce electrode shapes are not appropriate. Furthermore, the finite temporal profile of the electron beams introduces a time-dependent space charge into the design problem. The approach taken here to minimize the emittance growth from the temporal profile of the space charge is to operate at low perveance. To obtain high currents, large electric fields are required. We exploit the fact that the electron emission is controlled by the laser and is independent of the voltage on the diode. The diode can then be driven by an rf field. In principle, operating at higher frequency allows higher breakdown limits, so the perveance can be made very small. However, operating at too high an RF frequency introduces other detrimental effects. DOE

HC A02/MF A01

The development of coherent radiation in high-gain free electron lasers, either from initial noise or from low-power input radiation, is analyzed in terms of three-dimensional Maxwell-Klimontovich equations. Exponential growth and saturation, transverse radiation profiles, transverse coherence and spectral features are discussed. Two possible systems of high-gain free electron lasers, one based on a storage ring and by-pass, another based on a linac and damping rings, are considered for the generation of 400 A radiation. DOE

MOESSBAUER-BORRMANN SUPERRADIANCE
G. C. Baldwin, M. S. Feld, J. P. Hannon, J. T. Hutton, and G. T. Trammell 1986 12 p Presented at the International Colloquium on X-ray Lasers, Aussois, France, 14 Apr. 1986 Prepared in cooperation with Massachusetts Inst. of Tech. and Rice Univ.
(Contract W-7405-eng-36)
(DE86-012373; LA-UR-86-2010; CONF-8604224-2) Avail: NTIS HC A02/MF A01

The kinetic behavior of a gamma-ray laser is comprised of an array of isomeric nuclei located at regular lattice sites in a perfect single crystal of dimensions and structure so chosen as to favor anomalous emission into that Borrmann mode having the maximum possible number of component Bragg-reflected beams, which greatly reduces the excitation requirements. The analysis of several hypothetical systems shows that superradiance, rather than amplified spontaneous emission, will then be the preferred mode of deexcitation, provided the nuclei can be pumped rapidly to a short-lived Moessbauer level while preserving crystal integrity. This warrants a search for solutions to the major problems: candidate nuclides, preparation of a storage isomer, and interlevel transfer from storage to lasing state. DOE

ON THE DEXTERITY OF ROBOTIC MANIPULATORS Ph.D. Thesis
ZoneChang Jim Lai 1986 195 p
Avail: Univ. Microfilms Order No. DA8606465

The dissertation deals with the dexterity of 6R manipulators. It consists of four parts. In the first part, the characteristics of a robot's service angle to a given point are studied by introducing the concepts of service sphere and free service region. It is shown that the entire service angle can be categorized into a number of free service regions. The relationship between the service angle and service regions is subsequently formulated into a set of theorems and criteria. In the second part, the singularity problem of six-link robots is investigated. This problem is studied by introducing the concepts of singular state with finite internal degree-of-freedom and singular state with infinitesimal internal degree-of-freedom. A set of theorems and corollaries about a robot's singular states are presented. The third part investigates the motion characteristics of a six-link robot when its hand is considered to be attached to a given point with a ball-and-socket joint. The characteristics of the locus of joint six in the neighborhood of some interesting points is studied. The fourth part studies the dexterity of various wrist structures. In this part, a general wrist, with its last link having common normal and twist angle equal zero, is first investigated. Later, both Euler-Angle and Roll-Pitch-Yaw wrists are studied in detail. Conditions which govern the superiority between these two wrist structures over each other are derived. Dissert. Abstr.

FRICTIONAL AND RETARDING FORCES ON AIRCRAFT TYRES. PART 4: ESTIMATION OF EFFECTS OF YAW
Sep. 1986 29 p
(ESDU-86016-Pt-4; ISBN-0-85679-568-2; ISSN-0141-4054) Avail: ESDU

Available as part of the ESDU Sub-series on Aircraft Performance, this ESDU gives expressions and data for calculating the forces and moments acting on the tire-ground contact area during unbraked and braked yawed rolling. The methods have been verified against experimental data drawn from a wide range of sources in the literature for speeds up to 100 knots, for a wide range of tire sizes, inflation pressures, vertical loads and runway surface conditions. Applications include estimation of minimum control speed on the ground and investigation of stopping performance with asymmetric reverse thrust and/or asymmetric braking and/or cross winds and/or low friction surface. THE EVALUATION OF A NUMBER OF PROTOTYPES FOR THE FREE-TIP ROTOR CONSTANT-MOMENT CONTROLLER
Larry A. Young Feb. 1986 76 p
(NASA-TM-86664; A-85059; NAS 1.15:86664) Avail: NTIS HC A05/MF A01 CSCL 01C

The development of several prototypes of a constant moment controller, a critical component of the free-tip rotor (FTR) concept, is described. Also presented are the experimental results of a whirl test designed to select a final controller configuration to be included in a future wind-tunnel test of this innovative rotor system. A brief explanation of the FTR concept and its history are included. The paper documents the controller design constraints, each prototype's operating principle, the evaluation test, and the individual prototype test results. A recommended design is identified, along with the selection rationale. Author

DIESEL CYLINDER GAS-SIDE HEAT FLUX TO A CERAMIC SURFACE Final Report, 18 May 1981 - 30 Jun. 1985
Gary L. Borman and Jeffrey C. Huang 1 Jun. 1986 42 p
(Contract DAAG29-81-K-0082)
(AD-A168948; ARO-18188.3-EG) Avail: NTIS HC A03/MF A01 CSCL 21/7

Results of four research projects each dealing with instantaneous heat flux to the cylinder head of reciprocating engine are given. The projects are: heat flux measurements in a diesel engine with variations in injection pressure, nozzle tips and swirl; development of instrumentation for radiation measurements in a diesel cylinder; heat flux measurements to various surfaces on the head of diesel engine including a normaly cooled metal surface, an insulated metal surface and a zirconia surface; and initial attempts to simultaneously measure the fluid motion and heat flux in a motored engine boundary layer. The variation of injection pressure nozzle tips and swirl in a direct injection diesel showed strong coupling between combustion and heat flux. An instrument for radiation measurement which uses a wall jet to reduce convection is described. Compression of the jet by the combustion heat release prevents zeroing of the convection. The major portion of the research was devoted to heat flux measurements to the surface of an instrumentation plug in the head of a single

COM-LABECO diesel. Comparisons made between data for ulated and uninsulated surfaces show that the hot metal surface ve reduced time averaged heat transfer, but gave a higher peak at flux than a normally cooled surface. Data for zirconia plate face showed a reduction in peak flux which was larger than dicted from the rise in surface temperature alone. GRA

PER GRIPPER VARIABLE VANE ARM Patent Application
E. Ludwick, inventor (to Air Force) Filed 27 Mar. 1986 12 p
D-D012364; US-Patent-Appl-SN-844636) Avail: NTIS A02/MF A01 CSCL 13/5

This patent application discloses a variable vane assembly ch entails a vane arm which integrally engages with a vane m without the use of threaded fasteners. The vane stem has a with parallel slots on opposite sides which are spaced below end of the tip. At the end of the tip is an end slot which is pendicular to the parallel slots. The tip of the vane stem has a ped side parallel with the end slot. The vane arm is a flat e metal strip that serves as the vane blade and integrally nects with the end slot. The vane arm is a flat wide metal that serves as the vane blade and integrally connects with vane stem using two ears, which are turned inwards to age with the parallel slots in the vane stem. Additionally, a tral leaf exists between the two ears which turns downwards it in the end slot in the tip of the vane stem. The central leaf thereby acts as an axial retainer and allows the vane arm to be rotated with the rotation of the vane stem. GRA

The role of convection in weld pools is of great interest due to its effect on weld pool shapes and weld defects. A quantitative understanding of convection in the weld pool is being developed. In this part of the effort major emphasis has been to model surface tension driven flow. The Lorentz force effect is incorporated towards the end of the two year effort. The significant achievements of the program are: (1) Stagnation flow analysis for center of the weldpool which provided algebraic expressions for temperature and velocity. This solution clarifies the scaling problems; (2) Three dimensional axisymmetric model for surface tension driven flow with flat surface assumption which predicted the pool shape for stationary heat source such as in the case of spot welds; (3) Three dimensional perturbation model for surface tension driven flow with flat surface which predict velocity field, temperature field, effect of trace elements and self-consistent prediction of the pool shape and cooling rate; (d) Three dimensional model with flat and free surface which predicted same as above with more realistic boundary condition. This model can also predict effect of Lorentz Force. A series of controlled experiments has been carried out to verify pool shape and liquid velocity. This verified the trend predicted by the model. INTEGRATING COMPUTER VISION WITH A ROBOT ARM SYSTEM M.S. Thesis
James E. Wingate 1986 51 p
(AD-A171278; AFIT/CI/NR-86-127T) Avail: NTIS HC A04/MF A01 CSCL 17/8

The goal of this project is to interface an image processing system to a robot arm system. Computer vision is used to compute the location and orientation of a block in the work space so that the block may be grasped and manipulated by a robot arm. A detailed explanation of how information flows from the image processor to the robot arm system is given. This flow can be broken down into three different steps. In the first step, a gradient map from a digitized image of the work space is transferred, one line at a time, from the Grinnell image processor to its host, a VAX 11/750. As each line of the gradient map is uploaded, the coordinates of pixels on the edges of a block (edge pixels) are stored in an array. Storing the coordinates of only the edge pixels results in significant image compression. The second step involves processing the edge pixel coordinate array to extract relevant features. The location of the corners of a block is all that is needed to compute the location of the centroid and the orientation of the block in the work space. In step three, the centroid and roll ang le information is sent from the VAX to the robot arm system host, a DUAL microcomputer. One of the robot arms is selected and appropriate commands are sent to that arm to grasp and manipulate the block. GRA

HEAT MEASUREMENTS IN INERTIA WELDING OF ALUMINUM TO STEEL
R. J. Reagan Jun. 1986 21 p
(Contract DE-AC05-84OR-21400)

DE86-012463; Y/DW-627) Avail: NTIS HC A02/MF A01
Measurements of the total heat generated at the interface during ertia welding of 316 stainless steel to aluminum-1100 (99.5% ure) at the Oak Ridge Y-12 Plant are presented. Transient emperature measurements of the weld are also given. A full eatment of calorimetric methods is included in the discussion. In easuring the heat generated during the weld, it was found that e conversion efficiency of kinetic energy in the flywheel to ctional heat energy at the interface is greater than 85%. DOE
